DICTIONARY
OF
PHILOSOPHY AND PSYCHOLOGY

DICTIONARY OF PHILOSOPHY AND PSYCHOLOGY

INCLUDING

MANY OF THE PRINCIPAL CONCEPTIONS OF ETHICS, LOGIC, AESTHETICS,
PHILOSOPHY OF RELIGION, MENTAL PATHOLOGY, ANTHROPOLOGY,
BIOLOGY, NEUROLOGY, PHYSIOLOGY, ECONOMICS, POLITICAL
AND SOCIAL PHILOSOPHY, PHILOLOGY, PHYSICAL
SCIENCE, AND EDUCATION

AND GIVING

A TERMINOLOGY IN ENGLISH, FRENCH, GERMAN, AND ITALIAN

WRITTEN BY MANY HANDS

AND EDITED BY

JAMES MARK BALDWIN

PH.D. (PRINCETON), HON. D.Sc. (OXON.), HON. LL.D. (GLASGOW)

STUART PROFESSOR IN PRINCETON UNIVERSITY

*WITH THE CO-OPERATION AND ASSISTANCE OF AN INTERNATIONAL
BOARD OF CONSULTING EDITORS*

IN THREE VOLUMES

WITH ILLUSTRATIONS AND EXTENSIVE BIBLIOGRAPHIES

VOL. II

New York
THE MACMILLAN COMPANY
London
MACMILLAN AND CO., LIMITED

1902

Oxford

HORACE HART, PRINTER TO THE UNIVERSITY

COLLABORATORS

Signatures.

(J. M. B.) Professor J. MARK BALDWIN, Princeton University.

EDITOR:

CONSULTING EDITORS:

For English.

- (J. D.) Professor JOHN DEWEY, Chicago University.
(W. J.) Professor WILLIAM JAMES, Harvard University.
(E. B. P.) Professor E. B. POULTON, Oxford University.
(A. S. P. P.) Professor ANDREW SETH PRINGLE-PATTISON, Edinburgh University.
(H. S.) Professor H. SIDGWICK¹, Cambridge University.
(G. F. S.) Dr. G. F. STOUT, University Reader, Oxford.

For French.

- (Y. D.) Professor YVES DELAGE, Sorbonne (Faculté des Sciences), Paris.
(Th. F.) Professor TH. FLOURNOY, Geneva University.
(P. J.) Professor PIERRE JANET, Collège de France.
(L. M.) L. MARILLIER¹, Lecturer, Sorbonne (Hautes Études), Paris.

For German.

- (S. E.) Professor S. EXNER, Vienna University.
(K. G.) Professor K. GROOS, University of Giessen.
(H. M.) Professor HUGO MÜNSTERBERG, Harvard University.
(Th. Z.) Professor TH. ZIEHEN, University of Utrecht.

For Italian.

- (E. M.) Professor E. MORSELLI, Genoa University.
(G. V.) Professor G. VILLA, Liceo Tasso, Lecturer, University of Rome.

ASSOCIATE EDITORS:

For Logic and Psychology.

- (C. L. F.) Mrs. C. LADD-FRANKLIN, Baltimore.

For Bibliography.

- (H. C. W.) Professor H. C. WARREN, Princeton University.

EDITOR'S ASSISTANTS:

For Biography.

- Professor G. A. TAWNEY, Beloit College.

For Philology.

- Professor W. M. URBAN, Ursinus College.

CONTRIBUTORS²:

Philosophy.

- (A. C. A. Jr.) Professor A. C. ARMSTRONG, Jr., Wesleyan University.
(B. B.) Dr. B. BOSANQUET, Oxshott, Surrey, England.
(J. D.) Professor JOHN DEWEY, Chicago University.
(H. N. G.) Professor H. N. GARDINER, Smith College.
(G. E. M.) G. E. MOORE, Fellow of Trinity College, Cambridge.
(A. S. P. P.) Professor ANDREW SETH PRINGLE-PATTISON, Edinburgh University.
(J. R.) Professor JOSIAH ROYCE, Harvard University.
(E. T. S.) Professor E. T. SHANAHAN, Catholic University, Washington.
(R. H. S.) R. H. STETSON, Harvard University.

Logic.

- (R. A.) Professor R. ADAMSON¹, Glasgow University.
(C. L. F.) Mrs. C. LADD-FRANKLIN, Baltimore.
(C. S. P.) Dr. C. S. PEIRCE, Milford, Pike Co., Pennsylvania.

Ethics.

- (J. S.) Professor JAMES SETH, Edinburgh University.
(W. R. S.) Professor W. R. SORLEY, Cambridge University.

¹ Deceased.

² The names of contributors are given in this list under one subject only, although in many cases they have written in other subjects as well.

CONTRIBUTORS

Psychology.

- (J. McK. C.) Professor J. McK. CATTELL, Columbia University.
 (E. C. S.) Professor E. C. SANFORD, Clark University.
 (E. M. S.) Mrs. H. SIDGWICK, Principal, Newnham College, Cambridge.
 (G. F. S.) Dr. G. F. STOUT, University Reader, Oxford.
 (E. B. T.) Professor E. B. TITCHENER, Cornell University.
 (H. C. W.) Professor H. C. WARREN, Princeton University.
 (J. M. B.) The Editor.

Philology.

- (B. I. W.) President B. I. WHEELER, University of California.

Physical Science and Mathematics.

- (J. S. A.) Professor J. S. AMES, Johns Hopkins University.
 (E. W. D.) Professor ELLERY W. DAVIS, University of Nebraska.
 (H. B. F.) Professor H. B. FINE, Princeton University.
 (S. N.) Professor SIMON NEWCOMB, Washington.

Mental Pathology and Anthropology.

- (J. J.) Professor J. JASTROW, Wisconsin University.
 (A. M.) Dr. ADOLF MEYER, Worcester, Mass., Insane Asylum.

Biology.

- (C. B. D.) Professor C. B. DAVENPORT, Chicago University.
 (E. S. G.) E. S. GOODRICH, Lecturer, Oxford University.
 (C. S. M.) Professor C. S. MINOT, Harvard University.
 (C. LL. M.) Principal C. LLOYD MORGAN, University College, Bristol.
 (E. B. P.) Professor E. B. POULTON, Oxford University.
 (W. F. R. W.) Professor W. F. R. WELDON, Oxford University.

Economics.

- (A. T. H.) President A. T. HADLEY, Yale University.

Political and Social Philosophy.

- (J. B.) Dr. JAMES BONAR, Civil Service Commission, London.
 (F. H. G.) Professor F. H. GIDDINGS, Columbia University.
 (F. C. M.) F. C. MONTAGUE, Oriel College, Oxford.
 (W. D. M.) Dr. W. D. MORRISON, London.

Law.

- (S. E. B.) Judge S. E. BALDWIN, Connecticut Supreme Court of Appeals; Professor, Yale University.

Philosophy of Religion.

- (E. G. B.) E. G. BROWNE, Lecturer, Cambridge University.
 (J. E. C.) Rev. J. ESTLIN CARPENTER, Manchester College, Oxford.
 (A. T. O.) Professor A. T. ORMOND, Princeton University.
 (R. M. W.) Professor R. M. WENLEY, Michigan University.

Education.

- (C. DE G.) Professor C. DE GARMO, Cornell University.

Aesthetics.

- (J. R. A.) Professor JAMES R. ANGELL, Chicago University.
 (J. H. T.) Professor J. H. TUFTS, Chicago University.

Neurology and Physiology.

- (H. H.)¹ { President C. L. HERRICK, University of New Mexico.
 { Professor C. J. HERRICK, Denison University.
 (C. F. H.) Professor C. F. HODGE, Clark University.

Bibliography.

- (B. R.) Dr. BENJ. RAND, Harvard University.

ADDITIONAL CONTRIBUTORS TO VOL. II.

- (L. C.) Professor LOUIS COUTURAT, University of Toulouse.
 (V. W.) Lady VICTORIA WELBY, London.
 (T. F. W.) Dr. T. F. WRIGHT, Boston.

¹ Joint authorship.

PREFATORY NOTE

WITH this volume the text of the Dictionary is completed. The Editor has nothing to add to the explanations given in the Preface to Vol. i; but it is his sad duty to record the death of two more of our collaborators. One of these, M. Léon Marillier of the Sorbonne, a member of the Board of Consulting Editors, gave time and labour generously to the determination of the French equivalents, and all those who use the Dictionary are indebted to him. His death is a severe blow, especially to the study of Comparative Religion, but also to that of Philosophy and Psychology. The other, Professor Adamson of Glasgow, contributed many articles on Logic, mainly to the first volume. His eminence in the department of Philosophy is well known to all readers of the work.

The Editor wishes to thank correspondents and reviewers for bringing to his notice various minor errors in Vol. i. The indulgent criticism so far made of the work encourages the editorial staff. Only on two points has the book been somewhat misjudged: we are not in any sense slighting Greek and Latin philosophy, and the remarks in the General Preface do not mean to suggest that we are. As it happens, much of the historical matter on classical thought is in the present volume. And, again, we are not in any way claiming that the treatment of biography is more than the proverbial 'part of a loaf'; it was a question, indeed, of part of a loaf or no bread. The bibliographies of Vol. iii will supplement the biographical notices, of course, very essentially.

The Dictionary is indebted for special articles to the new contributors mentioned at the end of the list of Collaborators given in this volume; and also to Professor Fabian Franklin of Baltimore, who gave his co-operation in the preparation of the article on 'Probability,' to which his initials (F.F.) are attached. On the other hand, the connection of Dr. Tosti with the work ceased with the issue of the first volume.

The Editor finds himself also under very great obligations to those who prepared the exhaustive Indexes; their names are given in connection with their respective lists.

THE EDITOR.

PRINCETON,
June, 1902.

LEADING OF PROOF — LEADING PRINCIPLE

Leading of Proof: no concise foreign equivalents. The operation bringing up to attention, among propositions admitted to be true, certain relations between them which logically compel the acceptance of a conclusion.

(C.S.P.)

Leading Principle: Ger. *leitendes Prinzip*; Fr. *principe directeur*; Ital. *principio fondamentale*. It is of the essence of reasoning that the reasoner should proceed, and should be conscious of proceeding, according to a general habit, or method, which he holds would either (according to the kind of reasoning) always lead to the truth, provided the premises were true; or, consistently adhered to, would eventually approximate indefinitely to the truth; or would be generally conducive to the ascertainment of truth, supposing there be any ascertainable truth. The effect of this habit or method could be stated in a proposition of which the antecedent should describe all possible premises upon which it could operate, while the consequent should describe how the conclusion to which it would lead would be determinately related to those premises. Such a proposition is called the 'leading principle' of the reasoning.

Two different reasoners might infer the same conclusion from the same premises; and yet their proceeding might be governed by habits which would be formulated in different, or even conflicting, leading principles. Only that man's reasoning would be good whose leading principle was true for all possible cases. It is not essential that the reasoner should have a distinct apprehension of the leading principle of the habit which governs his reasoning; it is sufficient that he should be conscious of proceeding according

to a general method, and that he should hold that that method is generally apt to lead to the truth. He may even conceive himself to be following one leading principle when, in reality, he is following another, and may consequently blunder in his conclusion. From the effective leading principle, together with the premises, the propriety of accepting the conclusion in such sense as it is accepted follows necessarily in every case. Suppose that the leading principle involves two propositions, L and L' , and suppose that there are three premises, P, P', P'' ; and let C signify the acceptance of the conclusion, as it is accepted, either as true, or as a legitimate approximation to the truth, or as an assumption conducive to the ascertainment of the truth. Then, from the five premises L, L', P, P', P'' , the inference to C would be necessary; but it would not be so from L, L', P, P'' alone, for, if it were, P would not really act as a premise at all. From P' and P'' as the sole premises, C would follow, if the leading principle consisted of L, L' , and P . Or from the four premises L', P, P', P'' , the same conclusion would follow if L alone were the leading principle. What, then, could be the leading principle of the inference of C from all five propositions L, L', P, P', P'' , taken as premises? It would be something already implied in those premises; and it might be almost any general proposition so implied. Leading principles are, therefore, of two classes; and any leading principle whose truth is implied in the premises of every inference which it governs is called a 'logical' (or, less appropriately, a *formal*) leading principle; while a leading principle whose truth is not implied in the premises

is called a 'factual' (or *material*) leading principle. (C.S.P.)

Least Squares (method of): see ERRORS OF OBSERVATION.

Left-handedness: see DEXTRALITY.

Legal [Lat. *legalis*]: Ger. *gesetzlich*; Fr. *légal*; Ital. *legale*. (1) Pertaining to law. (2) Conformable to law. (3) Pertaining to law, as distinguished from equity. (4) Defined or created by law, e. g. legal offences, legal disabilities.

Legal defence: one sufficient under the rules of law. *Legal ethics*: the ethical rules governing the conduct of the legal profession. That may be legal which is neither just nor honourable. 'Non omne quod licet honestum est,' *Dig.*, l. 17, *de diversis regulis iuris antiqui*, 144. (S.E.B.)

Legal Fiction: Ger. *Rechtsfiction*; Fr. *fiction légale*; Ital. *finzione legale*. The assumption, as a fact, of what is not known to be such, made by authority of law to promote justice.

It is generally done by the courts, sometimes by the legislature. Thus the English courts of common law, in order to take jurisdiction of matters of admiralty jurisdiction, anciently allowed a plaintiff to describe his cause of action as arising at Havre, to wit, in Westminster, and refused to allow the defendant to contest their right to entertain the case by denying the averment as to Westminster. Cf. Maine's *Ancient Law*, 26.

Legal fictions furnish the means by which most nations develop their system of procedure from formal into rational methods. See, as to their use in Roman law, Sohm's *Inst. of Roman Law*, § 38; Hadley's *Introd. to Roman Law*, 96. Wills causelessly disinheriting children could be set aside, 'hoc colore, quasi non sanæ mentis fuerint cum testamenta ordinarent. Sed hoc dicitur non quasi vere furiosus sit, sed recte quidem fecerit testamentum, non autem ex officio pietatis. Nam si vere furiosus sit, nullum testamentum est' (*Inst. of Just.*, ii. 18, *de inofficioso testamento*). (S.E.B.)

Legend [Lat. *legere*, to read]: Ger. *Legende*; Fr. *légende*; Ital. *legghenda*. An edifying tradition which has grown up spontaneously and uncritically around some historical personage, and which, though lacking in historic verity, is valuable in the revelation it makes of the spirit and life of the people and time that produced it.

In ecclesiastical history: legend is the story of a saint or other religious personage which has grown up gradually in response to

the requirements of religious edification, and which, though containing a nucleus of truth, is not historically reliable.

The legend differs from the myth in that it ordinarily develops about a real personage, whereas the myth may be pure fiction, and ordinarily arises out of a personification of some natural object or force. See MYTH.

Literature: EHRET, *Allg. Gesch. d. Literatur d. Mittelalters im Abendlande* (1874-87); MILMAN, *Hist. of Latin Christianity*; LECKY, *Hist. of Rationalism in Europe*. (A.T.O.)

Legislation [Lat. *lex*, law, + *latio*, a proposing]: Ger. *Gesetzgebung*; Fr. *législation*; Ital. *legislazione*. (1) The act of making a law, by a legislator or legislature. 'In legislation both the contents of the rule are devised, and legal force is given to it, by simultaneous acts of the sovereign power which produce "written law." All the other law sources produce what is called "unwritten law," to which the sovereign authority gives its whole legal force, but not its contents, which are derived from popular tendency, professional discussion, judicial ingenuity, or otherwise, as the case may be' (Holland, *Jurisprudence*, chap. v. 66). (2) The law made by a legislator or legislature.

Judicial legislation: the virtual making of law by judicial magistrates, by declaring in their judgments that to be law which had not previously been enacted or generally recognized as such. (S.E.B.)

Legitimate (in law) [Med. Lat. *legitimus*]: Ger. *gesetzmässig*, *legitim*; Fr. *légitime*; Ital. *legittimo*. Accordant with law; having the support of law; legally entitled, especially of a child born in lawful wedlock (whether begotten in wedlock or not).

Legitimate portion: that share of a parent's estate which, by the rules of the civil law, cannot be willed away from the natural heir without some recognized legal justification. (S.E.B.)

Legitimation [Fr.]: Ger. *Legitimation*; Fr. *légitimation*; Ital. *legittimazione*. That by which an illegitimate child is made legitimate in law.

By English and American common law there is no method of legitimation. The later Roman law allowed it by virtue of a marriage of the parents at any time after the conception or the birth of the child (*Inst. of Just.*, iii. 1, 2). Similar laws have been enacted in many of the United States.

By English common law, legitimation has no extra-territorial force. Cf. Wharton, *Private Int. Law*, chap. v. (S.E.B.)

Leibnitz (or Leibniz), Baron Gottfried Wilhelm von. (1646–1716.) Born at Leipzig, where his father was professor of ethics, he was educated at Leipzig and Jena Universities. He received a doctorate in law, but had become deeply read in scholasticism and logic. For a period he had also studied Bacon, Hobbes, Kepler, Galilei, Gassendi, and, to some extent, Descartes; and was for a time converted to the mathematico-mechanical conception of nature. Under the patronage of Baron Boineburg he prepared for a political life, became assistant to Lasser in the preparation of a reformed code of Roman law, and member of the Court of Appeals in Mainz (1670). He visited London, met Newton, Boyle, and others, and became Fellow of the Royal Society. In Paris he was intimate with Cassini and Huyghens. In 1676 he accepted a position in the court of the Duke of Brunswick-Lüneburg, and (1678) was made counsellor and member of the supreme court. Called to Berlin in 1698 by Princess Sophia Charlotte, he established the Scientific Society, which has since become Berlin University.

Lemma [Gr. *λήμμα*, gain, an assumption, premise]: Ger. *Hilfssatz*, *Lehnsatz*; Fr. *lemme*; Ital. *lemma*. A theorem which interrupts the course of development of a mathematical theory, but which is inserted to supply a premise for one of the theorems.

This use of the word seems to go back to Euclid, at least; and even Aristotle uses the word—not a common one with him—in connection with geometry, in the first chapter of the *Topics*. With Aristotle, however, it means a premise; and with the Stoics, more particularly, the major premise of a syllogism. (C.S.P.)

Lèse-majesty [Fr., also written 'leze-majesty': Ger. *Majestätsbeleidigung*, *Hochverrat*; Fr. *lèse-majesté*; Ital. *lesa maestà*. The crime of direct attack on the state, or on its sovereign, his family, or his chief officers of government.

Formerly in Europe this crime was also regarded as comprehending offences committed directly against God, such as sacrilege, blasphemy, or apostasy; being thus termed *lèse-majesté divine* (Merlin's *Répertoire de Jurisprudence*, sub verbo). Of *lèse-majesté humaine* there were several degrees, the offence being pushed so far in France as to include embezzlement by public officials and unlawful assemblies. The crime of HIGH TREASON (q.v.) was known by this name in England

in the time of Glanvil (12th century). The Roman law named this offence *maiestatis crimen*, or more fully 'crimen laesae, imminutae, diminutae, minutae, maiestatis,' *Dig.*, xlviii. 4, *ad Legem Iuliam Maiestatis*; Smith's *Dict. of Greek and Roman Antiq.* (*maiestas*); Heineccius, *Antiq. Rom. Syntagma*, iv. § 46 f. (S.E.B.)

Lessing, Gotthold Ephraim. (1729–81.) Educated at the Fürstenschule in Meissen, and at Leipzig, in philology and theology. After 1748 he spent some time as journalist in Berlin. Went to Wittenberg (1752) to complete his studies; returned to Berlin (1753) to resume his work as journalist and critic. After two years spent in Leipzig, he returned once more (1758) to Berlin. In 1760 he became secretary to General von Tauenzien in Breslau, during the Seven Years' War; 1767, official playwright and artistic director of the Hamburg theatre; 1770, librarian of the ducal library at Wolfenbüttel.

Lewes, George Henry. (1817–78.) An English Positivist, born in London. In youth a business clerk, he began the study of medicine, but abandoned it for philosophy and psychology. Spent two years in Germany, returning to London in 1840, and devoting himself to literature. He was literary editor of *The Leader* (1849–54), and founded the *Fortnightly Review*.

Liability (in law) [Fr. *lier*, from Lat. *legare*, to bind]: Ger. *Haftbarkeit*; Fr. *responsabilité*; Ital. *risponsabilità*. Such a relation by one to another as will or may support an action by the latter against the former.

The maker of a note, as soon as it is delivered, comes under a liability to the holder, which may support an action, and will, if the note be dishonoured when due. The *contingent liability* of the endorser of a note becomes an *absolute liability* when the note is dishonoured, and due demand and notice follow. Liability is viewed by Austin 'as a sanction' imposed by law as a penalty for disobedience of law. But an unintentional act of violence to another may impose an actionable liability, though there was no intent to disobey the law. Liability for an act whereby another is injured can be rested better on the natural obligation to act in contemplation of the natural tendency, under existing circumstances known or knowable, of the act to do harm (see Holmes on the *Common Law*, 79, 81, 162).

Limited liability: (1) a liability of shareholders in a business corporation or joint-stock

company, limited by law to the amount of their subscriptions for shares; (2) the restricted liability of shipowners for accidents occurring without their fault (see *U. S. Revised Statutes*, § 832). *Individual liability*: that which one holding a representative position as executor, cashier, or governor, may incur by contracting on his personal credit, though not for his personal benefit. The common-law maxim is *Ubi ius, ibi remedium*. (S.E.B.)

Libelt, Karol. (1807-75.) Educated at Berlin, under Hegel, in philosophy. Wrote the gold medal essay on Spinoza (1828); received his doctorate in philosophy (1830). Took part in the Polish revolution in that year, and was imprisoned nine months. In 1840 he opened a private school at Posen, and edited two journals. His life was given to literature. He was again imprisoned (1846-8), and his journal suppressed (1849). Took a prominent part in the reorganization of Great Poland, and protested in the Parliament at Frankfort against the incorporation of Great Poland in Germany. He was the first famous Polish philosopher.

Liberalism [Lat. *liber*, free]: Ger. *Liberalismus*; Fr. *libéralisme*; Ital. *liberalismo*. (1) The personal disposition to free and untrammelled thought and action.

(2) The social sentiment which welcomes reforming and progressive opinion and action.

Liberalism is opposed to conservatism in both these meanings; but a certain relative balance between them is necessary to stable social organization, in which the writer (*Social and Eth. Interpret.*, chap. v. § 3; cf. Royce, *Psychol. Rev.*, v. 1898, 113) has likened them to habit and accommodation in the individual's life. Extreme liberalism, taking the form of a disposition to accept innovations as such, is called radicalism.

Literature: see SOCIOLOGY, and SOCIAL PSYCHOLOGY. (J.M.B., F.H.G.)

Liberty (1) and (2) **Libertarianism** [Lat. *libertas*]: Ger. *Freiheit*; Fr. *liberté*; Ital. *libertà*. (1) See FREEDOM (various meanings), and WILL; (2) ETHICAL INDETERMINISM (q. v.), also the references made under (1). (J.M.B.)

Liberty (political): see FREEDOM (political and social).

Liberty (religious): Ger. *Religionsfreiheit*; Fr. *liberté religieuse*; Ital. *libertà religiosa*. The legally secured right of the individual to hold and practise without interference any form of religious belief and worship he may choose, in so far as the exercise of his prerogative does not conflict with the fundamental

political and social principles of the society to which he belongs.

The history of religious liberty in modern times begins with the edict of toleration by Constantine in 313 A.D. Throughout the middle ages the enforcement of conformity to prescribed forms of belief was regarded as a duty. The Reformation did not effect much advance in freedom, but Catholic and Protestant alike claimed the right of coercion. A considerable advance was made at the Peace of Westphalia in 1648, when equal rights were accorded to professors of the Catholic, Lutheran, and Calvinistic faiths. The French Revolution marked the beginning of a new era, in which the principle of religious freedom in its widest sense has gradually secured almost universal recognition.

Literature: GIBBON, *Decline and Fall of the Roman Empire*; GUIZOT, *Hist. of Civilization in Europe*; VOLTAIRE, *Essay on Toleration*; LOCKE, *Essays*; LECKY, *Hist. of Rationalism*; BANCROFT, *Hist. of the United States*. Cf. ERASTIANISM, and GALLICANISM. (R.M.W.)

Lie [AS. *leogan*]: Ger. *Lüge*; Fr. *mensonge*; Ital. *menzogna*. Any intentional deception of another by positive misrepresentation. Cf. EQUIVOCATION.

The essence of the lie rests in the intention to deceive; yet the means of the deception, by positive misrepresentation—as contrasted with either negative suggestion (*suggestio falsi*) or omission of truth (*suppressio veri*)—seems, though casuistical, to be well established. The following example from Macaulay (*Hist. of England*, chap. ix) illustrates this 'distinction without a difference.' Bishop Compton, who had invited William of Orange to invade England in 1688, is asked by King James if there is any truth in the statement in William's manifesto that some spiritual peers had invited him; he replies: 'Sir, I am quite confident that there is not one of my brethren who is not as guiltless as myself in this matter.' Macaulay remarks: 'The equivocation was ingenious; but whether the difference between the sin of such an equivocation and the sin of a lie be worth any expense of ingenuity may perhaps be doubted.'

The question of the ethical justification of a lie is also quite apart; whether right or not, a lie is a lie 'for a' that.' See VERACITY, and cf. CASUISTRY. (J.M.B.—H.S.)

Life and **Organic** [AS. *hlifian*, Gr. *ζῳον*]: Ger. *Leben*, *Lebewesen* (living being),

organisch; Fr. *vie, organique*; Ital. *vita, organico*. A form of organization found in certain material things, having the properties of self-perpetuation, for a longer or shorter time, and of reproduction in some form, and further distinguished by certain characters described as vital properties or properties of LIVING MATTER (q. v.). Matter having this organization and these characters is called 'living' or 'organic,' as opposed to 'dead' or 'inorganic' matter. Cf. also PROTOPLASM.

The theories of life have always turned on the form of organization displayed, as contrasted with other forms, such as notably the chemical. The problem seems little nearer solution now than in the time of the speculations of Aristotle. To Aristotle the soul was the 'form' or 'formal cause' of the organized body, the matter of which was the 'material cause' of the living creature. The scholastic theory of 'vitality' or 'vital force' postulated a principle additional to those of mechanical action and chemical organization, a view which laboured under the obscurity of the word 'force,' and came to be directly challenged when the generalization of the CONSERVATION OF ENERGY (q. v.) was announced. This difficulty, i. e. of determining whether vital phenomena are subject to the law of conservation, has never been overcome. The question is as to whether or not vital changes, such as those of development and growth, can be adequately accounted for as transformations of the known forms of energy; and if not, what more is necessary. Current views divide into (1) the mechanical or chemical, which holds that vital phenomena are entirely explainable in terms of mechanical and chemical change; (2) vitalism or neo-vitalism, holding to a 'something over,' which takes the form (a) of a new force or energy (e. g. growth-force or bathmism of Cope; 'genetic energy' of Williams), (b) a property of 'self-adaptation' (Henslow) or 'direction' (Eimer), or (c) the assumption of a form of 'so-called' directive force which, while diverting, guiding, or shunting physical energy, yet does not alter its amount. This last view often makes consciousness the new agent, and represents a distinct tendency in discussion to restate the question in terms of a dualism between matter and mind rather than between matter and life; the additional point being assumed, or directly advocated, that life and mind are coterminous. This does not alter the essential conditions of the problem, although it is held to strengthen the position of vitalism by

making accessible to it the facts and arguments in support of some sort of causal activity of mind. Philosophically, however, it has the distinct advantage of reducing two dualisms to one, and of bringing the question within the lines of one of the broadest and most critical problems, i. e. that stated by Aristotle in terms of 'matter and form,' discussed by religious philosophers under the heading of teleology, and taking the form in modern metaphysics of the inquiry as to the final category of organization (matter and motion, dualism of body and mind, or monism in some higher term). Cf. MIND AND BODY, ORGANIZATION, TELEOLOGY, and the remarks on teleology under HEREDITY. The discussion labours under the confusions hidden in the words CAUSE, FORCE, ENERGY (which should also be consulted). Cf. also ORIGIN OF LIFE.

As to the explanation of the facts involved, the rival theory to vitalism is natural selection, which is at its best in explaining the apparently vital directive movement in evolution, but weaker in explaining individual growth and development. On the other hand, vitalism makes its strongest stand in what is called the developmental mechanics of the individual, where the facts of REGENERATION (q. v.) and organic accommodation, it is held, can only be described in vitalistic terms and illustrate the inscrutable mystery of life (cf. Wilson, *The Cell*, 329). It is interesting to note, as illustrating the truth of this opposition, that the new vitalism is current for the most part in countries—notably Germany and the United States—where the problems of ontogeny are especially investigated, while in other countries—notably England—vitalism in any form is criticized as mysticism.

Literature: ARISTOTLE, zoological writings; WUNDT, *Logik*, II. i. 3, 4, 'd. Logik d. Biol.'; COPE, *Primary Factors of Organic Evolution*; VERWORN, *Gen. Physiol.* (Eng. trans.); WILLIAMS, *The Genetic Energy of Organisms*, *Science*, May 27, 1898; SANDEMAN, *The Problems of Biol.*; EIMER, *Organic Evolution* (Eng. trans.); WILSON, *The Cell*; OSBORN, *From the Greeks to Darwin*; BROOKS, *Foundations of Zool.*, v. BUNGE, *Lehrb. d. Physiol.* (1889); DU BOIS-REYMOND, *Ueber d. Grenzen d. Naturerkenntniss*; JAPP, *Pres. Add. Chem. Sec. Brit. Assoc.*, Report, 1898; LLOYD-MORGAN, *Monist*, Jan., 1899; WARD, *Naturalism and Agnosticism*; and most of the general works on the BIOLOGICAL SCIENCES (q. v.). (J.M.B., C.L.M.)

Life (spiritual) [ME. *lif*]: Ger. *geistiges Leben*; Fr. *la vie spirituelle*; Ital. *vita spirituale*. (1) That activity of a self-conscious being which gives rise to moral, aesthetic, and religious experiences.

(2) In theology: the divine life which is manifested in Christ, and in which the believer is by faith enabled to participate.

The spiritual life represents the central mystery of the Christian faith. The new birth involves the throwing away of the old carnal life and the putting on of a new life, of which the central principle is to be the spiritual energy of Jesus Christ. In the New Testament the spiritual life is not only represented as ideally rich and complete, but also as in its nature eternal as the life of God. (A.T.O.)

Light: see VISION.

Light of Nature [trans. of Lat. *lumen naturae* or *naturale*, a term used by Aquinas, *Summa Theologiae*, Pt. I, qu. 12, art. 13, and elsewhere. It is not necessary to suppose that he borrowed the term from the passage of Aristotle's *De Anima*, 430 a, 14, where the creative intellect is compared with light]: Ger. *natürliches Licht*; Fr. *lumière naturelle* (Pascal); Ital. *lume naturale* (Galileo). A natural power, or instinct, by which men are led to the truth about matters which concern them, in anticipation of experience or revelation. See LUMEN (also for literature).

The phrase is used in contradistinction to supernatural light. Tucker's *Light of Nature pursued* is a book written as a mild reaction against Locke and the Associationalists in the direction of the philosophy of common sense. (C.S.P.)

Light Sensation: Ger. *Lichtempfindung*; Fr. *sensation lumineuse*; Ital. *sensazione luminosa*. Visual sensation. See VISION. See also BRIGHTNESS. (E.B.T.)

Likeness or **Resemblance** (consciousness of) [AS. *lic*, in *gelic*, like]: Ger. *Aehnlichkeit*; Fr. *ressemblance*; Ital. *somiglianza*, or *rassomiglianza*. Two mental objects or contents are said to be alike for consciousness when in respect to certain features one might be taken for the other. This is hit off in the current conundrum: 'What is most like a rain-drop?' Answer: 'Another rain-drop.' Such objects are said to have likeness, to be alike, or to resemble each other.

Theories of likeness are based on partial identity of the two mental contents (cf. RESEMBLANCE); partial recognition of one in the other; partial assimilation of one to the other,

or of both to a third; or on an active adjustment to one which holds also in part for the two. The last of these views, to which the writers adhere, is well summed up by Ward: 'Presented objects become related as "like" either in virtue of the active adjustment to a change of impression which their partial assimilation defeats, or in virtue of an anticipated continuance of the impression which this assimilation confirms' (art. Psychology, in *Encyc. Brit.*, 9th ed., xx. 180). Cf. the classification given under RESEMBLANCE, and the topics there referred to.

The case in which two things are alike in all respects—are taken one for the other—is mentioned under INDISCERNIBLES, and DIFFERENCE. (J.M.B.—G.F.S.)

Limen [Lat.]: equivalent to THRESHOLD (q. v.), which is already current, and is preferred.

The adjectives 'liminal' (at the threshold), 'subliminal' (below the threshold), and 'supraliminal' (above the threshold) are useful. Cf. LIMITS OF STIMULATION. (J.M.B.)

Limitative [Lat. *limitare*, to enclose]: Ger. *limitativ* (*Urtheil*); Fr. *limitatif*; Ital. *limitativo*. (1) Applied to a third quality of judgments, additional to affirmative and negative. The idea of such a third quality originated among the Romans from the difference between 'homo non est bonus' and 'homo est non bonus,' the latter being the limitative.

(2) Setting limits in the sense (2) given under LIMITING NOTION (q. v.).

It is one of the numerous cases in which accidents of language have affected accepted logical forms without any good reason. Boethius and others applied the infinitation to the subject also, which De Morgan has shown makes a valuable addition to logic. Wolff, however, limited the modification to the predicate, without showing any serious reason for such application. Kant adopted it because it rounded out his triad of categories of quality. His defence, as reported by Jäsche, is that the negative excludes the subject from the sphere of the predicate, while the unendliche, limitative, or infinite judgment puts it into the infinite sphere outside the predicate. It is to be remarked that Kant regards a positive mark as differing *per se* from a negative one, and, in particular, as having a far narrower extension. Like most of the old logicians, he virtually limited the universe of marks to such as arrest our attention. If that had been explicitly and

consistently done, it would have constituted an interesting particular logic, in which there would be a material and not merely formal difference between affirmative and negative facts. It is probable that Kant also understood the affirmative proposition to assert the existence of its subject, while the negative did not do so; so that 'Some phoenixes do not rise from their ashes' would be true, and 'All phoenixes do rise from their ashes' would be false. The limitative judgment would agree with the affirmative in this respect. This was probably his meaning, and he did not observe that his limitative judgment, 'The human soul is immortal (nichtsterblich),' may be construed as equivalent to the conjunctive judgment, 'The human soul is not mortal, and it is the human soul.' No doubt Kant would have seen a world of difference between these two assertions. In that case he should have adopted a fourth quality, 'The human soul is not immortal.'

(C.S.P.)

Limiting Notion: Ger. *Grenzbegriff*; Fr. *notion-limite*; Ital. *concetto limite*. (1) A term used by Kant in a single passage of the *Krit. d. reinen Vernunft* (1st ed., 255) to signify that a NOUMENON (q.v., *ad fin.*), which is a thing in itself regarded as an object of reason, is something to which experience cannot attain, but is the inconceivable something behind the phenomena. The passage reads: 'Der Begriff eines Noumenon ist also bloss ein *Grenzbegriff*, um die Anmassung der Sinnlichkeit einzuschränken, und also nur von negativem Gebrauche.' (J.M.B.-C.S.P.)

(2) The notion of what would be the limiting or extreme case of the application of a truth or principle.

The limiting notion in this sense involves abstraction from the conditions of particular existence; and it also fulfils an ideal. Hence it is both limitative and negative with reference to existence in the sphere of the particular. Cf. LIMITATIVE (2), and LIMITS (in mathematics). The validity of Kant's negative conclusions regarding God, freedom, and immortality turns upon the construction of the negative character attributed to the limiting notion, i.e. upon the theory of reality of the noumenal or universal sort. (J.M.B.)

Limits (in mathematics) [Lat. *limes*, a boundary]: Ger. *Grenze*; Fr. *limite*; Ital. *limite*. A fixed quantity towards which we conceive or prove a variable quantity to approach, so that their difference becomes infinitesimal, though it never entirely disappears, is called a limit.

A simple example is that of the series $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \&c.$, in which each term is half the preceding one. It is evident that the sum of the terms will always be less than 1 by the last term, thus $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} = 1 - \frac{1}{8}$, &c. Now since, by halving a quantity continually, we can make it less than any assignable quantity, it is clear that there is no limit to the possible smallness of the difference between the sum and 1. On the other hand, the sum can never become equal to 1, because we shall always have a difference equal to the last term of the series. In this case the value 1 is said to be the limit of the sum of the series. (S.N.)

Limits (of Stimulation (1) and (2) of Sensation): Ger. *Grenzwerte*; Fr. *étendue*; Ital. *limine*. (1) The limits beyond which, in either direction, stimulation of a sense-organ is ineffective; (2) the boundaries of a sensation series or continuum. (E.B.T.)

In intensity: the extremes of intensity of stimulus that give sensations. The lower limit of sensation, the minimal sensation, the limen or THRESHOLD (q.v.), is the just noticeable intensity of sensation. The upper limit of sensation, or the maximal sensation, is that due to the most intense stimulus. The RANGE (q.v.) of sensation, according to Wundt, is measured by the maximal sensation divided by the threshold.

Wundt introduced the term Reizhöhe for the upper limit. The existence of the lower limit is in part due to the interference of physical and physiological stimuli, in part to physiological inertia and dispersion, and in part may perhaps be regarded as a case of subconscious stimulation. The upper limit is perhaps due to the injury of the sense-organ by intense stimulation. Cf. FECHNER'S LAW, WEBER'S LAW, and PSYCHOPHYSICAL METHODS. (J.M.C.C.)

In quality, &c.: the term 'limits of stimulation,' with its correlate 'range of stimulation,' applies also to sensation qualities. We may determine qualitative limits in two different ways. The upper and lower limit of tone stimulation, e.g., may be given as the greatest and least number of vibrations in the second that produce a tone sensation (see Auditory Sensation under HEARING). Or we may inquire as to the least number of vibrations necessary for the cognition of a tone of given vibration rate: this number seems to vary between 2 and 20. Moreover, every sense-organ shows limits with respect to the time intervals of stimulation, while the eye

and skin have also limits with respect to extent.

Literature: KÜLPE, *Outlines of Psychol.*, 34; WUNDT, *Physiol. Psychol.* (4th ed.), i. 334 f. (E.B.T.)

Lindner, Otto. (1820-67.) Born and educated at Breslau, he devoted himself especially to philology and philosophy. He became a private instructor in Berlin, and in 1847 took a position on the *Vossische Zeitung*, becoming editor-in-chief in 1863.

Line of Beauty: Ger. *Schönheitslinie*; Fr. *ligne de beauté*; Ital. *linea di bellezza*. A term applied by Hogarth (1745) to a serpentine line, which he regarded as the most beautiful outline.

In his *Analysis of Beauty* (1753) Hogarth styled the serpentine line 'line of grace' (see GRACE), and restricted the term 'line of beauty' to the waving line (—). He regarded 'variety' as the ground of its aesthetic value. (J.H.T.)

Line of Direction: Ger. *Richtungslinie* (-strahl); Fr. *ligne de direction*; Ital. *linea di direzione*. The line of direction is the straight line connecting a luminous point with the nodal point of the 'reduced' eye, and prolonged to meet the retina. It gives the position on the retina of the luminous point. See Fig. 7 under VISION.

Literature: HELMHOLTZ, *Physiol. Optik* (2nd ed.), 91, 742; WUNDT, *Physiol. Psychol.* (4th ed.), ii. 98; SANFORD, *Course in Exper. Psychol.*, expts. 106, 117; AUBERT, *Physiol. Optik*, 600; FICK, in Hermann's *Handb. d. Physiol.*, III. i. 64; HERING, *ibid.*, 349; *Beitr. z. Physiol.*, i. (1861) 25 ff. Cf. LINE OF VISION. (E.B.T.)

Line of Regard: Ger. *Blicklinie*; Fr. *ligne de regard* (Helmholtz, *Physiol. Optik*, Fr. trans., 599); Ital. *linea di mira*. The straight line connecting the point of regard or fixation point with the centre of rotation of the eye. See Fig. 7 under VISION.

Literature: HELMHOLTZ, *Physiol. Optik* (2nd ed.), 91, 617, 679; SANFORD, *Course in Exper. Psychol.*, 119, and expts. 176, 177, 219; WUNDT, *Physiol. Psychol.* (4th ed.), ii. 99, 121; AUBERT, *Physiol. Optik*, 419, 646; HERING, in Hermann's *Handb. d. Physiol.*, III. i. 441. See LINE OF VISION. (E.B.T.)

Line of Vision or Line of Sight: Ger. *Gesichtslinie*; Fr. *rayon visuel*; Ital. *linea visuale*. A straight line joining the fovea with the fixation point, and making with the OPTICAL AXIS (q. v.) an angle of about five degrees. The line may also be defined in

terms of the nodal point of the 'reduced' eye, and accordingly termed the 'principal ray of direction.' It is practically coincident with the LINE OF REGARD (q. v.; see also Fig. 7 under VISION).

Literature: WALLER, *Human Physiol.*, 412; HELMHOLTZ, *Physiol. Optik* (2nd ed.), 91, 617; WUNDT, *Physiol. Psychol.* (4th ed.), ii. 99, 121; AUBERT, *Physiol. Optik*, 415, 417; FICK, in Hermann's *Handb. d. Physiol.*, III. i. 59; HERING, *ibid.*, 349. (E.B.T.)

Linguistic Science: see PHILOLOGY, LANGUAGE, and PHONETICS.

Listing's Law: Ger. *Listing'sches Gesetz der Augenbewegungen*; Fr. *loi de Listing pour les mouvements de l'œil*; Ital. *legge di Listing*. 'If the LINE OF REGARD (q. v.) is carried from the primary to any other position, the torsion of the eyeball in this new position is as it would be if the eye had turned about a fixed axis, standing at right angles to both directions of the line of regard' (Helmholtz).

The law has two corollaries: (1) that in movements from the primary position there will not be, and (2) that in movements from secondary position to secondary position there will be, rotation about the line of regard. Cf. Sanford, *Course in Exper. Psychol.*, expt. 131 b, and App. I.

Literature: HELMHOLTZ, *Physiol. Optik* (2nd ed.), 623; WUNDT, *Physiol. Psychol.* (4th ed.), ii. 116; SANFORD, *Course in Exper. Psychol.*, expt. 131 b; AUBERT, *Physiol. Optik*, 646, 653; LE CONTE, *Sight*, 147; HERING, *Binocul. Sehen* (1868), 64, 68; RUETE, *Lehrb. d. Ophthal.*, i. 37. (E.B.T.)

Litré, Maximilien Paul Emile. (1801-81.) Born and educated for medicine in Paris. In 1830 he fought on the barricades in Paris as a republican. Shortly after this he began writing scientific articles for *Le National*. In 1839 he became a member of the Académie des Inscriptions et Belles-Lettres. In 1840 he read the works of Auguste Comte and became a leader among the advocates of the Positive philosophy. He took up the *Histoire littéraire de la France* upon the death of Fauriel in 1844. In 1863 he presented the Academy with the first part of his *Dictionnaire de la Langue Française*; he continued also his contributions to medical literature. Member of the Assembly in 1871, and life senator after 1875. Member of the Académie Française after 1874.

Living Matter: Ger. *lebendiger Stoff*; Fr. *substance vivante*; Ital. *sostanza* (or *materia*) *vivente*. Matter in the peculiar un-

stable or labile condition which enables it to manifest the properties or functions of life. These properties are (1) nutrition in its widest sense, as including all the processes of anabolism and katabolism. (2) Reproduction: the power of changing dead (food) matter into itself, thus reproducing itself and increasing in amount up to the limit of the food supply. All known living matter has thus arisen from previous living matter. (3) Irritability, including the fundamental functions of conductivity and contractility: the property of living matter by which it is enabled to respond to stimuli, i.e. to maintain continuously internal adjustments to external changes, an essential characteristic of life. (C.F.H.)

Chemical Composition. Protoplasm is not a unitary chemical substance, but it is a complex mixture in ever-varying proportions of very many different substances. The quest for a definite chemical formula for protoplasm has proved vain. Living substance can at present be defined, not in terms of chemical composition, but in terms of its morphological and physiological properties. The nature of the bond which holds these diverse substances together and maintains the integrity and continuity of the life process during the continual flux of the elements of its physical basis, which, in short, renders living substance self-perpetuating—this is the problem of life, and it is apparently as far from solution to-day as it was in the time of our fathers, who cloaked their ignorance under the term 'vitalism.' Cf. LIFE.

Vital manifestations, however, so far as they have yet been analysed, reduce themselves to physico-chemical forces, from which it may be inferred that the distinguishing features of living things depend upon the nature of the interrelation of these forces rather than upon any special super-physical force. But it does not at all follow that the synthesis of living substance would be possible, even if we were able to make artificially all the proximate chemical compounds which are mingled in its structure. For, as Oscar Hertwig has pointed out, none of the protoplasm now living has been formed in any other way than by the propagation of pre-existing protoplasm; it is, therefore, the product of an exceedingly long historical development.

At present, however, our knowledge of the molecular structure of the proximate ingredients of protoplasm is very meagre. The simplest of these organic compounds have very large molecules, often with more than a

thousand atoms. The formula for a molecule of albumen has been given as $C_{72}H_{106}N_{18}SO_{42}$, and for haemoglobin, $C_{600}H_{950}N_{154}Fe_2S_2O_{179}$. This peculiarity alone is sufficient to explain many of the properties of organic substances, such as their inability in most cases to dialyze and to diffuse rapidly in solutions. For some interesting speculations growing out of the properties of the twelve elements chiefly represented in organized bodies (viz. C, N, S, H, O, P, Cl, K, Na, Mg, Ca, Fe), see Spencer's *Principles of Biology* and Verworn's *General Physiology*. The latter author gives a brief account of Pflüger's interesting researches on the rôle of cyanogen, CN, in the metabolism of proteids, from which the conclusion is drawn that the essential difference between living and dead proteid is the presence of the radical cyanogen in the former, but not in the latter. Further study of the properties of some of the non-living compounds of this radical brings out some curious resemblances with living proteid (notably in their tendency towards transformation and polymerization), and Pflüger concludes: 'Accordingly, I should say that the first proteid to arise was living matter, endowed in all its radicals with the property of vigorously attracting similar constituents, adding them chemically to its molecule, and thus growing *ad infinitum*. According to this idea, living proteid does not need to have a constant molecular weight; it is a huge molecule, undergoing constant, never-ending formation and constant decomposition, and probably behaves towards the usual chemical molecules as the sun behaves towards small meteors.'

Another, and perhaps the simplest, method of considering the problem of living matter, though it suffers, as do all others, from the impossibility of concrete demonstration, concerns itself not with the analysis of the material elements of living substance into units whose quantitative formulas somehow are supposed to represent the potency of the substance, but with a synthesis of the several energies after the analogy of the composition of forces in mechanics. This theory does not suppose that the several grades of vitalized matter differ in ways that can be expressed by chemical formulas, but the forces merged into the living entity are conceived of as constituting a unitary force compounded from the more elementary ones, merged in it in such a way that, if our knowledge were complete enough, the several vital activities might be

expressed somewhat as are the complex curves of geometry. The essential point of this theory lies in its insistence that the vital activity is a unit and not a compound thing. A method of dynamic notation is greatly needed in this connection.

Microscopic Structure. Casual examination of protoplasm, even with rather low magnifying powers, shows that it is by no means homogeneous; and the more thorough the examination, the more forcibly is this differentiation impressed upon the observer. When properly prepared by suitable reagents it is seen to be composed of a more fluid portion or plasma (cytolymph, enchylema, or ground-substance), and a more dense material, the spongioplasm. The latter must not, however, be regarded as normally a solid, for living substance as a whole is unquestionably liquid.

The theories of protoplasmic structure fall into two general classes: those which regard the more fluid plasma as the essential vital part, and those which regard the more dense framework as the essential, the interstitial substance serving simply as a vehicle for nutrition, &c. Though the former of these views is supported by several eminent authorities, yet the great majority of observers hold to the latter conception in some form, or regard both ingredients as equally essential. But these observers are by no means agreed as to the nature of the spongioplasm. We have, accordingly, from this point of view, four theories of protoplasmic structure:—

I. The granular theory. The microscope does unquestionably reveal the presence of numerous granules both in living and in prepared protoplasm, and they have given rise to much speculation. They have been variously termed micellae, pangens, ideoblasts, ideosomes, plastidules, bioplasts, gemmae, biogens, biosomes, microsomes, &c. The latter term is perhaps the most unobjectionable, as involving less of hypothetical interpretation. Many authors regard these bodies as a sort of biological unit of lower order than the cell. The existence of such units was postulated from theoretical grounds by several of the earlier authors (Spencer's 'physiological units,' Nägeli's 'micellae,' Darwin's 'gemmae,' &c.), and they figure very largely in the writings of several recent authors (notably Weismann and Altmann).

II. The filar theory. According to this conception, usually ascribed to Flemming, the spongioplasm is composed of interlacing

threads which do not unite to form a reticulum.

III. The reticular theory. The structure is conceived of as a mass of threads which are combined into a more or less regular network. This reticular appearance is very often observed, though it is not always possible to prove that the fibres actually anastomose. The microsomes are often seen in connection with it, either at the nodes of the reticulum or strung along the fibres. Probably the majority of competent observers, at least until very recently, have held to this view.

IV. The alveolar theory. This we owe primarily to Bütschli, whose researches upon artificial foams lend some support to the belief that protoplasm is a microscopic foam or emulsion of two liquids of different densities. The fibres of the other theories are the walls of the vesicles of this emulsion as seen in optical section. This idea is being adopted, wholly or partially, by a rapidly increasing number of both zoologists and botanists, particularly those of the younger generation.

Probably no one of these conceptions expresses the whole truth. Indeed, Wilson has very recently brought forth strong direct evidence that the alveolar spheres, microsomes, and some, at least, of the true thread structures of the cytoplasm, are all different gradations of one structure. He agrees with Kölliker that 'no universal or even general formula for protoplasmic structure can be given,' and adds: 'Life in its full sense is the property of the cell-system as a whole rather than of any one of its separate elements. Nevertheless, we are perhaps justified in maintaining that the continuous substance is the most constant and active element, and that which forms the fundamental basis of the system, transforming itself into granules, drops, fibrillae, or networks in accordance with varying physiological needs.'

Properties. Since the dawn of science, there has been a strong tendency towards mysticism in the treatment of all phenomena connected with life. Of the commonly enumerated fundamental physiological properties (spontaneity, irritability, contractility, growth, reproduction, &c.), all, except possibly the last, when rigidly defined, can be shown to be manifested in some degree under proper conditions by dead substances. The specific living substance contains no elements not found in unorganized matter, though, as we have seen, these elements are probably arranged in a characteristic manner. If we follow

Verworn and say that 'the life-process consists in the metabolism of proteids,' it is plain that there is no room here for any meta-physical agency, since metabolism is merely the sum of the chemical processes going on within the body.

The present tendency is to study the properties of living beings in the same way as we do the properties of other physical bodies, viz. experimentally. This, of course, has always been the method of physiology, but of late it has been widely extended into the fields of experimental morphology and experimental embryology, in the hope of determining, not only what the phenomena of these sciences are, but how they came to be so. Since all vital manifestations can probably be reduced to responses of the living material to the forces impinging upon it from the environment, this study resolves itself into two problems, viz. the intrinsic properties of the reacting substance as such, and the specific effects of outer forces upon this substance.

The former problem includes the study of the protoplasmic constants, such as general chemical properties, physical structure, heredity, &c., and is far less advanced than the latter. Since in nature these two factors are always represented in every vital phenomenon, for scientific purposes they must be artificially separated, either by logical analysis or actually, under experimental conditions. Hence the motive for the present tendency towards experimental biology. It must be admitted that this analysis has not yet been carried very far. Even HEREDITY (q. v.), the name given to the self-perpetuation of vital processes from generation to generation, is not rigidly true to type, i. e. variations occur, whose connection with external conditions cannot always be traced, and the embryologists are divided into opposing schools on the question of the relative importance to the course of the ontogeny of intrinsic, i. e. inherited, factors and those which are extrinsic, i. e. determined by the direct action of the environment. This is the modern phase of the old controversy between PREFORMATION and EPIGENESIS (see those terms, and cf. Wilson, *The Cell in Development and Inheritance*, particularly the last chapter).

All the phenomena of growth, however much they may be dependent upon inherent structure, are also affected variously by environmental influences. For instance, the necessity for the division of a growing body

into units (cells) of small size is due simply to the fact that during growth the absorbing surface, by which alone nutriment can enter the protoplasm, increases as the square of the radius, while the protoplasmic mass, in which the consumption of nutriment takes place, increases as the cube of the radius. Obviously a limit is soon reached beyond which nutriment cannot be absorbed as fast as it is consumed, and either growth must cease or the mass must be divided so as to permit an increase of surface without a corresponding increase of mass. One of the most striking cases of the influence of external forces upon the course of development has been recently brought out by Loeb, who finds that unfertilized eggs of sea-urchins, if put into water containing a definite proportion of magnesium chloride for a short time and then transferred to ordinary sea water, will develop into normal larvae without previous fertilization. See PARTHENOGENESIS (artificial).

Again, observation shows that different organisms are adapted to very diverse environmental conditions, so that what is favourable to one may be fatal to another. This presumably rests upon a difference in the structural organization of the protoplasm. But experiment teaches us that an animal or plant may, by gradually changing the external conditions of life, be acclimated or accommodated to an environment which would have been fatal to it before. This change in the conditions of life may be brought about in a race by natural selection, or it may be produced in an individual by the direct influence of the environment upon the living matter. Davenport explains the latter case by the assumption of a specific kind of molecule in the protoplasm which is capable of responding to a certain stimulus. The repeated application of this stimulus might destroy these molecules faster than they could be replaced, and in consequence the organism would in the end be unable to respond to this particular stimulus. If the stimulus is an injurious one, the organism would no longer be injured by it. This hypothesis would explain, not only acclimatization, but also immunity after inoculations, &c.

Many attempts have been made to localize the various vital processes within the cell. Thus, the chromatin of the nucleus is regarded by many as the specific bearer of heredity. It is, however, impossible wholly to exclude the participation of the cytoplasm in the process of fertilization. The nucleus, more-

over, is sometimes spoken of as the source of the chemical energy of the cell, though it is more correctly described as the centre of the metabolic activities of the cell. The nucleus is sometimes seen to migrate in a large cell to the point of most active growth, and in other cases is enlarged and curiously modified in correlation with special metabolic functions of its cell. It is well known that non-nucleated bits of protoplasm, while they may ingest and partially digest food, are incapable of assimilating it, and hence soon perish. On the other hand, experiments show that the nucleus is also incapable of prolonged life without the cytoplasm. It has also been shown that, though nucleated bits of protoplasm are in many different organisms capable of regenerating the whole body, nevertheless there is a limit of size (which differs in different animals) below which such regeneration cannot occur, on account of deficient organization, even though all the other conditions seem to be fulfilled. Thus, Lillie found that a nucleated fragment of the protozoan *Stentor* could regenerate the whole body, provided it contained at least one twenty-seventh of the mass of the normal *Stentor*, but not if smaller than this.

The reactions of organisms to external stimuli are reduced in last analysis to reactions of their individual cells; they can therefore best be studied in the unicellular animals and plants, since here each cell can express its proper reaction by free movement. Accordingly, we have an extensive series of researches upon the reactions of such cells to external stimuli, giving us the following types of simple responsive movements: (1) chemotaxis, response to chemical stimuli; (2) phototaxis (heliotropism), response to luminous stimuli; (3) thermotaxis, response to thermal stimuli; (4) hydrotaxis, movements towards or from moisture; (5) barotaxis, movements determined by pressure, and including (a) thigmotaxis (stereotaxis), movements towards or from a solid object; (b) rheotaxis, movements with reference to the direction of flow of a current of liquid; (c) geotaxis, movements with reference to the direction of gravity; (6) tonotaxis, movements with reference to the density of the medium; (7) galvanotaxis (electrotaxis), movements with reference to electrical stimuli.

It is to be noted that these simple reactions, which are common to animals and plants, include nearly all (and perhaps quite all) the elements of the simpler reflexes of

higher animals. These reflexes, therefore, as Loeb has so forcibly argued, are not to be regarded as functions of nerve cells only, but rather of protoplasm as such.

The preceding reactions may all be described as 'directive effects of unilateral stimulation' (Verworn). Of course, they are not confined to unicellular organisms, for free cells within the bodies of higher animals (leucocytes, sperm cells, &c.) undoubtedly obey these laws; so also many of the movements of the bodies and organs of these animals, such as the various tropisms recognized in physiology. Even when free movement of the reacting cells is prevented by the adjacent tissues, the forces underlying chemotaxis, &c., undoubtedly govern intra-cellular life to a large extent. This is best illustrated by the selection of food. Thus, each of the various types of cells of the body, all of which are bathed in a common nutrient fluid—the body lymph—selects the materials of which it has need, and no others.

The ultimate explanation of all these reactions is, naturally, to be sought in internal organization. The importance of the latter factor is also shown by the fact that the same reaction often follows from very diverse stimuli. For instance, muscular contraction can be evoked by chemical, mechanical, thermal, or electrical stimulation. In other words, the organization of contractile substance is such that if its vital equilibrium is disturbed by any cause whatever, its energy is discharged in a single mode. It follows that any living tissue which has any considerable structural differentiation possesses a certain SPECIFIC ENERGY (q. v.), though just how far the 'specific energy' of any given organ (notably among the sense organs, where the term was first applied) is due to internal cellular organization of the primary reacting cells, and how far to differences in the connections of these cells with other cells, is still an open question.

Local Sign: Ger. *Lokalzeichen*; Fr. *signes locaux*; Ital. *segni locali*. A specific 'shading' or 'colouring' of certain sensations whereby every such sensation is invariably referred to a definite position upon the organ or elsewhere in space.

The local signs of pressure may be regarded either as intensive differences of thickness in the epidermis, differences in tightness of the stretching of the skin over underlying parts, &c. (Lotze), or as qualitative (Wundt). The local signs of vision may be simple sensations set up by reflex movements of ocular rotation (Lotze, Helmholtz), similarity and difference of neighbouring and remote impressions (Lipps), or complexes of 'movement' sensations and retinal qualities (see INDIRECT VISION), such as gradations in colour tone (Wundt, Baldwin). Some sort of local sign is a necessity for theories of space-perception of the class designated genetic nativism in the article EXTENSION (q. v.). In some cases localization can be shown, by experiment, to imply the existence of a disparate local sign: so tactual

localization by association with vision. This fact is, so far, an argument for the existence, in other cases, of a local sign in kind. See SPACE (perception of), and EXTENSION. (E.B.T.)

This sort of localization should be distinguished from the perception of space or of extension. See SPACIALIZATION. Specific LOCALIZATION IN SPACE (q. v., 1) may require a local sign independently of or in addition to the data of the perception of extension, as appears negatively in the vague LOCALIZATION OF SOUNDS (q. v., also LOCALIZATION IN SPACE, 2). (J.M.B.)

Localization (cerebral) [Lat. *locus*, place]: Ger. *corticale Localisation*; Fr. *localisations cérébrales* (generally plural); Ital. *localizzazioni funzionali del cervello*. (1) The doctrine that various parts of the brain have relatively distinct functions.

(2) The theory that certain psychical and physiological functions are limited to definite areas or regions of the brain (especially the distribution of conscious activities, such as visual, auditory, and other sensations, as well as voluntary movement of various groups of muscles, to sharply limited areas of cortex).

The theory in its broadest form is thoroughly substantiated by anatomical, pathological, and experimental data.

Two distinct tendencies are represented by the schools headed by Ferrier and Munk on the one hand, and Goltz on the other; the one school claiming that well-defined areas may be recognized, whose functions are limited to reactions upon a single set of muscles or a single class of sensory disturbances, or both; the other laying great emphasis on the unity of the brain, and the fact that injury to any region affects the whole cortex, altering the psychical tone as a whole. Munk claims that such motor disturbances as occur after injury, e.g. to the parietal cortex, depend upon an impairment

LOCALIZATION

of the sensations necessary to the release of such movements.

Probably the two views are not necessarily antagonistic when properly interpreted. It may be granted that certain areas of cortex actually stand primarily related to certain groups of muscles (or their myelonic centres), and certain other areas receive the stimuli elaborated in the primary projection centre for one organ of special sense; but it may still be true that every mental presentation is a result of a process of equilibration in the entire organ, and thus that a localized injury will express itself in alterations of mental tone rather than a simple abolition of a single kind of mental expression or a specific modification of consciousness.

The undoubted fact of substitutional functioning is not difficult to understand in view of the great complexity of the cortex, and especially of the far-reaching intercommunication of its different regions.

The precise and minute delimitation of the motor and sensory areas is of great practical importance as an aid in diagnosis and operation in intra-cranial injuries; but it has much less significance for the proper construction of mental processes than has sometimes been supposed.

Our most reliable data are derived from experimental study of lower animals and records of autopsies in cases of brain trauma. Naturally the results of complete extirpation of the hemispheres have not been observed in man. In a few instances such an operation has succeeded in dogs, with results such as the following: strong irritation of the skin caused the animal to growl and bite, loud noises awakened him from sleep, taste of food excited impulse to eat, and he reacted to some extent to visual stimuli. On the other hand, originative power was destroyed and all trace of recognition and memory was obliterated. In other words, although complicated cyclical reflexes exist, there is no evidence of psychic functions of the higher orders. All voluntary motion is, of course, impossible.

The researches of Munk have proved the very minute delimitation of the motor areas for the limbs and body regions, and also for the special senses. The centrifugal paths from the various parts of the cortical field for vision are said to be arranged to correspond quite minutely with the parts representing the various parts of the retina, so that visual stimuli give rise to co-ordinated

oculo-motor reflexes appropriate to direct the axes of vision towards the segment of the retina stimulated, and experimental irritation of these cortical regions calls out the same reflexes—the subject not being under the influence of an anaesthetic.

Removal of a single cortical motor centre, or the cortical centres for both limbs on one side, results in the permanent prevention of all independent voluntary motions of the corresponding muscles, but such motions as are performed in common with other organs, especially those of the corresponding muscles of the other side, may still be performed. So walking, swimming, and co-ordinated motions may coexist with a true cortical hemiplegia, thus showing that the volitional stimulus for correlated motions passes via a secondary apparatus below the cortex. The arrangement explains the possibility of an acquired quasi-reflex mechanism. The areas for general sensation correspond in general to

Fig. 1 (reduced from Naunyn). The three cortical fields for aphasia. Areas the injury of which may produce disturbances of speech. A. Broca's region, or that controlling the motor activities of speech, injury to which produces motor or atactic aphasia. B. Wernicke's area (hindmost two-thirds of first temporal convolution). Injury of this area of cortex produces auditory aphasia. C. Visual speech area, injury to which produces word-blindness and visual aphasia.

the cortical motor areas for the same regions, though the two are not mutually inclusive. The reported loss of sensation due to operative injury of the hippocampal region and limbic lobe is probably due to simultaneous injury of corona fibres which here lie near the surface.

While removal of the cortical areas for the extremities destroys permanently the tactile sensations for the corresponding members, the general sensitiveness remains, as also the response to painful irritation. The localized tactile sense is abolished, while

LOCALIZATION

general sensation and pain are simply modified or diminished.

The explanation of the facts of localization is attended with difficulties, but it is rendered simpler by recent histological researches (see BRAIN, and NERVOUS SYSTEM). Munk refers the loss of motor and sensory power resulting from extirpation of the cortical areas to the prevention of the formation of the motor and sensory presentations. A dog whose visual sphere is removed may then be said to suffer psychical blindness, and it would be but a step to add that the motor inco-ordination resulting from injuries to the centres for the extremities is a psychical paralysis (cf. PSYCHIC DUMBNESS). The minute delimitation of the areas for each segment of a sensory field is rendered impossible by the overlapping and intercommunication between them, but there is no reason to doubt the existence of such extensive representation on the cortex. The most recent experiments all confirm the idea that the entire cortical representative apparatus reacts as a single mechanism, so that every 'state of consciousness' is in a sense the product of the equilibration of the totality of cortical activities. The preponderance of activity in one sensory sphere affects this *rapport*, in a way constituting a conscious excitation of that sense. It follows that any injury to one part of the cortex not only abolishes the vestiges of previous excitations of that sense, but enfeebles the entire intelligence, by cutting out a variety of associational vestiges, both of the lost sense excitations and of presentations in which they formed an essential part, though originating in other spheres.

Details of localization may be gathered from the figures.

Historical. That the brain is in some way associated with thought was recognized very early, and this view prevailed among the

Greek physicians, in spite of the fact that Aristotle described the brain as the most bloodless and inert organ of the body, designed simply to regulate the heat of the

Fig. 2. Diagram of the course of optic fibres to the occipital cortex in the dog. (After Munk.)

latter, much as the condensing vapours of the sky mitigate summer heat and drought. Pythagoras, Hippocrates, and Plato clearly recognized the head as the seat of the intellect and will, while in the days of Ptolemy Soter some attempt was made to localize functions. Erasistratus believed that the sensory nerves

LOCALIZATION

spring from the meninges, while the motor are derived from the substance of the brain itself (a view intelligible when we take into account the close attachment of the sensory ganglia to the meninges). Hierophilus is said to have anticipated Descartes in the belief that the vital forces reside in the ventricles, a view to which the followers of Galen also subscribed. The Arabian physicians and their successors extended the doctrine of localization. Albertus Magnus assigned judgment to the frontal regions, imagination to the parietal, and memory to the occipital. The notion of animal spirits within the ventricles survived to some extent till the 18th century.

where the agitation is communicated to the central mass of vital fluids therein. The currents thus produced may, under suitable conditions, pass out through the motor nerves to muscles, producing what are now called reflexes. The soul itself is lodged in the 'pineal body,' which was selected from among the organs of the body because of its central azygous position and its close connection with the ventricles. The soul is usually affected by the currents setting from the body, and fabricates its presentations from the impression thus derived, but it also impresses its own acts upon the vital fluids, giving rise to motor currents. Aimless eddies may produce

Fig. 3. Zones and centres of the lateral aspect of the human cerebrum. (After Mills.)

Malpighi was the first to ascribe the higher functions to the grey matter.

Descartes was the first to elaborate a consistent theory of brain functioning. Influenced by Harvey's discovery of the mechanics of circulation, he taught that the friction involved in circulation sufficed to vaporize and excite various elements of the blood. Some of these elements pass to the reproductive organs, and behave as the forerunners of Darwin's gemmules might be expected to do, while others, destined to the brain, there evolve the gaseous animal spirits on which nervous action depends. All nerves are tubes containing these spirits. In the sensory nerves the currents set towards the brain,

phantasy, and there is a separate mental activity to correspond to each form of disturbance in the vital humours.

Descartes' speculations prepared the way for a variety of localization theories. Willis located memory in the convolutions, imagination in the callosum, sense-perception in the striatum, visual perception in the thalamus, and involuntary motion in the cerebellum. Meyer, on the other hand, regarded the cerebellum as the organ of abstraction, and located memory in the roots of the cranial nerves. Thus the way was prepared for Gall and Spurzheim. Gall's theory rested on the assumption that the skull depends for its form upon the growing brain, that there-

fore its surface reflects the state of development of the brain, and that size and configuration alone determine mental power. To these may be added sundry crude psychological postulates. Though phrenology is primarily a system of psychology, its popularity depended on the purely empirical form in which it was clothed, while what really gave it its power with the masses was the fact that it served to give a scientific character to certain theories which survived astrology under the name of physiognomy or cheiromancy.

The researches of Broca, by which he was enabled, in 1861, to locate a cortical centre for articulate speech, mark the real beginning of the modern doctrine of cortical localization. For a time all disturbances of speech were referred to this area. Our present knowledge permits us to state that lesions of the posterior portion, or *pars opercularis*, of the third frontal gyrus (commonly known as Broca's convolution, marked 'speech' on Fig. 3) produce motor aphasia, called 'Broca's type,' but many hold that it is amnesic aphasia, the pure motor aphasia arising from a subcortical lesion. The accidental discovery by Fritsch and Hitzig, during the Franco-Prussian War, that the galvanic current applied to the cortex is capable of exciting the motor mechanism, opened the way for experimental researches, and from this time onward the pathological method and the experimental have co-operated in the cultivation of this field. For details of localization in the case of speech, see SPEECH AND ITS DEFECTS.

Localization (in space). Localization in space is the reference of a sense impression or of an object to a local position.

The two general questions which should be distinguished are those (1) of the distribution of localities on the area of the skin and retina (see LOCAL SIGN), together with the nervous PROJECTION (q. v.) of sensations as such to the surface of the body; and (2) the locating of

objects in the external world. See SPACIALIZATION.

The earliest theory of space localization in the sense of (1) is what Hamilton calls 'the common dogma of the schools, that the soul is all in the whole body, and all in every one of its parts' (Reid's *Works*, Suppl. Diss., 861, note). Then follows the doctrine of Descartes, that the soul immediately perceives the images in the corporeal phantasy, viz. the brain. The modern treatment of the subject may be said to start with Herbart in Germany and with Bain in England.

Literature: for the Herbartian view see VOLKMANN, *Lehrb. d. Psychol.*, ii. 117-26; and for Bain's view see BAIN, *The Senses and the Intellect*, 415 ff. Cf. the textbooks of psychology. See also EXTENSION, and SPACE (perception of). (G.F.S.-J.M.B.)

Localization (in time). The reference by the subject of an event in his own history to its position in the time series relatively to the present moment and to other events, past and future. See TIME.

The question of the conditions of time localization is comparatively modern. Its detailed treatment begins with the Herbartian psychology in Germany. For something of the theory see TEMPORAL SIGN.

Literature: VOLKMANN, *Lehrb. d. Psychol.*, ii. 11-20. There is little written on the subject by the classical English psychologists; see, however, JAMES MILL, *Analysis*, chap. x. The best modern reference in English is, perhaps, WARD, art. *Psychology*, *Encyc. Brit.*, 64-5. See the textbooks of psychology. (G.F.S.-J.M.B.)

Localization of Sounds: Ger. *Lokalisation der Gehörsempfindungen*; Fr. *localisation des sensations auditives*; Ital. *localizzazione* (or *proiezione*) *spaziale delle sensazioni uditive*. The reference of sounds to particular localities in space. See SPACIALIZATION. (J.M.B.)

Our apprehension of the distance and direction of sounds appears to be conditioned, primarily, by the relative intensity of the waves that reach the two ears. Localization of sounds is thus a function of BINAURAL HEARING (q. v.). It is doubtful how far the pure auditory perception could have developed without visual perception; and, indeed, no explanation has as yet been proposed that is adequate in detail to the observed phenomena.

Literature: PREYER, *Pflüger's Arch.*, xl; VON KRIES, *Zeitsch. f. Psychol.*, i. 235, 488; MÜNSTERBERG, *Beitr. z. exper. Psychol.*, ii, and (with PIERCE) *Psychol. Rev.*, i. 461; RAY-

LEIGH, *Nature*, xiv. 32; SANFORD, *Course in Exper. Psychol.*, expts. 101-3; MATSUMOTO, *Yale Studies*, v. 1 ff.; SCRIPTURE, *ibid.*, 76 ff.; ANGELL and FITE, *Psychol. Rev.*, viii. 225. (E.B.T.)

Localized Industry: Ger. *Weltwirtschaft, localisirte Industrie*; Fr. *spécialisation (d'industrie) locale*; Ital. *industria locale specializzata*. The division of labour between different communities.

'We may mark off three stages of industrial development. The first is where the distinction of trades is introduced, and men no longer consume all or perhaps any part of the articles they have produced; yet where consumers live near the producer and are personally known to him. The second stage is where the element of personal acquaintance disappears. Production no longer waits for orders, but anticipates demand. The third stage is reached when increasing facilities of communication make the world one trading community. Then the localization of trades proceeds so far that one country, or perhaps one group of towns, produces the greater part of all the goods of a certain sort that are consumed throughout the world' (Walker). (A.T.H.)

Locke, John. (1632-1704.) Born at Wrington, Somersetshire, England, he was educated at Westminster School, London, and Christ Church, Oxford. Secretary to Sir Walter Vane at Berlin, &c., 1665-6; formed the acquaintance of Ashley, afterwards Earl of Shaftesbury, 1666. He entered Lord Ashley's family, directing the education of his son and grandson. As lord chancellor, Shaftesbury made him 'secretary of presentations' to benefices. He stayed in France and Italy, 1675-9, and in Holland, 1684-9. In 1690 he published his famous 'Essay,' and died at Oates in Essex, Oct. 28, 1704. He is founder of English EMPIRICISM (q. v., also SENSATIONALISM).

Locomotion (1), and (2) **Locomotor** [Lat. *locus*, place, + *motio*, a moving]: Ger. (1) *Locomotion*, (2) *Bewegungs-(werkzeug, &c.)*; Fr. *locomotion, locomoteur*; Ital. (1) *locomozione*, (2) *locomotore*. (1) The act or power of moving from place to place. (2) Pertaining to the mechanism of locomotion. See MOVEMENT, and MUSCLE. (C.F.H.)

Logic [Gr. *λογική*]: Ger. *Logik*; Fr. *logique*; Ital. *logica*. Logic is a science which has not yet completed the stage of disputes concerning its first principles, although it is probably about to do so. Nearly a hundred definitions of it have been given. It will, however, generally be conceded that

its central problem is the classification of arguments, so that all those that are bad are thrown into one division, and those which are good into another, these divisions being defined by marks recognizable even if it be not known whether the arguments are good or bad. Furthermore, logic has to divide good arguments by recognizable marks into those which have different orders of validity, and has to afford means for measuring the strength of arguments.

An approach to such a classification is made by every man whenever he reasons, in the proper sense of that term. It is true that the contemplation of a state of things believed to be real may cause the contemplator to believe something additional, without making any classification of such sequences. But in that case he does not criticize the procedure, nor so much as distinctly reflect that it is just. He can, consequently, not exercise any control over it. Now, that which is uncontrollable is not subject to any normative laws at all; that is, it is neither good nor bad; it neither subserves an end nor fails to do so. But it is only the deliberate adoption of a belief in consequence of the admitted truth of some other proposition which is, properly speaking, reasoning. In that case the belief is adopted because the reasoner conceives that the method by which it has been determined would either in no analogous case lead to a false conclusion from true premises, or, if steadily adhered to, would at length lead to an indefinite approximation to the truth, or, at least, would assure the reasoner of ultimately attaining as close an approach to the truth as he can, in any way, be assured of attaining. In all reasoning, therefore, there is a more or less conscious reference to a general method, implying some commencement of such a classification of arguments as the logician attempts. Such a classification of arguments, antecedent to any systematic study of the subject, is called the reasoner's *logica utens*, in contradistinction to the result of the scientific study, which is called *logica docens*. See REASONING.

That part of logic, that is, of *logica docens*, which, setting out with such assumptions as that every assertion is either true or false, and not both, and that some propositions may be recognized to be true, studies the constituent parts of arguments and produces a classification of arguments such as is above described, is often considered to embrace the whole of logic; but a more correct designation is Critic (Gr. *κριτική*). According to

Diogenes Laertius, Aristotle divided logic into three parts, of which one was *πρὸς κρίσιν*). This word, used by Plato (who divides all knowledge into *epitactic* and *critic*), was adopted into Latin by the Ramists, and into English by Hobbes and Locke. From the last it was taken into German by Kant, who always writes it Kritik, the initial *c* being possibly a reminiscence of its English origin. At present it is written Kritik in German. Kant is emphatic in the expression of the wish that the word may not be confounded with critique, a critical essay (Ger. Kritik). [The forms Critique and Critic are used interchangeably in this work. (Cf. CRITICISM.) (J.M.B.)]

It is generally admitted that there is a doctrine which properly antecedes what we have called critic. It considers, for example, in what sense and how there can be any true proposition and false proposition, and what are the general conditions to which thought or signs of any kind must conform in order to assert anything. Kant, who first raised these questions to prominence, called this doctrine transcendental Elementarlehre, and made it a large part of his *Critic of the Pure Reason*. But the *Grammatica Speculativa* of Scotus is an earlier and interesting attempt. The common German word is Erkenntnisstheorie, sometimes translated EPISTEMOLOGY (q. v.).

It is further generally recognized that another doctrine follows after critic, and which belongs to, or is closely connected with, logic. Precisely what this should contain is not agreed; but it must contain the general conditions requisite for the attainment of truth. Since it may be held to contain more, one hesitates to call it heuristic. It is often called Method; but as this word is also used in the concrete, methodic or methodic would be better.

For deciding what is good logic and what bad, appeal is made by different writers to one or more, generally several, of these eight sources: to direct dicta of consciousness, to psychology, to the usages of language, to metaphysical philosophy, to history, to everyday observation, to mathematics, and to some process of dialectic. In the middle ages appeal was frequently made to authority.

The appeal to direct consciousness consists in pronouncing certain reasoning to be good or bad because it is felt to be so. This is a very common method. Sigwart, for example, bases all logic upon our invincible mental repulsion against contradiction, or, as he calls it, 'the immediate feeling of necessity' (*Logic*, § 3, 2). Those who think it worth while to

make any defence at all of this proceeding urge, in effect, that, however far the logician may push his criticisms of reasoning, still, in doing so, he must reason, and so must ultimately rely upon his instinctive recognition of good and bad reasoning. Whence it follows that, in Sigwart's words, 'every system of logic must rest upon this principle.' It is, however, to be noted that among the dicta of direct consciousness, many pronounce certain reasonings to be bad. If, therefore, such dicta are to be relied upon, man not only usually has a tendency to reason right, but also sometimes has a tendency to reason wrong; and if that be so, the validity of a reasoning cannot *consist* in a man's having a tendency to reason in that way. Some say that the validity of reasoning consists in the 'definitive dictum' of consciousness; but it has been replied that certain propositions in Euclid were studied for two thousand years by countless keen minds, all of whom had an immediate feeling of evidence concerning their proofs, until at last flaws were detected in those proofs, and are now admitted by all competent persons; and it is claimed that this illustrates how far from possible it is to make direct appeal to a definitive pronouncement. Besides, say those who object to this method, all reasoning and inquiry expects that there is such a thing as the truth concerning whatever question may be under examination. Now, it is of the very essence of this 'truth,' the meaning of the expectation, that the 'truth' in no wise depends upon what any man to whom direct appeal can be made may opine about that question. *A fortiori* it does not depend upon whether I am satisfied with it or not. It is further insisted that there can be no genuine criticism of a reasoning until that reasoning is actually doubted; and no sooner is it actually doubted than we find that consciousness has revoked her *dictum* in its favour, if she ever made any. It is, indeed, maintained that so far from true is it that every system of logic must be based upon any instinctive recognition of good and bad reasoning, that it is quite impossible for any reasoning to be based upon such recognition in respect to that same reasoning. In reasoning, a man may feel sure he is right; but to 'rest' that confidence on nothing but itself is to rest it on nothing at all. If the fact that we must use our reasoning instinct in criticizing reasoning proves that we must appeal to nothing else in such criticism, it equally proves that we ought to follow the lead of that in-

stinct without any logical control at all, which would be as much as to say that we ought not to reason at all. A man cannot criticize every part of his reasoning, since he cannot criticize the act of reasoning he is performing in the criticism, it is true. But he can criticize steps whose validity he doubts; and in doing so, ought to consider in what characters the validity of reasoning consists, and whether the reasoning in question possesses those characters.

Under an appeal to psychology is not meant every appeal to any fact relating to the mind. For it is, for logical purposes, important to discriminate between facts of that description which are supposed to be ascertained by the systematic study of the mind, and facts the knowledge of which altogether antecedes such study, and is not in the least affected by it; such as the fact that there is such a state of mind as doubt, and the fact that the mind struggles to escape from doubt. Even facts like these require to be carefully examined by the logician before he uses them as the basis of his doctrine. But many logicians have gone much further, and have avowedly based their systems upon one or another theory of psychology. Another class of logicians have professed to base logic upon a psychological theory of cognition. Of course, if this is done, such psychological doctrine is placed above logical criticism, or, at any rate, above logical support. For if the truth of a conclusion is known only from certain premises, it cannot be used to support those premises. Now, it may be doubted whether psychology is not, of all the special sciences, the one which stands most in need of appeal to a scientific logic.

Appeals to the usages of language are extremely common. They are made even by those who use algebraical notation in logic 'in order to free the mind from the trammels of speech' (Schröder, *Logik*, i. p. iii). It is difficult to see what can be hoped for from such a proceeding, unless it be to establish a psychological proposition valid for all minds. But to do this, it would be necessary to look beyond the small and very peculiar class of Aryan languages, to which the linguistic knowledge of most of those writers is confined. The Semitic languages, with which some of them are acquainted, are too similar to the Aryan greatly to enlarge their horizon. Moreover, even if other languages are examined, the value of any logical inferences from them is much diminished by the custom of our grammarians of violently fitting them to the Procrustean bed of Aryan grammar.

The objection which has been suggested to appeals to psychological results applies with far greater force to appeals to metaphysical philosophy, which, it will generally be conceded, can hardly take a step with security unless it rests upon the science of logic. Nevertheless, a great many logical treatises of various colours make it their boast that they are built upon philosophical principles.

Logicians occasionally appeal to the history of science. Such and such a mode of reasoning, it is said, for example, was characteristic of mediaevalism or of ancient science; such another produced the successes of modern science. If logic is to be based upon probable reasonings, as some logicians maintain that it must be, such arguments, if critically examined, must be admitted to have great weight. They will naturally be out of place in a system of logic which professes to demonstrate from certain initial assumptions that the kinds of reasoning it recommends must be accepted.

There is probably room for dispute as to whether logic need assert anything at all as an absolute matter of fact. If it does not, any appeal to experience would seem to be irrelevant. If it does, still the opinion may be that such assertions of logic are of so exceedingly broad and slight a nature that the universal experience of every man's every day and hour puts them beyond all doubt—such experiences as that the world presents appearances of variety, of law, and of the real action of one thing upon another. As appearances, these things do not seem likely ever to be doubted. If logic has need of any facts, and if such facts will suffice, no objection can well be made to an appeal to them.

The boundary between some parts of logic and pure mathematics in its modern treatment is almost evanescent, as may be seen in Dedekind's *Was sind und was sollen die Zahlen* (1888, Eng. trans. 1901). There are, however, departments of logic, such as the logic of probable inference (if that be regarded a part of logic), in which appeal is sometimes made to mathematical results, such as Bernoulli's law of high numbers. It seems to be the general opinion that nothing so difficult as mathematics can be admitted into, or be appealed to by, the science of logic, which has the peculiarity of consisting chiefly of truisms.

In mathematical reasoning there is a sort of observation. For a geometrical diagram or array of algebraical symbols is constructed according to an abstractly stated precept, and between the parts of such diagram or array

certain relations are observed to obtain, other than those which were expressed in the precept. These being abstractly stated, and being generalized, so as to apply to every diagram constructed according to the same precept, give the conclusion. Some logicians hold that an equally satisfactory method depends upon a kind of inward observation, which is not mathematical, since it is not diagrammatic, the development of a conception and its inevitable transformation being observed and generalized somewhat as in mathematics; and those logicians base their science upon such a method, which may conveniently be termed, and is sometimes termed, a Dialectic. Other logicians regard such a method as either extremely insecure or as altogether illusory.

The generally received opinion among professors of logic is that all the above methods may properly be used on occasion, the appeal to mathematics, however, being less generally recognized.

Literature: the history of logic in Western Europe, down to the revival of learning, is given by PRANTL, *Gesch. d. Logik im Abendlande*. Upon the points upon which this author touches, he always affords valuable information, though his judgments are peremptory and slashing. Unfortunately, he omits much which was regarded by the authors of whom he treats as most important, because he does not himself so regard it. He also omits much which would be interesting to a reader taking a broader conception of logic. It is hardly necessary to say that upon some large subjects his views are controverted. Of the modern development of logic there is no satisfactory history; but there are notices good as far as they go in UEBERWEG, *Syst. d. Logik* (Eng. trans.); in the much earlier work of BACHMANN, *Syst. d. Logik* (1828); in HAMILTON, *Lects. on Logic*; and for later work in B. ERDMANN, *Logik*. CH. SIGWART, *Logic* (Eng. trans.), and WUNDT, *Logik*, may also be profitably consulted. See under the logical topics generally (e.g. EMPIRICAL LOGIC, FORMAL LOGIC, JUDGMENT, and PROPOSITION); and also BIBLIOG. C. (C.S.P., C.L.F.)

Logic (Hegel's *Logik*): see HEGEL'S TERMINOLOGY, II b.

Logic (exact): Ger. *exakte Logik*; Fr. *logique exacte*; Ital. *logica esatta*. The doctrine that the theory of validity and strength of reasoning ought to be made one of the 'exact sciences,' that is, that generalizations

from ordinary experience ought, at an early point in its exposition, to be stated in a form from which by mathematical, or expository, REASONING (q. v.), the rest of the theory can be strictly deduced; together with the attempt to carry this doctrine into practice.

This method was pursued, in the past, by Pascal (1623-62), Nicolas Bernoulli (1687-1759), Euler (1708-83), Ploucquet (1716-90), Lambert (1728-77), La Place (1749-1827), De Morgan (1806-71), Boole (1815-64), and many others; and a few men in different countries continue the study of the problems opened by the last two named logicians, as well as those of the proper foundations of the doctrine and of its application to inductive reasoning. The results of this method, thus far, have comprised the development of the theory of probabilities, the logic of relatives, advances in the theory of inductive reasoning (as it is claimed), the syllogism of transposed quantity, the theory of the Fermatian inference, considerable steps towards an analysis of the logic of continuity and towards a method of reasoning in topical geometry, contributions towards several branches of mathematics by applications of 'exact' logic, the logical graphs called after Euler and other systems for representing in intuitional form the relations of premises to conclusions, and other things of the same general nature.

There are those, not merely outside the ranks of exact logic, but even within it, who seem to suppose that the aim is to produce a calculus, or semi-mechanical method, for performing all reasoning, or all deductive inquiry; but there is no reason to suppose that such a project, which is much more consonant with the ideas of the opponents of exact logic than with those of its serious students, can ever be realized. The real aim is to find an indisputable theory of reasoning by the aid of mathematics. The first step in the order of logic towards this end (though not necessarily the first in the order of inquiry) is to formulate with mathematical precision, definiteness, and simplicity, the general facts of experience which logic has to take into account.

The employment of algebra in the investigation of logic is open to the danger of degenerating into idle trifling of too rudimentary a character to be of mathematical interest, and too superficial to be of logical interest. It is further open to the danger that the rules of the symbols employed may be mistaken for first principles of logic. An

algebra which brings along with it hundreds of purely formal theorems of no logical import whatever must be admitted, even by the inventor of it, to be extremely defective in that respect, however convenient it may be for certain purposes. On the other hand, it is indisputable that algebra has an advantage over speech in forcing us to reason explicitly and definitely, if at all. In that way it may afford very considerable aid to analysis. It has been employed with great advantage in the analysis of mathematical reasonings.

Algebraic reasoning involves intuition just as much as, though more insidiously than, does geometrical reasoning; and for the investigation of logic it is questionable whether the method of graphs is not superior. Graphs cannot, it is true, readily be applied to cases of great complexity; but for that very reason they are less liable to serve the purposes of the logical trifle. In the opinion of some exact logicians, they lead more directly to the ultimate analysis of logical problems than any algebra yet devised. See LOGICAL DIAGRAM (OR GRAPH).

It is logical algebra, however, which has chiefly been pursued. De Morgan invented a system of symbols, which had the signal advantage of being entirely new and free from all associations, misleading or otherwise. Although he employed them for synthetical purposes almost exclusively, yet the great generality of some of the conceptions to which they led him is sufficient to show that they might have been applied with great advantage in analysis. Boole was led, no doubt from the consideration of the principles of the calculus of probabilities, to a wonderful application of ordinary algebra to the treatment of all deductive reasoning not turning upon any relations other than the logical relations between non-relative terms. By means of this simple calculus, he took some great steps towards the elucidation of probable reasoning; and had it not been that, in his pre-Darwinian day, the notion that certain subjects were profoundly mysterious, so that it was hopeless, if not impious, to seek to penetrate them, was still prevalent in Great Britain, his instrument and his intellectual force were adequate to carrying him further than he actually went. Most of the exact logicians of to-day are, from the nature of the case, followers of Boole. They have modified his algebra by disusing his addition, subtraction, and division, and by introducing a sign of logical aggregation. This was first

done by Jevons; and he proposed $\cdot|$, a sign of division turned up, to signify this operation. Inasmuch as this might easily be read as three signs, it would, perhaps, be better to join the two dots by a light curve, thus Ψ . Some use the sign $+$ for logical aggregation. The algebra of Boole has also been amplified so as to fit it for the logic of relatives. The system is, however, far from being perfect. See RELATIVES (logic of).

Certain terms of exact logic may be defined as follows:—

Aggregation. The operation of uniting two or more terms or propositions, called *aggregants*, to produce an *aggregate* term or proposition which is true of everything of which any aggregant is true, and false of everything of which all the aggregants are false. It is opposed to *composition*, which is the operation of producing from two or more terms or propositions, called the *components*, a new term or proposition, called their *compound*, which is true of all of which all the components are true, and false of all of which any are false.

Absorption, law of (Ger. *Absorptionsgesetz*). The proposition that if of two aggregants one contains the other as a component, the aggregate is identical with the latter.

Alternative proposition. A term preferred by some logicians to 'disjunctive,' because the latter term is often, as by Cicero and Aulus Gellius, understood to imply that one, and one only, of the alternatives is true. At the same time, the standard traditional example of a disjunctive was 'Socrates currit vel Plato disputat,' and the rule was 'Ad veritatem disjunctivae sufficit alteram partem esse veram.' Nevertheless, the narrower sense was also recognized, and the term alternative is perhaps preferable.

Associative. An operation combining two elements is *associative* if, and only if, in combining the result with a third element, it makes no difference whether the middle element be first combined with the last and the result with the first, or the other way, so long as the order of sequence is preserved. Addition and multiplication are associative, while involution is not so; for ten to the three-square power is a milliard, while ten cube squared is only a million. An associative algebra is an algebra in which multiplication is associative.

Commutative. An operation by which two elements are united is said to be *commutative* if, and only if, it makes no difference which is

taken first. Thus, because twice three is thrice two, numerical multiplication is commutative.

Composition: see *Aggregation*, above.

Compound: see *Aggregation*, above.

Copula is often defined as that which expresses the relation between the subject-term and the predicate-term of a proposition. But this is not sufficiently accurate for the purposes of exact logic. Passing over the objection that it applies only to categorical propositions, as if conditional and copulative propositions had no copula, contrary to logical tradition, it may be admitted that a copula often does fulfil the function mentioned; but it is only an accidental one, and its essential function is quite different. Thus, the proposition 'Some favoured patriarch is translated' is essentially the same as 'A translated favoured patriarch is'; and 'Every mother is a lover of that of which she is a mother' is the same as 'A mother of something not loved by her is not.' In the second and fourth forms, the copula connects no terms; but if it is dropped, we have a mere term instead of a proposition. Thus the essential office of the copula is to express a relation of a general term or terms to the universe. The universe must be well known and mutually known to be known and agreed to exist, in some sense, between speaker and hearer, between the mind as appealing to its own further consideration and the mind as so appealed to, or there can be no communication, or 'common ground,' at all. The universe is, thus, not a mere concept, but is the most real of experiences. Hence, to put a concept into relation to it, and into the relation of describing it, is to use a most peculiar sort of sign or thought; for such a relation must, if it subsist, *exist* quite otherwise than a relation between mere concepts. This, then, is what the copula essentially does. This it may do in three ways: first, by a vague reference to the universe collectively; second, by a reference to all the individuals existent in the universe distributively; third, by a vague reference to an individual of the universe selectively. 'It is broad daylight,' I exclaim, as I awake. My universe is the momentary experience as a whole. It is that which I connect as object of the composite photograph of daylight produced in my mind by all my similar experiences. Secondly, 'Every woman loves something' is a description of every existing individual in the universe. Every such individual is said to be coexistent only with what, so far as it

is a woman at all, is sure to be a lover of some existing individual. Thirdly, 'Some favoured patriarch is translated' means that a certain description applies to a select individual. A hypothetical proposition, whether it be conditional (of which the alternative, or disjunctive, proposition is a mere species, or *vice versa*, as we choose to take it) or copulative, is either general or *ut nunc*. A general conditional is precisely equivalent to a universal categorical. 'If you really want to be good, you can be,' means 'Whatever determinate state of things may be admissibly supposed in which you want to be good is a state of things in which you can be good.' The universe is that of determinate states of things that are admissible hypothetically. It is true that some logicians appear to dispute this; but it is manifestly indisputable. Those logicians belong to two classes: those who think that logic ought to take account of the difference between one kind of universe and another (in which case, several other *substantiae* of propositions must be admitted); and those who hold that logic should distinguish between propositions which are necessarily true or false together, but which regard the fact from different aspects. The exact logician holds it to be, in itself, a defect in a logical system of expression, to afford different ways of expressing the same state of facts; although this defect may be less important than a definite advantage gained by it. The copulative proposition is in a similar way equivalent to a particular categorical. Thus, to say 'The man might not be able voluntarily to act otherwise than physical causes make him act, whether he try or not,' is the same as to say that there is a state of things hypothetically admissible in which a man tries to act one way and voluntarily acts another way in consequence of physical causes. As to hypotheticals *ut nunc*, they refer to no range of possibility, but simply to what is true, vaguely taken collectively.

Although it is thus plain that the action of the copula in relating the subject-term to the predicate-term is a secondary one, it is nevertheless necessary to distinguish between copulas which establish different relations between these terms. Whatever the relation is, it must remain the same in all propositional forms, because its nature is not expressed in the proposition, but is a matter of established convention. With that proviso, the copula may imply any relation whatso-

ever. So understood, it is the *abstract copula* of De Morgan (*Camb. Philos. Trans.*, x. 339). A *transitive copula* is one for which the mood Barbara is valid. Schröder has demonstrated the remarkable theorem that if we use *is* in small capitals to represent any one such copula, of which 'greater than' is an example, then there is some relative term *r*, such that the proposition '*S is P*' is precisely equivalent to '*S is r to P* and *is r to whatever P is r to*.' A *copula of correlative inclusion* is one for which both Barbara and the formula of identity hold good. Representing any one such copula by *is* in italics, there is a relative term *r*, such that the proposition '*S is P*' is precisely equivalent to '*S is r to whatever P is r to*.' If the last proposition follows from the last but one, no matter what relative *r* may be, the copula is called the *copula of inclusion*, used by C. S. Peirce, Schröder, and others. De Morgan uses a copula defined as standing for any relation both transitive and convertible. The latter character consists in this, that whatever terms *I* and *J* may be, if we represent this copula by *is* in black=letter, then from '*I is J*' it follows that '*J is I*.' From these two propositions, we conclude, by Barbara, that '*I is I*.' Such copulas are, for example, 'equal to,' and 'of the same colour as.' For any such copula there will be some relative term *r*, such that the proposition '*S is P*' will be precisely equivalent to '*S is r to everything*, and only to everything, to which *P is r*.' Such a copula may be called a *copula of correlative identity*. If the last proposition follows from the last but one, no matter what relative *r* may be, the copula is the *copula of identity* used by Thomson, Hamilton, Baynes, Jevons, and many others.

It has been demonstrated by Peirce that the copula of inclusion is logically simpler than that of identity.

Diagram: see LOGICAL DIAGRAM.

Dialogism. A form of reasoning in which from a single premise a disjunctive, or alternative, proposition is concluded introducing an additional term; opposed to a syllogism, in which from a copulative proposition a proposition is inferred from which a term is eliminated.

Syllogism.

All men are animals, and all animals are mortal;

∴ All men are mortal.

Dialogism.

Some men are not mortal;

∴ Either some men are not animals, or some animals are not mortal.

Dimension. An element or respect of extension of a logical universe of such a nature that the same term which is individual in one such element of extension is not so in another. Thus, we may consider different persons as individual in one respect, while they may be divisible in respect to time, and in respect to different admissible hypothetical states of things, &c. This is to be widely distinguished from different universes, as, for example, of things and of characters, where any given individual belonging to one cannot belong to another. The conception of a multidimensional logical universe is one of the fecund conceptions which exact logic owes to O. H. Mitchell. Schröder, in his then second volume, where he is far below himself in many respects, pronounces this conception 'untenable.' But a doctrine which has, as a matter of fact, been held by Mitchell, Peirce, and others, on apparently cogent grounds, without meeting any attempt at refutation in about twenty years, may be regarded as being, for the present, at any rate, tenable enough to be held.

Dyadic relation. A fact relating to two individuals. Thus, the fact that *A* is similar to *B*, and the fact that *A* is a lover of *B*, and the fact that *A* and *B* are both men, are dyadic relations; while the fact that *A* gives *B* to *C* is a triadic relation. Every relation of one order of relativity may be regarded as a relative of another order of relativity if desired. Thus, *man* may be regarded as *man coexistent with*, and so as a relative expressing a dyadic relation, although for most purposes it will be regarded as a monad or non-relative term.

Index (in exact logic): see *sub verbo*.

Many other technical terms are to be found in the literature of exact logic.

Literature: for the study of exact logic in its more recent development, excluding probability, the one quite indispensable book is SCHRÖDER, *Algebra d. Logik*; and the bibliography therein contained is so exhaustive that it is unnecessary to mention here any publications previous to 1890. Schröder's pains to give credit in full measure, pressed down and running over, to every other student is hardly less remarkable than the system, completeness, and mathematical power of his work, which has been reviewed by C. S. PEIRCE in the *Monist*, vii. 19-40, 171-217. See also C. S. PEIRCE, *Studies*

in *Logic*; *Pop. Sci. Mo.*, xii. 1; and *Proc. Amer. Acad. Arts and Sci.*, vii. 287. Cf. *SCIENTIFIC METHOD*. (C.S.P.)

Logic (of chance): see *PROBABILITY*.

Logic (of emotion): see *TERMINOLOGY*, English, 'Affective Logic.'

Logic (social): see *SOCIAL LOGIC*.

Logic (symbolic): see *SYMBOLIC LOGIC*.

Logical [Lat. *logicalis*, from *logica*, logic]: Ger. *logisch*; Fr. *logique*; Ital. *logico*. Irrespective of any facts except those of which logic needs to take cognizance, such as the facts of doubt, truth, falsity, &c.

Logical possibility is, according to usage, freedom from all contradiction, explicit or implicit; and any attempt to reform the inaccuracy would only bring confusion.

Logical necessity is the necessity of that whose contrary is not logically possible.

Logical induction is an induction based on examination of every individual of the class to which the examination relates. Thus, conclusions from a census are logical inductions. While this mode of inference is a degenerate form of induction, it also comes into the class of dilemmatic reasoning.

Logical truth is a phrase used in three senses, rendering it almost useless.

1. The harmony of a thought with itself. Most usually so defined, but seldom so employed. So far as this definition is distinct, it makes logical truth a synonym for logical possibility; but, no doubt, more is intended (Hamilton, *Lects. on Logic*, xxvii).

2. The conformity of a thought to the laws of logic; in particular, in a concept, consistency; in an inference, validity; in a proposition, agreement with assumptions. This would better be called *mathematical truth*, since mathematics is the only science which aims at nothing more (Kant, *Krit. d. reinen Vernunft*, 1st ed., 294).

3. More properly, the conformity of a proposition with the reality, so far as the proposition asserts anything about the reality. Opposed, on the one hand, to metaphysical truth, which is an affection of the *ens*, and on the other hand to ethical truth, which is telling what a witness believes to be true (Burgersdicius, *Inst. Met.*, chap. xviii).

Logical parts and whole. Parts and whole of logical extension.

Logical reasoning. Reasoning in accordance with a *LEADING PRINCIPLE* (q.v.) which thorough analysis, discussion, and experience have shown must lead to the truth, in so far as it is relied upon. But what Aristotle

understood by a logical demonstration may be seen in his *De generatione animalium*, Lib. II. cap. viii.

Logical presumption. A Wolffian term for synthetic reasoning, that is, induction and analogy; for hypothetic reasoning was not recognized as reasoning at all. The uniformity of nature is called the *principle of logical presumption*.

Logical division. Division into logical parts.

Logical distinctness. That distinctness which results from logical analysis.

Logical actuality. Kant, in the *Logik* by Jäsche (Einleitung, vii), defines logical actuality as conformity to the principle of sufficient reason, consisting of the cognition having reasons and having no false consequences; and he makes this, along with logical possibility, to constitute logical truth, which is thus used in its second sense. But in the *Critic of the Pure Reason*, in discussing the functions of judgments (1st ed., 75), he says that an assertoric proposition asserts logical actuality (Wirklichkeit, which Max Müller wrongly translates 'reality'), and makes this phrase synonymous with logical truth (which is thus used in its third, and proper, sense).

Logical definition. A strict definition by genus and specific difference. Ockham and his followers objected to the designation on the ground that the logician, as such, had no occasion to define any ordinary term, such as man (*Tractatus logices*, Pt. I. chap. xxvi). (C.S.P.)

Logical Diagram (or Graph): Ger. *logische Figur*; Fr. *diagramme logique*; Ital. *diagramma logico*. A diagram composed of dots, lines, &c., in which logical relations are signified by such spatial relations that the necessary consequences of these logical relations are at the same time signified, or can, at least, be made evident by transforming the diagram in certain ways which conventional 'rules' permit.

In order to form a system of graphs which shall represent ordinary syllogisms, it is only necessary to find spatial relations analogous to the relations expressed by the copula of inclusion and its negative and to the relation of negation. Now all the formal properties of the copula of inclusion are involved in the principle of identity and the *dictum de omni*. That is, if r is the relation of the subject of a universal affirmative to its predicate, then, whatever terms X, Y, Z may be,

Every X is r to an X ; and

if every X is r to a Y , and every Y is r to a Z , every X is r to a Z . Now, it is easily proved by the logic of relatives, that to say that a relation r is subject to these two rules, implies neither more nor less than to say that there is a relation l , such that, whatever individuals A and B may be,

If nothing is in the relation l to A without being also in the same relation l to B , then A is in the relation r to B ; and conversely, that,

If A is r to B , there is nothing that is l to A except what is l to B .

Consequently, in order to construct such a system of graphs, we must find some spatial relation by which it shall appear plain to the eye whether or not there is anything that is in that relation to one thing without being in that relation to the other. The popular Euler's diagrams fulfil one-half of this condition well by representing A as an oval inside the oval B . Then, l is the relation of being included within; and it is plain that nothing can be inside of A without being inside B . The relation of the copula is thus represented by the spatial relation of 'enclosing only what is enclosed by.' In order to represent the negation of the copula of inclusion (which, unlike that copula, asserts the existence of its subject), a dot may be drawn to represent some existing individual. In this case the subject and predicate ovals must be drawn to intersect each other, in order to avoid asserting too much. If an oval already exists cutting the space in which the dot is to be placed, the latter should be put on the line of that oval, to show that it is doubtful on which side it belongs; or, if an oval is to be drawn through the space where a dot is, it should be drawn through the dot; and it should further be remembered that if two dots lie on the boundaries of one compartment, there is nothing to prevent their being identical. The relation of negation here appears as 'entirely outside of.' For a later practical improvement see Venn, *Symbolic Logic*, chap. xi. (C.S.P.)

Logical Machine: Ger. *logische Machina*; Fr. *machine logique*; Ital. *macchina logistica* (E.M.). An instrument devised to facilitate by mechanical means the handling of logical symbols or diagrams.

There are three such instruments which merit attention:—

(1) The first was constructed by W. Stanley Jevons in 1869 (announced in his *Substitution of Similars*, 1869, 60; described in *Philos.*

Trans. Roy. Soc., 1870, 497-518; brief description in *Proc. Roy. Soc.*, 1870, 166-9, and *Princ. of Sci.*, 1874, 123-31). This instrument was preceded by the logical slate and the logical ABACUS (q. v.) (*Proc. Manchester Lit. and Philos. Soc.*, Apr. 1866, 161; *Substitution of Similars*, 1869, 54-9). In the logical slate the combinations of letters, representing all the possible combinations of a definite number of characters or qualities in a logical universe, were engraved in vertical columns upon a common writing-slate. The combinations inconsistent with given premises were then crossed off with a slate pencil, and the conclusions read off from the untouched combinations.

In the logical abacus the combinations were marked on flat slips of wood arranged in horizontal lines on an inclined blackboard having a series of ledges. The slips of wood were furnished with pins, so that those which represented combinations consistent with the premises could be lifted by means of a ruler to the ledge above.

In the logical slate, great care was necessary to cross off all the inconsistent combinations, and in the logical abacus similar care was required in picking out all the consistent combinations. The logical machine of Jevons is a logical abacus in which all that is required of the operator is to press the premises upon a series of keys; the operation of lifting the combinations consistent with the premises to the higher level being accomplished mechanically by a series of levers. By means of a lattice-work with horizontal slits, the combinations expressed in the premises and consistent with them, and these only, are exhibited to view. This machine, while manifesting considerable ingenuity on the part of the contriver, was nevertheless a cumbersome piece of mechanism. The key-board required two sets of keys, one series for the subject and one for the predicate, and four operation keys, known as the *finis*, conjunction, copula, and full-stop keys. The combinations were marked upon vertical rods, and a double set of these rods was required. The complex character of this machine rendered it unfit to be extended to problems involving more than four terms. At one time Jevons contemplated constructing a machine like it for ten terms, but found that he would have to sacrifice the entire wall-space of one side of his library.

(2) John Venn in 1881 devised a more compact instrument, which he called a logical

diagram machine (*Symbolic Logic*, 1881, 122). It was also constructed for problems of four terms. For problems of three terms he had used diagrams consisting of intersecting circles, shading out those portions which represented combinations inconsistent with given premises. For four terms, circles were impracticable, hence he used ellipses. His logical diagram machine represents four intersecting ellipses, arranged so that each section represents one of the sixteen possible combinations. These sections are arranged so as to fall below their original level when they are to be rejected as inconsistent with the premises. They are held in place by pins, and when required to fall, the appropriate pin must be removed. What corresponds to the key-board is therefore a series of sixteen pins, each of which must be individually manipulated. There is no device by which a number of sections may be moved at once. The machine is therefore merely a more cumbersome diagram. The method involved is also practically limited to problems of four terms, since the intersections made by four ellipses are already complex enough. An extension of this system would, in the words of Venn, be probably distasteful to any but a mathematician.

(3) A third logical machine was constructed by Allan Marquand in 1881 (announced in *Johns Hopkins University Studies in Logic*, 1883, 16; published in *Amer. Acad. Arts and Sci.*, 1885, 303-7). It is based upon his logical diagrams (London, Edinburgh, and Dublin, *Philos. Mag.*, Oct. 1881, 266-70). These consist of large squares, subdivided vertically and horizontally into a series of smaller squares, each of which represents one of the logical combinations. The squares which represent combinations inconsistent with the premises may then be shaded off. In his logical machine the combinations are represented by indicators which are arranged like the squares in his logical diagrams. At the outset the indicators are all pointing in a horizontal direction; the premises are then pressed upon a key-board of eight letter and two operation keys, and the indicators which represent combinations inconsistent with the premises fall to the vertical position.

In 1882 Marquand constructed from an ordinary hotel annunciator another machine in which all the combinations are visible at the outset, and the inconsistent combinations are concealed from view as the premises are

impressed upon the keys. He also had designs made by means of which the same operations could be accomplished by means of electro-magnets.

The characteristic of this machine lies in its simplicity, which may be the better appreciated as the machine is extended for problems involving more than four terms. For problems of ten terms Venn would require a new diagram of complicated form, and 1,024 keys to operate the instrument. Jevons for a ten-term machine would require 10,240 letters for his combinations, and a key-board with forty-four keys. Marquand's machine for ten terms needs only 124 letters and twenty-two keys.

There is a further difference between the machines. Jevons' presents as the conclusion not all the combinations consistent with the premises, but only those which involve the terms of the premises. For example, in a series of premises, he assumes that the only conclusion desired is the relation of the first to the last term in the series. In Venn's and Marquand's machines the inconsistent combinations only are thrown out, and all the combinations consistent with the premises are exhibited as the conclusion. Hence any term or combination of terms may be made the subject of the conclusion.

In 1883 Marquand published an account of a machine for producing syllogistic variations, which he constructed in 1881 (*Johns Hopkins University Studies in Logic*, 1883, 12-5). The two premises and the conclusion of a syllogism are written on three rectangular flaps, which are made so as to revolve on a horizontal axis. The contraposed forms of premises and conclusion are then written on the backs of the flaps. By turning a crank, the eight possible combinations of premises and conclusion are then exhibited to view.

This mechanism could be readily extended so as to exhibit similar variations for arguments involving a larger number of premises or conclusions. Marquand's logical machines are now in the Princeton Psychological Laboratory. (J.M.B.)

Logo-, &c. [Gr. λόγος, discourse, lore]: Ger. *Logo-*; Fr. *logo-*; Ital. *logo-*. Logo- (in combination) refers to the intellectual processes, and often specifically to the process introductory to speech. Thus logopathy has been used to indicate a disorder in the formation of thought for the purpose of speaking. On the other hand, logoneurosis is used as well to refer to general mental affections; while logorrhea

refers to the excessive flow of words, a common symptom in cases of mania; and logomania to the form of mania in which this occurs. (J.J.)

Logomachy [Gr., taken from the First Epistle of Paul to Timothy, vi. 4 νοσῶν περὶ ζητήσεως καὶ λογομαχίας, doting about questions and strifes of words]: Ger. *Logomachie*, *Wortstreitigkeit*; Fr. *logomachie*; Ital. *contesa di parole*. A contention (in which it is not essential that two parties should be active) not professedly relating to the use of words and phrases, but in which proper care exercised to make the ideas clear will show the critic, either that there is no important difference between the position attacked and that defended, or if there is, that the argumentation does not relate to such points.

Theology and subjects connected with it, such as the freedom of the will, have been the great theatre of such war. At present it is still kept up in logic; and other branches of philosophy are not entirely freed from it. Disputes about the propriety of modes of speech, however hot and silly they may be, are not logomachy. (C.S.P.)

Logos [Gr.]: Ger. *Logos*; Fr. *Logos*; Ital. *Il verbo*. (1) REASON (q. v.).

(2) The eternal Son of God, in whom the wisdom and power of God are manifested, and who became incarnate in the person of the historic Jesus.

In Greek thought in its earlier stages the Logos is the universal or divine reason of the world. In later Greek thought under theosophic impulses the Logos acquired a quasi personality. It is hypostatized, at least in the thought of Philo of Alexandria, who ascribes to it some mediating functions between God and the world. The Christian idea of the Logos is contained in the prologue to the Gospel of St. John, in which it is identified with the eternal Christ, who became flesh in the person of Jesus Christ. Out of this germ the Christology of the early Church developed, and was embodied in the historic creeds.

Literature: HEINZE, *Die Lehre vom Logos in d. griechischen Philos.* (1872); ZELLER, *Philos. d. Griechen*, iii; DORNER, *Hist. of the Devel. of the Doctrine of the Person of Christ*. (A.T.O.)

Lombard, Peter. (cir. 1100-63 or 64.) Educated in theology at Bologna, Rheims, and (under Abelard) Paris. Taught theology successfully at Paris, and became bishop of Paris, 1159. For his work *Sententiarum Libri IV*, he received the title 'Magister Sententiarum.'

Lotze, Hermann Rudolf. (1817-81.) Born at Bautzen, Saxony; studied medicine, natural philosophy, and metaphysics at Leipzig, where he became professor of mental philosophy in 1843. Called to Göttingen, 1844, and to Berlin, 1881, where he died soon after. He belongs to the group of philosophers known as 'Real-Idealists,' opposing Hegel on the one hand and materialism on the other hand; and he is still a most potent influence. His philosophy is characterized by subtle criticism of the concepts of physical and mental science. He was also one of the pioneers of physiological psychology.

Love [AS. *lufian*, to love]: Ger. *Liebe*; Fr. *amour*; Ital. *amore*. Dispositional INTEREST (q.v.) of an exclusive kind, having a person for its object, and manifesting itself in the following emotional states: (1) pleasure in the presence of a person or other communion with him, and in the thought of him; (2) pain occasioned by his absence or estrangement; (3) pleasure in his welfare; (4) pain occasioned by injury to him.

(G.F.S.—J.M.B.)

The word seems generally to imply exclusive interest in an individual—an interest of such a nature that no other than the particular person loved can satisfy it. There is, however, another meaning. It is possible to say I love Americans, soldiers, or 'the brethren.' It is also possible in ordinary language to use the term in connection with impersonal objects, as when we speak of 'love of truth' or 'love of beauty.' The emotions in which such interests manifest themselves are more or less analogous to those connected with attachment to persons. But the word is most properly applied to personal relations, and other usages may be regarded as derivative and metaphorical.

(G.F.S., J.M.B.)

The most important distinctions, of a psychological sort, are those (1) between love which involves the natural affections and that which is independent of them; the former is based upon predispositions of a hereditary sort, as is most strongly instanced in maternal affection. The latter sort of love is extremely complex, seeming to involve the whole range of possible interests in persons—impulsive, sensuous, intellectual, aesthetic, moral. Another distinction (2) is that typified by the difference between the love for persons respectively of the opposite and of the same sex. The former is often called 'romantic' love, and the latter 'fraternal' or 'brotherly' love; and the latter is more akin to the natural affections. Romantic love may exist, however, between

persons of the same sex. Romantic love has been the subject of the analysis of novelists, notably of the later 'psychological' school. Psychologists usually agree in recognizing in it at least the mating and the sensuous aesthetic impulse, however they may individually disagree in respect to which of these is more fundamental, if either, and in respect to the other more refined factors which contribute to the dispositions involved. Groos connects it with coyness, by which the mating instinct is regulated. The exclusiveness of the interest is much stronger in romantic love.

In romantic love the conative ingredient is very strongly shown—intruding itself into consciousness—in what is called 'longing' or 'desire' for the loved one, being a condition of extreme restlessness and mental distraction which gives peculiar quality to the pain of absence or estrangement. This is not prominent in other forms of affection or friendship—at least to the same degree. A recent writer has said: 'Friendship is a satisfaction, love is a desire.'

Literature: perhaps the most painstaking analysis is that of BAIN, *Emotions and Will* (4th ed.); the exclusiveness of the interest involved has been emphasized by ROYCE, *The Conception of God*, v. Pt. III. vi. See also GROOS, *Play of Man*, Eng. trans., 252 ff.; STENDHAL, *L'Amour* (1822); MICHELET, *L'Amour* (1858); DE ROBERTO, *L'Amore* (1897). For the psychopathology of love, see KRAFFT-EBING, *Psychopathia sexualis* (10th ed.). See also most of the textbooks of psychology, and many of the treatises given under EMOTION. Cf. SHYNESS.

(J.M.B.)

Love (metaphysical): see NEO-PLATONISM, and MYSTICISM.

Love (in theology). That attribute of the divine nature by virtue of which God rejoices in and conserves the good of his creatures.

Among the divine attributes love holds the place of supremacy, inasmuch as it is an all-comprehending emotional principle, which unites God in his creative and conserving activities with the whole creation. The special love of God for his rational creatures is one of the central doctrines of the Christian theology.

Literature: see ATTRIBUTES (of God). (A.T.O.)

Loyalty (political): see PATRIOTISM.

Lucidity [Lat. *lucidus*, light, clear]: Ger. (1) *Lucidität*, (2) *Hellsichtigkeit*; Fr. *lucidité*; Ital. *lucidità*. (1) In reference to mental

disease: the ability to think clearly and appreciate existing relations. A lucid interval in insanity is thus the throwing off of the delusions and morbid habits of thought incident to the disease, and the resumption of the normal habit. Lucid intervals are common in mania, but must not be confused with the mere remission of paroxysms or the intervals between recurrences of mania. The term is also important in a medico-legal sense.

(2) The alleged power claimed by the 'sombambulists,' the successors to Puysegur, by 'spiritists' and others, of transcending the ordinary powers of the senses, overcoming the ordinary visual limitations, and seeing things at a distance and through opaque mediums. The theory has been revived by Richet and others in the discussion of experiments in THOUGHT-TRANSFER (q. v.). See CLAIRVOYANCE. (J.J.)

Lucretius, Titus Lucretius Carus. (cir. 97-53 B.C.) Little is known as to his life. Roman citizen of noble rank. He may have studied in Athens, becoming familiar with Greek philosophy. His poem, *De rerum Natura*, revised by Cicero, and still extant, is considered the completest exposition of the theories of Epicurus. Cf. EPICUREANISM.

Ludicrous: see COMIC.

Lul, Raimon, or Lullus, Ramundus, or Lully, Raymond, also Lullius, and Lulli. (1235-1315.) Indifferently educated, although of an aristocratic Catalan family, on the island of Majorca. Became grand seneschal at the court of King Jacob of Majorca. In 1266 he was converted to Christianity, sold most of his property, devoted himself for nine years to ascetic practices and the study of Arabic. He formed the plan of converting the Moslems to Christianity by appealing to their higher reason. In 1276 he succeeded in having a college established at Miramar for thirteen Minorite friars, who were to study Arabic and fit themselves for missionary work. To expedite matters he sought a universal and infallible formula or rule, by which doubtful questions of faith could be settled. This came, he believed, as a revelation from God on Mount Randa. He wrote in three languages, his devotional poems in Catalan being of high order. Tried several times to interest the pope in his missionary plans, but failed. He wandered about teaching from place to place, making three unsuccessful efforts in Tunis to convert the Moslems, in the last of which he was martyred.

Lumen (naturale, gratiae, &c.) [Lat.]. Light; e. g. of nature (*naturale*), the natural faculties as affording knowledge, wisdom, &c.; contrasted with light of grace (*gratiae*), the illumination due to divine grace. See LIGHT OF NATURE.

The term is a scholastic and theological one, and is applied also to the various sources of 'light' or 'leading,' as light of faith (*fidei*), of knowledge (*scientiae*). Cf. Eisler, *Wörterb. d. philos. Begriffe*, sub verbo, for extensive citations. (J.M.B.)

Lunacy [Lat. *luna*, the moon]: Ger. *Irrsinn*, *Mondsucht* (popular); Fr. *folie*; Ital. *pazzia*, *lunatico* (lunatic, pop.). The term reflects a bygone notion of an intermittent form of insanity affected by the moon. It is used popularly as synonymous with insanity, and is especially prominent in the discussion of the legal relations of insanity. A lunatic is a person who comes under the legal qualifications of insanity.

The law of lunacy, the commissioners in lunacy, lunatic asylum, suggest the use of the term in its general application to insanity. The laws defining lunacy and the proceedings necessary to commit an affected person as a lunatic differ in various countries, but in almost all cases the ability to manage one's own affairs is the important consideration. See INCAPACITY, and INSANITY (and the literature there cited). (J.J.)

Lust [AS. and Ger. *lust*, desire]: Ger. (1) *Gelüst*, (2) *Wollust*; Fr. (1) *convoitise* (covetousness), (2) *impureté*; Ital. (1) *appetiti* (*bassi*), (2) *concupiscenza*. (1) Craving for immoderate self-indulgence of any sort.

(2) Restricted in popular usage and in law to inordinate sexual passion.

Usage (1) is that of the theologians, who extend the term to include 'unsanctified' desire for earthly pleasure of any sort; and of ethical writers, who, however, emphasize the lower appetences by the term and so lead to the usage (2). Cf. the New Testament (John viii. 44) for usage (1), and the 'Sermon on the Mount' (Matt. v. 28) for usage (2). (J.M.B.)

Lustre [Lat. *lucere*, to shine, through Fr.]: Ger. *Glanz*; Fr. *lustre*; Ital. *lustro*. 'We term a surface lustrous when the reflection-image which it gives is intrinsically exceedingly indistinct, or when the clear apprehension of it is prevented by irregularities of the reflecting surface. For the most part the two conditions are found together' (Wundt, *Physiol. Psychol.*, 4th ed., ii. 205).

Two illusions of lustre may be noticed: (1) Binocular. A sheen or polish arises when one half of the stereoscopic field is white and the other black or coloured. This is due to the associative transference of the conditions of objective lustre to the field seen. (2) Monocular. A similar effect can be obtained monocularly by Lambert's method of COLOUR MIXTURE (q. v.).

Literature: SANFORD, Course in Exper. Psychol., expt. 166; KIRSCHMANN, Philos. Stud., xi. 147 (to whom metallic lustre depends on the parallax of indirect vision); HERING, in Hermann's Handb. d. Physiol., III. i. 575; AUBERT, Physiol. Optik, 553; HELMHOLTZ, Physiol. Optik (2nd ed.), 932-6, 944. Stereoscopic lustre was discovered by DOVE, Berl. Akad. Berichte (1851), 246; and Pogg. Ann. (1851), lxxxiii. 480. (E.B.T.)

Luther, Martin. (1483-1546.) Born at Eisleben, Saxony. Educated at the schools in Magdeburg and Eisenach and at the University at Erfurt. Began the study of law, but changed his course, and in 1505 entered an Augustinian monastery. Ordained priest in 1507. Professor of philosophy at Wittenberg, 1508; at Erfurt, 1509; professor of theology at Wittenberg, 1510; sent to Rome (1510) on business for the Augustinian order; provincial vicar of Meissen and Thuringia, 1515. He first preached against the sale of indulgences, and in 1517 nailed his famous ninety-five theses on the door of the castle church at Wittenberg. Tried by the Diet of Augsburg, 1518; held his disputation at Leipzig with Eck, 1519; excommunicated, and burned the papal bull before his students at Wittenberg, 1520; refused to recant before the Emperor Charles V, and was seized by friends in disguise and carried to Wartburg Castle for security, 1521; returned to Wittenberg in 1522, and resumed his duties in the University. See LUTHERANISM, and REFORMATION.

Lutheranism [Lutheran, an adherent of Luther]: Ger. *Lutherthum*; Fr. *Luthéranisme*; Ital. *Luteranismo*. The system of the Lutheran Church, embracing a form of government and worship, and a confession in which the doctrines of justification by faith, supreme authority of Scriptures, total depravity and inability of man, vicarious and unlimited atonement, and real presence of Christ in the Eucharist, are essential features.

Luther stood for the reform of abuses, an open and authoritative Bible, freedom of private judgment, and justification by faith without

penance. The Lutheran Church, which is the oldest and largest of the Reformed communions, adopts as its symbols the Apostles', Nicene, and Athanasian Creeds, the Augsburg Confession, which contains its charter, together with Luther's catechisms and various modifications of the Augsburg Symbol. Holding many points in common with Calvinism, it differs from that system in less insistence on the divine sovereignty and the decrees, in the denial of limited atonement, in the doctrine of the real presence of Christ in the Eucharist, and in the greater emphasis it places on the historic evolution of the symbols of faith.

Literature: F. C. BAUER, Lehrb. d. Dogmatengesch. (2nd ed., 1857); KRAUT, Conservative Reform (1871); KAHNIS, Christenthum u. Lutherthum (1871); H. F. JACOBS, in Johnson's Univl. Cyc.; SCHAFF, in the Schaff-Herzog Cyc. of Eccles. Lit. (A.T.O.)

Luxury [Lat. *luxus*]: Ger. *Luxus*; Fr. *luce*; Ital. *lusso*. Commodities which do not produce, in those who use them, economic efficiency proportional to their cost.

A thing is a luxury if it involves a using up of accumulated power without permanent equivalent for the future. We must beware of defining luxury in terms of pleasure. The more real pleasure a thing gives, the less likelihood is there that it can be described as a luxury; for the presumption is that it will tend to increase the productive power of those who enjoy it. A pleasure becomes a luxury (1) when it is harmful to the physical or moral constitution of those who enjoy it; (2) when it involves a waste of capital or of labour power beyond what the recipient of the pleasure is stimulated by it to replace. (A.T.H.)

Lymph [Lat. *lympa*, clear water]: Ger. *Lymph*; Fr. *lymphe*; Ital. *linfa*. The fluid portion of the blood which has filtered through the walls of the blood-vessels, has nourished the various tissue elements, received from them their waste products, and which is collected in lymphatic vessels and finally returned to the blood.

In addition to fluid constituents, lymph contains colourless lymph corpuscles which have wandered (*diapedesis*) through the walls of the blood-vessels, and which are also added to the lymph stream by numerous lymph nodules located in the course of the lymphatic vessels. Lymph is thus to be distinguished from plasma, which is the fluid portion of circulating or freshly shed blood, and also from serum, which is the fluid portion of coagulated blood. (C.F.H.)

M

M — MADNESS

M. The logical symbol for the MIDDLE TERM (q. v.). (J.M.B.)

m. v. Symbol for Mean Variation. See ERRORS OF OBSERVATION. (J.M.B.)

McCosh, James. (1811-95.) Educated at Glasgow and Edinburgh; ordained minister of the Church of Scotland, 1835; took part in the organization of the Free Church, and became professor of logic and metaphysics in Queen's College, Belfast, 1843; president of the College of New Jersey at Princeton, 1868; resigned, 1888. He belonged to the Scottish school of philosophers. Cf. NATURAL REALISM.

Mackintosh, Sir James. (1765-1832.) Educated at King's College, Aberdeen, and at Edinburgh. Called to the bar at Lincoln's Inn, 1795; knighted in 1803; recorder of Bombay, 1804-6; judge of Vice-admiralty, 1806-11; returned to England, 1811, and entered Parliament, 1813; professor of law and general politics in Haileybury College, 1818-24; a commissioner of Indian affairs, 1830.

Macrocosm (and **Microcosm**) [Gr. *μακρός*, great, and *μικρός*, small, + *κόσμος*, universe]: Ger. *Makro-*, *Mikrokosmos*; Fr. *macro-*, *microcosme*; Ital. *macro-*, *microcosmo*. The great world, macrocosm, applied to the universe, when contrasted with man, the microcosm or little world, the correlation of the two terms being at the same time intended to express an analogy between them.

The idea of such an analogy is present in the Aristotelian philosophy, and was developed by the Stoics in connection with their doctrine of *πνεῦμα*, the divine reason, which is also the warm vital breath that animates and purposively pervades the universe. As the world-soul to the world, so is the individual soul (which is a part of the universal soul) related to the body; and to the universal reason

corresponds the rational or ruling part (*τὸ ἡγεμονικόν*) of the individual soul. The doctrine played a great part in the speculations of the Renaissance thinkers, e.g. in Bruno, Paracelsus, Weigel, and Böhme. In man's nature is to be found the sum or 'quintessence' of the cosmical forces. Because he unites in his body the finest essence of all material things, man is able to understand the material world. As an intellectual being, he is at the same time of 'sidereal' origin, and therefore competent to understand the world of intellectual forms, while a 'spark' of the divine, infused into his nature, enables him to become conscious of God, whose image he is. Thus man knows the universe of being only so far as he is the universe, or contains within himself the principles of all that is. In Bruno's system, not man alone, but every monad or individual substance is an immediate manifestation of the infinite life, which thus individualizes and concentrates itself everywhere throughout the universe. Each monad is thus a 'mirror' or microcosm of the all. In the system of Leibnitz, the relation between the individual monad and the universe is similarly expressed. The idea that like is known by like is, of course, as old as Empedocles, of whose theory of perception it forms the central doctrine. Cf. MONAD. (A.S.P.P.)

Literature: see the citations in EISLER, *Wörterb. d. philos. Begriffe*, 'Mikrokosmos'; also FLEMING-CALDERWOOD, *Vocab. of Philos.*, 'Microcosm.' LOTZE used the term as title of his general work *Microcosmus*. (J.M.B.)

Madness (and **Madman**) [Sansk. *mod*, to be drunk or mad]: Ger. *Manie* (*Toller*); Fr. *folie* (*fou*); Ital. *folia*, *pazzia* (*pazzo*, *matto*). A synonym of insanity, referring particularly to the disorder of reason or the uncontrollable emotion frequently characteristic

of the insane state. Madman is also used as a synonym of lunatic. See INSANITY AND SANITY, MANIA, and FUROR. (J.J.)

Magic (1) and (2) **Divination** [Gr. *μαγική*, magic, from *Μάγοι*, the priests of the Medes and Persians, and Lat. *divinare*, to foresee]: Ger. (1) *Magie*, *Zauberei*, (2) *Eingebung*; Fr. (1) *magie*, (2) *divination*; Ital. (1) *magia*, (2) *divinazione*. (1) A varied and extensive group of practices which appeal to supernal or supernatural agencies and illustrate SUPERSTITION (q. v.) reduced to practice.

Magical practices are found in almost all stages of primitive culture, and have a long and significant history in the chain of civilizations leading up to the present. While magical powers were in part derived from a deity or spirit, and were exercised like those of possession, a larger and more distinctive group of magical practices depended upon the discovery and interpretation of mystic correspondences which were occult or hidden from the popular ken. By the exertion of the will, by the careful observation of minute ceremonial rules, by the solemn enunciation of formulas and words, by the interpretation of the flight of birds or of the entrails of a beast, by casting dice and lots, by seeking the significance of personal peculiarities in a system of correspondences, and by a host of similar performances, the shaman or medicine man, the sorcerer or astrologer, the fortune-teller or exorcizer, tries to interpret the past and to influence the future, to control the forces of nature, to remove disease and evil, to bring on health and prosperity. Such proceedings are never wholly fanciful, but involve some far-fetched or misleading analogy, vague enough to permit of the adjustment of details to special cases, and yet imposing enough to impress the uncultured mind. In such practices are found some scraps of knowledge and logical tendencies which, after ages of tortuous progress, have often become the starting-points of true scientific knowledge. For the formulation of such procedure under psychological principles, based on ethnology, see Hirn as cited below.

The study of magic in primitive civilizations contributes much to the comprehension of the mental processes in undeveloped man; for it shows that in the attempt to regulate the actions of his own life, or to interpret the phenomena of nature about him, the appeal to magical hidden relations was the natural, normal process. Omens and portents, charms and fetiches, rites and offerings, divination

and sorcery were the expressions of a desire for security and for wisdom. Interpretation based upon signs, omens, &c., is called prognosis.

The history of magic in written records can only be referred to in this connection as a vast storehouse for the study of the action of the human mind under impulses and tendencies in large part inhibited or transformed, but not without effect on current beliefs. With the growth of the art of writing and the beginnings of natural science, elaborate possibilities for occult rites and systems were laid open, which were utilized alike by Assyrian or Egyptian priests, and by mediaeval astrologers.

The practice of magic or sorcery frequently came into disrepute, and was prohibited by law or even punishable by death. The distinction between 'black magic' and 'white magic' grew up as the result of such interdiction. White magic included the production of illusions and entertaining applications of physical principles, and thus became the antecedent of modern legerdemain.

(2) Divination is that form of magic which utilizes knowledge derived from some superhuman source, the knowledge being acquired by magical means.

Artificial divination is a widespread practice most largely represented in the culture stages above the lowest, though by no means absent in the lowest stages. The methods of divination and augury are almost unlimited, many of them depending on the interpretation by analogy or symbolism of the results of chance or of accidental details. Amongst natural forms of divination may be mentioned the appearances and cries of animals, dreams, configuration of hand and face, inspection of entrails, the fanciful appearance of flames of fire, or smoke, or ashes; the interpretation of charms, names and marks on the body, and so on. Over fifty terms ending in '-mancy' (divination) are cited in the literature of this topic. Of special and somewhat artificial devices invented for the purposes of divination, may be mentioned the setting up of sticks, to see whether they stand or fall, the spinning of a teetotum or similar contrivance, the throwing of dice and cards, the melting of lead or wax, pricking for texts in the Bible, and the divining rod. The last has had a specially interesting history, for which consult Barrett, *Proc. Soc. Psych. Res.*, Oct., 1900.

Of all the systems of divination, astrology, which depends upon the prediction of the

fortunes of the individual on the basis of the position of the celestial bodies at the moment of birth, has been the most elaborate and influential, and may be studied for the abundant illustrations which it offers of the mental attitude under which the processes of divination flourish. (J.J.)

From the standpoint of philosophy, it may be said that there is an element common to these various practices and superstitions by the presence of which they may be fitly described as magic. This element may be explained or set forth in detail, it can hardly be defined. The essential, or permanent, element common to all 'universes' of human experience of this sort has been most clearly elucidated by Bastian: 'Sorcery, or, in its higher expression, magic, marks the first dawning consciousness of mutual connection throughout nature, in which man, feeling himself part of the whole, thinks himself able to interfere for his own wishes or needs. So long as religion fills the whole horizon of culture, the vague groping of magic contains the first experiments which lead to the results of exact science. Magic is the physics of mankind in the state of nature. It rests on the beginning of induction, which remains without result only because in its imperfect judgments by analogy it raises the *post hoc* to the *propter hoc*.' A similar explanation is wrought out by F. B. Jevons (cited below, chap. iv). Magic, in other words, grows out of a theory of causation. And the business of philosophy is to set forth the factors in this theory, no matter how they, and other results or accompaniments, may alter, as they do alter in marvellous ways, throughout the numerous stages varying between lowest savagery, Persian and Babylonian culture, mediaeval prejudice, and modern superstition. (R.M.W.)

Magnetic Stopper: see LABORATORY AND APPARATUS, III, B, (a), (8).

Magnetism: Ger. *Magnetismus*; Fr. *magnétisme*; Ital. *magnetismo*. See Magnetic Energy, under ENERGY.

Magnitude (extensive) [Lat. *magnitudo*, bulk, size]: Ger. *Grösse*; Fr. *grandeur*; Ital. *grandezza*. That which has dimensions or extension, as a line, a surface, or a solid; called also a geometric magnitude. In other branches of mathematics than geometry the word is replaced by QUANTITY (q.v.). (S.N.)

Magnitude (intensive): see QUANTITY.

Maimon, Salomon. (1753-1800.) A Jewish rabbi and philosopher, born in Lithuania.

Maimonides (Moses ben Maimon in Hebrew; Abu Imram Musa ibn Maimun ibn Abdallah in Arabic). (1131-1204.) Known among Christian writers as R. Moyses. Early studied the Bible and the Talmud, guided by his father; also mathematics, astronomy, and medicine. Born at Cordova, he, with his family, was banished for political and religious reasons. In 1159 they were in Fez, in 1165 in St. Jean d'Acre. He settled in Cairo, followed the jeweller's trade, and became famous for learning and medical skill.

Major [Lat. *maior*, greater]: Ger. *Dur*; Fr. *majeur*; Ital. *maggiore*. One of the two fundamental scales or keys of modern music. Expressed in 'whole tones,' it runs: 1, 1, 1-2, 1, 1, 1, 1-2. Cf. MINOR, and TRIAD.

This is the natural diatonic series, represented by the series of musical tones starting from C. It corresponds to the Greek Lydian, and the ecclesiastical Tonic. Cf. Helmholtz, *Sensations of Tone*, 274.

A major interval is that form of the interval which is greater by a semitone than its corresponding minor. A major chord is a chord containing the major third above the fundamental. A major tone is one the vibration ratio of which is 8 : 9, as contrasted with the minor 9 : 10. Cf. Parry, in *Grove's Dict. of Music*, ii. 200. (E.B.T.)

Major and Minor (extreme, term, premise, *satz*, &c., in logic): Ger. *Ober- and Unter- (Begriff, &c.)*; Fr. *majeur and mineur*; Ital. *maggiore and minore*. The subject and predicate of the conclusion of a syllogism are called the extremes (*τὰ ἄκρα*, by Aristotle), because they are only brought together by the agency of the third term, called, on that account, the middle term (*ὁ μέσος ὅρος*, Aristotle). Of the two extremes, the one that is the predicate of the conclusion is called the major extreme (*τὸ μείζον ἄκρον*, Aristotle), because in a universal affirmative proposition (the typical formal proposition) its breadth is the greater, while the subject of the conclusion is the minor extreme (*τὸ ἑλάττω ἄκρον*, Aristotle).

Whether the expressions major term and minor term, for the major and minor extremes, are grammatically accurate or not, they are consecrated by usage through the scholastic period. The major and minor premises are respectively those which contain the major and minor extremes. Aristotle (*I. Anal. Pr.*, ix) calls the former *ἡ πρὸς τὸ μείζον ἄκρον πρότασις*, 'the proposition about the major extreme.' (C.S.P.)

Majority (in law): see INFANT.

Make-believe: Ger. (1) *Vortäuschen*, *bewusster Schein*; Fr. (1) *feinte*, *faux semblant*; Ital. (1) *finzione*. (1) The indulgence in SEMBLANCE (q. v.) with consciousness of, or for the sake of, the effect upon another.

As is pointed out under semblance, that state of mind may involve self-illusion or not. In the higher forms of semblance, there is the keeping up of the artificial situation without self-illusion, but with direct reference to the effect upon an observer, a more or less explicit attempt to make another believe,

and so to sham. It is recommended that the term make-believe be confined to this more particular aspect of the consciousness of semblance. The term sham—especially the verbal forms (e.g. shamming)—may well be used as a synonym. The shamming of disease and the symptomatic forms of deception in certain diseases, known as malingering, illustrate make-believe.

(2) The consciousness of unreality attaching to certain mental constructions, notably those of play and art. See SEMBLANCE (also for foreign equivalents), which is preferable in this broad meaning; and cf. ART AND ART THEORIES.

(3) Used in biology for the attitudes of feigning (e.g. the opossum's feigning death), a form of SEMBLANCE (q. v.) which is largely instinctive, and probably only slightly, if at all, conscious. (J.M.B., G.F.S.)

Male [Lat. *masculus*]: Ger. *männlich*; Fr. *mâle*; Ital. *maschio*. The primary meaning refers to the individual capable of producing spermatozoa or the homologous elements in the lower animals or in plants. By extension it is applied (1) to characteristics of a male individual, especially such as are sexually distinctive; (2) to the spermatozoa or other sexual elements produced by a male individual or the male gland of an hermaphrodite. Cf. SEX. (C.S.M.)

Malebranche, Nicolas. (1638-1715.) Born of a wealthy and respectable family. He was too poor in health to attend school. Studied theology at the Sorbonne. Read Descartes in 1664, and devoted himself to philosophy.

Malevolence (or **Malice**) [Lat. *malevolentia*]: Ger. *Bosheit*, *Böswilligkeit*; Fr. *malice*, *méchanceté*; Ital. *malevolenza*, *cattiveria*. The disposition to bring pain or misery to another or to take pleasure in it.

The nature of malevolence and the possibility of disinterested malevolence have been discussed by the English moralists. Hutcheson describes 'disinterested malice or delight in the misery of others' as the highest pitch of what we count vicious; and, according to Butler, 'the utmost possible depravity which we can in imagination conceive is that of disinterested cruelty.' At the same time, both doubt the possibility of its being genuinely disinterested. 'Human nature,' says Hutcheson, 'seems scarce capable of malicious disinterested hatred, or a sedate delight in the misery of others'; and Butler holds that 'as there is no such thing as self-hatred, so neither is there any such thing as ill-will in

one man towards another, emulation and resentment being away.' By Bentham the 'pleasures of malevolence' are recognized as motives corresponding with the 'pleasures of benevolence.' Cf. MALICE (in law). (W.R.S.)

It is interesting to ask whether there is not an aesthetic factor in malevolence, as there is in most benevolence and sympathy. There can be no doubt that many of the actions ordinarily ascribed to malice are better explained from the elements of play and of the comic involved in the production of grotesque and unusual situations. The aesthetic motive described by recent writers (e.g. Groos) as 'pleasure in being a cause' enters into much that passes for malice, as in painful practical jokes, cruel wit, &c. Furthermore, the very fact that the pain—and in cases of sympathy, the pleasure—is in another, makes it possible to take a contemplative attitude towards it as towards the element of semblance (*Schein*), which in the aesthetic psychosis is contrasted with actual personal experience. It may be the writhing, not the pain, of the pinned-down insect that interests. Delight in the repulsive seems to have one element, at least, of aesthetic contemplation—disinterestedness—at its purest; and it is quite possible that disinterested malice springs from a similar root. It is interesting to note that we often take pleasure—and it is quasi-aesthetic—in certain of our own pains (cf. Hirn, *Origins of Art*, chap. v). (J.M.B.)

Literature: HUTCHESON, *Inquiry*, §§ 1 and 2; BUTLER, *Sermons*, pref. and i; BENTHAM, *Princ. of Mor. and Legisl.*, chap. x; BAIN, *Emotions and Will* (3rd ed.), 66, 187 ff. (W.R.S.)

Malfeasance [Fr. *malfaisance*; from *mal*, evil, + *faire*, to do]: Ger. *Missethat*, *Übelthat* (that which is wrongfully done); Fr. *méfait*, *méchanceté* (that which is wrongfully done); Ital. *misfatto*. Doing wrongfully what could not be done rightfully; as distinguished from doing wrongfully what could be done rightfully, which is termed *misfeasance*, and from *non-feasance*, which is not doing what one has undertaken to do. Malfeasance, however, is often used inaccurately for misfeasance.

Malfaisance, in French, signifies a disposition to do ill to another; not the doing of ill. (S.E.B.)

Malice: see MALEVOLENCE.

Malice (in law): Ger. *Bosheit*; Fr. *malice*; Ital. *malizia*. The evil intent to do a wrongful act injurious to another. By a legal fiction, such an intent* is sometimes imputed where it did not exist, and is then termed malice in

law, as distinguished from malice in fact (see Markby, *Elements of Law*, §§ 686, 687).

Where one causes another to be prosecuted for an alleged crime, without reasonable cause, and the result is an acquittal, he is liable for a 'malicious prosecution,' and malice is implied, though there was none in fact. Malice is a necessary ingredient of the crime of murder, being styled in that connection malice aforethought or malice prepense. (S.E.B.)

Malthus' Law: Ger. *Malthus'sches Gesetz*; Fr. *loi de Malthus*; Ital. *legge di Malthus*. An alleged tendency of population to increase in geometrical progression while subsistence increases only in arithmetical progression. The former therefore tends to outstrip the latter, until the inadequacy of food supply brings disease and reduces numbers within the necessary limits. The principle is known as MALTHUSIANISM.

In the first edition (1798) of his *Essay on the Principles of Population*, Malthus stated the law substantially as here given. In subsequent editions he laid more relative stress on the possibility of 'preventive checks,' which should avoid the fatal geometrical increase, and thus preclude the need for the positive check of famine and disease. Modern critics have sometimes said that this amounts to an abandonment of the whole position; for these preventive checks, they claim, are so far automatic that the whole geometrical-progression theory falls to the ground. Other critics insist that the limitation of the food supply is not nearly so rigid as Malthus assumed. The principle of Malthus suggested to both Darwin and Wallace the 'struggle for EXISTENCE' (q.v.) in the animal world, upon which the law of NATURAL SELECTION (q.v.) was based (see Poulton, *Charles Darwin*, 46, 88, 89; and cf. EXCESS, and PRODIGALITY OF NATURE).

Literature: BONAR, *Malthus and his Work*; K. PEARSON, *The Chances of Death*, i. (A.T.H.)

Malthusianism: see MALTHUS' LAW.

Malum (in law) [Lat.]. *Malum prohibitum*: an act wrong because prohibited by positive law, though not necessarily bad in the view of moral reason or natural law. *Malum in se*: an act which is wrong in the view of reason or natural law. (S.E.B.)

Mammal [Lat. *mammalis*]: Ger. *Säugethier*; Fr. *mammifère*; Ital. *mammifero*. One of the Mammalia, the highest class of vertebrates, containing all the animals with milk glands (*mammæ*) for the nourishment of the young during a variable period after birth.

The mammals are all air-breathing, warm-blooded animals, with a more or less hairy covering, a four-chambered heart, a sinistral aorta, and a complete diaphragm separating the pleural and abdominal cavities. The four last characteristics distinguish them from all other vertebrates, the four-chambered heart of birds being dextral in plan.

The blood of adult mammals contains non-nucleated red corpuscles of smaller size than the red corpuscles of other vertebrates, which are invariably nucleated throughout life. The class is subdivided into three sub-classes: (1) the monotremes, of which the duck-bill or ornithorhynchus is the best-known representative; (2) the marsupials, of which the opossum and kangaroo are the most familiar types; and (3) the placental mammals, which include the majority of living forms, and with which man is classed in the order of PRIMATES (q.v.). The habit of nourishing the young after birth has been a chief factor in the evolution of family life, and is therefore intimately correlated with the development of the brain, the size and complexity of which is, from the biological standpoint, by far the most important characteristic of the Mammalia. The phylogenetic origin of the Mammalia has not been determined, but it seems probable that they arose from forms belonging to the amphibian type, although many authorities maintain that their immediate ancestors were reptilian. The earliest unquestionable mammalian fossils have been found in the Jurassic strata.

Literature: FLOWER and LYDDEKER, Mammals; FLOWER, Osteol. of the Mammalia; PARKER and HASWELL, Zoology, ii; LECHE, Säugethiere, in Bronn's Thierreich; see also the Roy. Nat. Hist.; BREHM, Thierleben. On the evolution of the mammals: WIEDERSHEIM, Der Mensch; HUBRECHT, Princeton Lectures; HAECKEL, System. Phylogenie; the Proceedings and reports in Nature of the Int. Zool. Cong. (1897) discussion on the origin of mammals. (C.S.M.)

Man [AS. *man*]: Ger. *Mensch*; Fr. *homme*; Ital. *uomo*. See MANKIND, ANTHROPOID, ANTHROPOLOGY, PSYCHOLOGY, EVOLUTION, SEXUAL CHARACTERS.

Man (doctrine of, in theology): see ANTHROPOLOGY (theological).

Manes (or **Manichaeus**). (cir. 216–cir. 277 A.D.) Appeared in Babylon (242 A.D.) as a religious teacher. Being unsuccessful there he spent his life wandering. Like the Gnostics, he combined into a world conception elements

taken from various sources. In place of Jewish monotheism he took Persian dualism as a foundation for MANICHAISM (q.v.).

Mania [Gr. *μανία*, madness]: Ger. *Manie*; Fr. *manie*; Ital. *mania*. Mental disease involving irresistible and uncontrollable or uncontrolled habit, desire, or craving, with unreasonable or inadequate motives. In psychiatry it is also used symptomatically—to designate certain groups of symptoms.

I. Symptomatic usage. All the phases of general excitement bearing the feature of lack of control are loosely called mania, and when very marked, frenzy. One symptom-complex, which is frequently called mania, although there is no general excitement, and which presents imperative or dominant ideas or habits of conduct, is considered in the article MONOMANIA. True general maniacal excitement occurs in several well-distinguished forms:—

(1) As delirium (delirious mania): implying a maniacal delirium without any of the known somatic foundations for delirium, such as acute typhoid, acute articular rheumatism, pneumonia, grippe, &c.; but sometimes following these diseases or lasting longer than the fever, or coming on after profound exhaustion (collapse delirium) or without any adequate cause: all these forms of excitement are marked by hallucinations, confusion, and disorientation, and often violent raving. Unless exhaustion, injuries, or intercurrent diseases cause death, a favourable course is the rule. It is not always easy to distinguish this form from other delirious states—phases of KATATONIA (q.v.), dementia praecox, manic-depressive insanity, &c.

(2) As an episode of the manic-depressive psychoses (Kraepelin): a typical condition of uncontrollable motor excitement, feeling of strength and well-being, and exhilaration, together with a characteristic flight of ideas and disorder of the stream of thought, with frequent rhyming and inability to keep to one topic or to keep in mind a true picture of the actual state of affairs, with great distractability and irritability of emotional tone, with isolated delusions and (rarely) hallucinations. The untiring activity of the patient usually appears quite spontaneous, though often poorly planned and rapidly shifting; it is varied, rich in all sorts of whims, and, although frequently theatrical, free from senseless stereotypy. The attack is frequently ushered in by depression; and occasionally excitement and depression vary in irregular or

regular intervals, every other day or month, or with the seasons, or after intervals of normal health. The excitement of these forms is so characteristic that the term manic is exclusively applied to it in distinction from the general term maniacal, used for all forms of excitement. For slight forms the term hypomania is used.

(3) As the onset of dementia praecox (hebephrenia or katatonia): the excited phases of the processes of deterioration of Kraepelin. This type is devoid of many of the expansive features of the manic excitement, and is characterized by monotonous, stereotyped manners, strained or forced actions, impulsive outbreaks, silly attitude, and often absurd delusions, frequently of a sexual or religious trend. Cataleptic episodes, hallucinations (God urging the patient to take certain attitudes, not to eat, &c.), and delusions of mysterious influences are quite common; with it all, the patient's mind is often remarkably clear.

(4) As the excitement of general paralysis: often difficult to recognize unless the manifestations or subject matter of the excitement become very absurd, as in MEGALOMANIA (q.v.), and the somatic symptoms (disorder of speech, &c.) are obvious.

(5) As a form of alcoholic insanity: protracted delirium tremens, with the typical hallucinations (snakes, small animals, the devil, &c.), with more or less marked fear; or alcoholic delusional insanity, with or without hallucinations of hearing, centring about persecution, jealousy, &c.

(6) As senile mania: episodes of excitement in senility, often merely states of confusion and bewilderment, or restlessness over delusions concerning property, &c.

(7) As episodes following epileptic attacks, or taking the place of epileptic attacks: equivalents of the characters of acute frenzy.

(8) Many statistics include as chronic mania excited cases of dementia or paranoic conditions.

II. As a name for real diseases or PSYCHOSES (q.v.) the use varies extremely. Those who classify the forms of insanity merely from the point of view of exaltation, depression, and intellectual disorders, remain on purely symptomatic ground and use in a descriptive and retrospective way, without any further discrimination, the expressions acute, sub-acute, recurrent and chronic mania, according to the form of onset, duration, and course, including all the above types with the exception of the alcoholic, paralytic, epileptic, and

senile forms. Kraepelin has made it extremely probable that the periodic or recurrent manic attacks, varying with attacks of depression, and described under (2), form a characteristic disease-entity, the manic-depressive insanity, distinct from the processes of deterioration. This form rarely occurs once only, but usually recurs, or alternates with depression with varying intervals of the normal condition, and the patients rarely become permanently demented. Even after a large number of attacks complete recovery is possible. Such facts suggest the view that manic states are merely an expression of an as yet unknown disease-process, which may likewise express itself as an attack of melancholia, or any other equivalent of manic-depressive insanity, just as a convulsion or some equivalent state is an expression of epilepsy. The types included in this disease-entity are the manic forms, certain semi-delirious ones, certain stuporous and depressed ones, and certain paranoic episodes and mixed forms. For the other forms of excitement the term mania had better be avoided.

Interesting psychophysical experiments exist on the peculiarities of association, writing, and reaction-times, during mania.

Literature: MENDEL, Die Manie (1881); KRAEPELIN, Psychiatrie (1899), ii. 359-425, and Das manisch-depressive Irresein; O. B. in den Jahren 1887-95, Diss. Freiburg (1897); ERP TAALMAN KIP, Acute Manie, Allg. Zeitsch. f. Psychiat., liv. 119 (1897). (A.M.)

Manichaeism: Ger. *Manichäismus*; Fr. *manichéisme*; Ital. *manicheismo*. The doctrine of MANES (q.v.). A dualistic system in which two co-ordinate principles of good and evil, symbolized by light and darkness, are represented as engaging in an eternal conflict in the world and in the nature of man; the struggle in man's nature taking the form of

a contest between flesh and spirit, in which the triumph of spirit is to be secured by the practice of a rigorous discipline.

The system of Manes was a modification of the old Persian dualism, the modifying elements being derived from Buddhism and Syrian Gnosticism, with some ideas borrowed from Christianity. While the motive of it was religious, it aimed rather at knowledge than moral purity, and was essentially a form of gnosis. It had a wide following, and powerfully influenced some of the greatest thinkers of the time, notably St. Augustine, who continued under its influence for several years, but finally rejected it and became its most uncompromising foe. Most of the essential features of Manichæism are found in the older system of Zoroaster.

Literature: F. C. BAUER, *Manichäisches Religionssystem*; MOSHEIM'S and GEISLER'S *Eccles. Histories*; MCCLINTOCK and STRONG, *Schaff-Herzog Cyc. of Eccles. Lit.* (A.T.O.)

Manifestation (in theology) [Lat. *manifestatio*]: Ger. *Offenbarung*; Fr. *manifestation*; Ital. *manifestazione*. The self-revelation of the Deity to man, in and through nature or consciousness, by ordinary or superordinary agencies.

The term is used more especially of God's revelation of his nature and will in his Son Jesus Christ, and in the work of the Holy Spirit; also in the Holy Scriptures, which are a revelation of his will, according to Christian teaching.

Literature: see REVELATION. (A.T.O.)

Manifoldness (or **Assemblage**): see MATHEMATICS.

Mankind [ME. *mankinde*]: Ger. *Menschheit*; Fr. *homme*, *humanité*; Ital. *genere umano*, *umanità*. The human race considered collectively.

The study of mankind has led to the formulation of the general science of ANTHROPOLOGY (q.v.), while at the same time other sciences with other primary purposes yield much valuable knowledge concerning man, his position in nature, and his occupations, endowments, and history. The specific study of the races of mankind becomes the purpose of ETHNOLOGY and ETHNOGRAPHY (q.v.). See also RACE. Many important anthropological and ethnological works bear the title 'History of Mankind'; such as that by Ratzel (3 vols., trans. from 2nd ed., 1896-8). The term 'Natural History of Man' (e.g. the works of Prichard, 2 vols., 4th ed., 1855; Wood, 1868-70, edited by Kingsley, 1885) is used in the

same sense. The mental and moral life of mankind is treated by the sciences of PSYCHOLOGY, ETHICS, HISTORY, SOCIOLOGY, &c. (see those terms). (J.J.)

Mansel, Henry Longueville. (1820-71.) Educated at Merchant Taylors' School and at St. John's College, Oxford. He was an Oxford fellow in 1842; ordained priest in the Anglican Church in 1845; reader in moral and metaphysical philosophy, Oxford; Bampton Lecturer, 1858; Waynflete professor of philosophy, 1859; Regius professor of ecclesiastical history and canon of Christ Church, 1867; dean of St. Paul's, 1868. He was born at Cosgrove, Northamptonshire, and died at London, England.

Many: see ONE AND MANY, and cf. NUMBER (different articles).

Marcus Aurelius Antoninus. (121-180 A.D.) A prominent Stoic philosopher. Adopted as a son by Emperor Antoninus Pius in 138 A.D. As emperor he was engaged in frequent wars. In 175 he visited Egypt and Syria. He founded a chair of philosophy in Athens for each of the sects—Stoic, Platonic, Peripatetic, and Epicurean.

Mare clausum and **Mare liberum** [Lat.]. *Mare clausum*: a sea closed, by authority of a particular sovereign claiming special privileges or rights in it, to general navigation. *Mare liberum*: a sea open to navigation by all, freely. Such, it is now universally conceded, are the high seas.

'Et quidem naturali iure communia sunt omnium haec: aer, aqua profluens, et mare, et per hoc littora maris' (*Inst. of Just.*, ii. 1, *de rerum divisione*, 1). A contrary view was supported by the popes in the middle ages, and by Spain and Portugal, claiming exclusive rights by discovery and under papal decrees over the western and southern seas. English jurists in the 17th century, while disputing those claims, set up a claim of English sovereignty as to the northern seas (see Selden, *Mare Clausum*, 1635, and Grotius, *Mare Liberum*, 1609). Russia made a similar claim as to the North Pacific as late as the beginning of this century, on the ground of riparian ownership (see Davis, *Int. Law*, 43).

Margin of Cultivation: Ger. *Kulturgrenze* (K.G.); Fr. *marge de culture* (L.M.); Ital. *limite di coltivazione*. The point at which, either on account of distance from

MARGINAL INCREMENT

market or lack of natural advantages, the value of the products of land barely covers the expense of producing them.

It was by assuming a point of this kind that Ricardo laid the basis of his theory of economic rent. If the demand was such as to necessitate the use of a certain piece of land in supplying a market, the price must be made high enough to cover the expense of production on this land. If other land was better located or more fertile, it would afford the owner a surplus above expenses equal to its advantages over land at the margin of cultivation. (A.T.H.)

Marginal Increment: Ger. *Grenz-* (in combination), *marginal*; Fr. *élémentaire* (*marginal*); Ital. *incremento marginale*. A very small variation in an economic quantity. If the quantity is regarded as changing discontinuously, the term corresponds to finite difference in physics; if it is regarded as changing continuously, it corresponds to differential. See CALCULUS.

It has gradually been discovered that equilibrium in economics, no less than in physics, depends upon differential equations, and may be explained more satisfactorily by differential analysis than by mass analysis pure and simple.

The beginning of this analysis is seen in Ricardo. He rejected Smith's proposition that there is in each community an average rate of rent which the price of food must cover. He showed that, theoretically and to a large extent in practice, the land in use actually varies from a high degree of fertility and productiveness to a low degree. The land which it just pays to cultivate represents, according to Ricardo, the 'margin of cultivation.' The price of the products must just pay wages and profits on this land, otherwise it will go out of use; it cannot be more than this, or some worse land will come into use. Thus the price of the product is a function not of the average productivity of land in use, but of the marginal productivity; and rent is not, as Smith thought, a determining element in price, but a differential gain. Walker applied the same analysis to profits, showing that that part of profit which was due to human skill rather than to capital invested was subject to the same laws as the rent of land; that there was a margin of skill, at which an employer could just maintain himself and no more; that the price of products must, in general, cover wages and interest at this margin; and that

surplus profit was a differential gain no less than surplus rent.

The analysis of the effect of marginal utility upon demand came later than the analysis of the effect of marginal expense upon supply. The observed rule that increased quantities consumed in a given time produced diminished increments of pleasure or pain was applied by Gossen (1854), Jevons (1871), and Menger (1871) to show what limits were set to the possibility of marketing products, and, consequently, to the cost which could be incurred for that purpose. Marshall further showed that the consumers, to whom the products had a utility higher than that at the margin, obtained a differential gain analogous to that of the landowners, which he called CONSUMER'S RENT (q. v.).

If we represent quantities produced and consumed on an axis OX , and prices, which may serve as representative of enjoyment or sacrifice, on an axis OY , we shall find that the quantity marketed, Oq , will normally be produced at a marginal expense qx , equal to the marginal utility to the man who is just willing to buy it. In other words, the sacrifice to the last producer just balances the advantage (OPHELMITY, q. v.) to the last consumer. But some producers have such advantages in location or skill that their actual expense is much less than qx , going down as low as Oc : Competition, by allowing them to receive the market price for their products, gives them an advantage cxp in the form of rent or profits. And some consumers have a similar advantage in utility, which may go as high as Oq . Competition, by allowing them to get their products at the market price, gives them a similar advantage nqp , which we may call consumer's rent.

In this apparently very beautiful analysis there is a fallacy. The whole theory of utility to the consumer as commonly stated is based upon increasing rapidity of stimulus, i. e. rates

of production. The Ricardian law of rent and the whole analysis of cost to producers is based upon the need of increasing quantity of production—more appliances at the old rate of speed. We are really putting two curves into the same figure, which are radically different in their principles of construction. It is too early to say how far this difficulty vitiates our analysis of the subject of consumer's rent.

Marginal Utility: see FINAL UTILITY.

Marheineke, Philipp Konrad. (1780–1846.) Educated at Göttingen. Professor of theology at Erlangen, 1805; at Heidelberg, 1807; at Berlin, 1811, where he was pastor of Trinity Church.

Mark [AS. *mearc*, a bound]: Ger. *Merkmal*; Fr. *marque*, *attribut*; Ital. *segno* (*contrassegno*), *nota*. To say that a term or thing has a mark is to say that of whatever it can be predicated something else (the mark) can be predicated; and to say that two terms or things have the same mark is simply to say that one term (the mark) can be predicated of whatever either of these terms or things can be predicated.

The word translates the Latin *nota*. It has many practical synonyms, such as quality, mode, attribute, predicate, character, property, determination, consequent, sign. Most of these words are sometimes used in special senses; and even when they are used in a general sense, they may suggest somewhat different points of view from mark. (C.S.P., C.L.F.)

A great oversight which had vitiated the entire discourse of logicians about marks, and had prevented them from fully understanding what marks are, was corrected by Augustus de Morgan when he observed that any collection whatever of individuals has some mark common and peculiar to them. That it is so will appear when we consider that nothing prevents a list of all the things in that collection from being drawn up. Now, the mere being upon that list, although it has not actually been drawn up, constitutes a common and peculiar mark of those individuals. Of course, if anybody tries to specify a number of individuals that have no common and peculiar mark, this very specification confers upon their common and peculiar mark a new degree of actuality.

On the other hand, if two marks are common and peculiar to precisely the same collection of things, they may, for the ordinary purposes of formal logic, be looked upon as the same mark. For it is indifferent to formal logic how objects are marked, whether in a simpler or more complex way. We may, therefore, regard the two marks as constituting together a single mark. Marks, after all, are not the object of logical study; they are only fictitious aids to thought. (C.S.P.)

Market [AS. *market*]: Ger. *Markt*; Fr. *marché*; Ital. *mercato*. A place where prices are determined by competition and made to equalize demand with supply. An extension to modern conditions of the ideas of the mediaeval market or fair.

It makes no difference whether the goods are actually exposed for sale, as in the mediaeval markets, or largely bought and sold on the basis of warrants and telegraphic orders, as in the produce exchanges of to-day. The essential thing is that different buyers and sellers shall know something about one another's transactions, so that the individual buyer need not pay more than the prevailing rate, nor the individual seller be forced to accept less than the prevailing rate.

There may be different markets for the same article in the same place. The prices in the wholesale market may be determined by one set of conditions, and those in the retail market by another. (A.T.H.)

Marriage [Lat. *maritus*, husband, through Fr.]: Ger. *Ehe*; Fr. *mariage*; Ital. *matrimonio*. Any more or less permanent union of the sexes that is sanctioned by the community.

The earliest sanction is no more than a vague general approbation. Later sanctions have explicit legal expression, and assume the form of severe penalties for disobedience of legal prohibitions. The use of the term marriage by many ethnologists, including Westermarck (*Hist. of Human Marriage*), to designate any union of the sexes, sanctioned or not sanctioned, including the mating of animals, is erroneous. The correct use was indicated by J. F. McLennan in the correspondence with Charles Darwin, reproduced in McLennan's *Studies in Ancient History*, second series. McLennan held that polyandry was the first form of marriage, as distinguished from mere mating. Slowly and by many tentative experiments society has arrived at monogamous marriage of individuals not within the first and second degrees of

consanguinity, by prohibiting, successively, incest, polyandry, polygamy, and bigamy. The marriage laws of Europe and America still bear the impress of the deliberations of the Council of Trent. (F.H.G.)

Literature: McLENNAN and WESTERMARCK, as cited (the latter having an extensive bibliography); STARCKE, *The Primitive Family*. See also under FAMILY. (J.M.B.)

Marsilius Ficinus: see FICINO, MAR-SIGLIO.

Martineau, James. (1805-1900.) An English writer in moral and religious philosophy. Of Huguenot ancestry, he was born in Norwich. He attended successively the Norwich Grammar School, Lant Carpenter's private school at Bristol, and a school for engineers at Derby. Changing his plans, he studied theology for five years at Manchester College, situated at that time at York. Admitted to preach, 1827; ordained in Dublin, 1828, he moved to Liverpool. In 1839 he took a prominent part in the Liverpool Controversy, and in 1840 he was appointed professor of mental and moral philosophy in Manchester New College, a position which he held until 1885.

Martyr, Justin: see JUSTIN MARTYR.

Mass [Lat. *missa*, dismissal]: Ger. *Messe*; Fr. *messe*; Ital. *messa*. The Sacrament of the Eucharist as administered in the Roman and Greek Churches, in which, through the separate consecration of the bread and wine, the sacrifice of Christ is exhibited and the real body and blood of Christ are received in the communion.

There are several species of Masses, as High Mass, which is accompanied with chant, incense, and the assistance of deacon and subdeacon; Low Mass, which lacks these accompaniments; Requiem Mass, celebrated for the dead; and Pontifical Mass, celebrated by the bishop.

Literature: see SACRAMENT, and TRAN-SUBSTANTIATION. (A.T.O.)

Mass (in physics) [Lat. *massa*, a lump]: Ger. *Masse*; Fr. *masse*; Ital. *massa*. The quantity of matter in a body, as measured by the amount of its inertia or the amount of force necessary to produce in it a given motion in a given time, it being entirely free to move in the direction of the force.

The weight of the body at a given place is equally a measure of its mass, and the only measure that can be readily applied in practice. Experiment shows the results of the two measures to be identical, since weight, or gravity, and inertia have the same ratio for

all substances. All bodies retain their mass unchanged, whatever transmutations they may undergo. (S.N.)

Material. MATTER (q.v.), or, as adjective, belonging to or composed of matter. See also MATTER AND FORM, and cf. topics in FORM and FORMAL. (J.M.B.)

Material Fallacy. This term originated with Whately (*Encyc. Metropolitana*, i. 218 b). Whately's material fallacies are those in which the conclusion does follow from the premises. Therefore, excluding the multiple interrogation, which is no syllogism, of the rest of Aristotle's thirteen, only the *ignoratio elenchi* and the *petitio principii* are material. Cf. FALLACY (also for foreign equivalents).

Aldrich had modified Aristotle's division into fallacies *in dictione* and fallacies *extra dictionem*; making a division into *Sophismata in forma argumenti* (*sicubi conclusio non legitime consequatur ex praemissis*), and *Sophismata in materia argumenti* (*sicubi legitime non tamen vere concludere videatur syllogismus*). Under the latter head he placed the *ignoratio elenchi*, the *non causa pro causa*, the *non sequitur*, and the *petitio principii*. Whately's distinction is—whether from a theoretical or a practical point of view—by far the most important that can be drawn among fallacies; so that besides the reason of priority, which ought itself to be final, the needs of the logician forbid us to depart from Whately's definition. Some logicians do not admit material fallacies among the number of fallacies, but consider them to be faults of method (Hamilton, *Lects. on Logic*, xxvi; Ueberweg, *Syst. d. Logik*, §§ 126, 137). E. E. Constance Jones (*Elements of Logic as a Science of Propositions*, § xxvi) reduces them to formal fallacies. Hyslop (*Elements of Logic*, chap. xvii) uses the term material fallacy, quite unjustifiably, to include all fallacies due to something in the matter of reasoning. (C.S.P.)

Material Logic: Ger. *materielle Logik*; Fr. *logique matérielle*; Ital. *logica materiale*. Formal logic classifies arguments by producing forms in which, the letters of the alphabet being replaced by any terms whatever, the result will be a valid, probable, or sophistic argument, as the case may be; material logic is a logic which does not produce such perfectly general forms, but considers a logical universe having peculiar properties.

Such, for example, would be a logic in which every class was assumed to consist of a finite number of individuals; so that the

sylogism of transposed quantity would hold good. In most cases material logic is practically a synonym of applied logic. But a system like Hegel's may also properly be termed material logic. The term originated among the English Occamists of the 14th century, who declared Aristotle's logic to be material, in that it did not hold good of the doctrine of the Trinity. (C.S.P.)

Materialism [Lat. *materialis*, material]: Ger. *Materialismus*; Fr. *matérialisme*; Ital. *materialismo*. That metaphysical theory which regards all the facts of the universe as sufficiently explained by the assumption of body or matter, conceived as extended, impenetrable, eternally existent, and susceptible of movement or change of relative position.

Matter in motion is held to be the fundamental constituent or ultimate fact of the universe; and all phenomena, including the phenomena of consciousness, are reduced by the theory to transformations of material molecules. As Paulsen points out, the reduction of psychical processes to physical is the special thesis of materialism.

The atomism of Leucippus and Democritus is the first formulation of a definitely materialistic system. It is true that in all the theories of the PRE-SOCRATICS (q.v.) the principle of explanation is materialistically conceived, but this is due to the fact that the contrast between matter and spirit had not yet been fully realized. Hence it is customary to apply the term HYLZOISM (q.v.) to the earliest Greek speculations. But even where the principle of explanation appears most abstract and idealistic, as in the Being of Parmenides, it is found on closer scrutiny that the definition of Being as 'a finite, spherical, motionless plenum' implies the unchallenged identification of being with sensible reality. Hence it has been argued by Burnet (cf. *Early Greek Philos.*, 192-5) that 'Parmenides is not, as some have said, the father of idealism; on the contrary, all materialism depends on his view of reality.' As a matter of fact, the atoms of Leucippus and Democritus correspond exactly to the Eleatic definition of Being. But Parmenides had brought philosophy to an *impasse* through the impossibility of deducing from his immovable one the phenomena of actual experience. The atomists solve this difficulty by placing Non-being or the void alongside of the Eleatic plenum, the latter conceived, however, not monistically, but pluralistically. 'Leucippus,' according

to Aristotle's account (*Gen. Corr.*, A. 8. 324 B, 35 ff.), 'thought he had a theory which was in harmony with sense-perception, and did not do away with coming into being and passing away, nor motion, nor the multiplicity of things. . . . For, said he, that which is, strictly speaking, real is an absolute plenum, but the plenum is not one. On the contrary, there are an infinite number of them, and they are invisible owing to the smallness of their bulk. They move in the void (for there is a void), and by their coming together they effect coming-into-being; by their separation, passing-away.' The atomists, as Lange says, were the first to fix the definition of matter and consciously to derive the totality of phenomena solely from matter so conceived. In the form given to it by Democritus, adopted (with a slight modification) by Epicurus and clothed in poetry by Lucretius, the materialistic theory undergoes little change in ancient times. Its characteristic features are (1) the reduction of all qualitative differences to quantitative, namely, to differences in the size, form, arrangement, and situation of the individual atoms, and (2) the denial of intelligent purpose or final cause. The origin of the world-structure from the clash of moving atoms is held to be fully explained by mechanical necessity (*ἀνάγκη*). Of the origin of motion no account is given: it is apparently considered as equally primordial with the existence of the atoms themselves. But the velocity of the atoms is made to depend on the size or mass of the atoms, whence arise those clashings and interferences which sift out the atoms of different kinds, and, by the separations and combinations produced, give rise in process of time to the existing cosmic system. Epicurus adopted the materialism and atomism of Democritus, but modified the principle of natural necessity by ascribing to the atoms (which he conceived as falling through infinite space) a power of voluntary deviation from the direct line of descent, explaining thereby the origin of the clashings and whirling movements from which the ordered system of things took its rise. The Stoics, as the great teleologists of the ancient world, with their pantheistic doctrine of the world-reason, stand at the opposite extreme from the pure atomism of the Epicureans; yet both schools are completely materialistic in their theoretical conceptions. The Stoics go so far as to declare that even the qualities, forces, and relations of things are 'bodies,' and the creative reason is con-

MATERIALISM

ceived (after Heraclitus) as a warm vital breath penetrating all things and constituting their active principle.

The materialism of Epicurus was revived at the beginning of modern philosophy by Gassendi, who, however, reconciled the theory with orthodox Catholicism by making God the creator of the atoms. About the same time Hobbes defined philosophy as the theory of body and motion, laying down explicitly that 'all that exists is body, all that occurs motion.' But philosophy is concerned, according to Hobbes, only with phenomena or things that appear as generated. Hence God, as ungenerated, is excluded from its scope, and philosophy (which is thus used as equivalent to natural science) has nothing to do with matters of faith. Hence, although Hobbes banishes final causes from philosophy, and gives a completely materialistic account of the relation of body and mind, he can hardly be classed as a materialist in the full philosophical sense of the word; he himself claimed to be an orthodox member of the Church of England. The anthropological materialism, which is so uncompromisingly taught by Hobbes, appears in several successive English thinkers, who combine it with a theistic or deistic theory of the universe as a whole. Even Locke, while holding that matter must have been created, and that it is in itself devoid of consciousness (and even perhaps of any active power), designedly leaves the immateriality of the soul an open question, 'it being, in respect of our notions, not much more remote from our comprehension to conceive that God can, if he pleases, superadd to matter a faculty of thinking than that he should superadd to it another substance with a faculty of thinking' (*Essay*, iv. 3, 6). Hartley's doctrine of association is expressed in terms of movements in the brain, and his disciple, Priestley, avowedly held the soul to be material, treating psychical phenomena as consisting literally in the material motions of the brain.

It was in France in the 18th century that the great modern development of philosophical materialism took place in the writings of Lamettrie and the ENCYCLOPÉDISTS (q.v.). Baron d'Holbach's *Système de la Nature*, published in 1770, represents the culmination of the movement. After the succession of idealistic systems in Germany in the end of the 18th and the beginning of the 19th century, materialism began, partly by way of reaction, to raise its head again about the middle of

the century. Moleschott, Vogt, and Büchner may be mentioned as leaders. Büchner's *Kraft und Stoff*, although crude and vague and of no real philosophical significance, is a fair type of the popular materialistic arguments and conclusions in the second half of the century, seeing that it has passed through sixteen or more editions since its publication in 1855, and has been translated into thirteen foreign languages. The concentration of mental energy on the problems of science, and the great advance of the biological sciences in particular, have given a materialistic colouring to much recent speculation that would decline to identify itself with dogmatic materialism. The agnosticism of Huxley and of Herbert Spencer might be instanced as acknowledging in theory the co-equal rights of mind and matter, but in practice laying the stress of explanation upon the material side. Materialism as a dogmatic system hardly survives in philosophical circles, although, in alliance with secularism and socialism, it is no doubt influential among certain sections of the working-classes, and often forms the creed of the half-educated specialist. The place of materialism has been taken by scientific MONISM (q.v.), which, however, in some of its representatives, seems often to be but slightly differentiated from the materialism which it has superseded.

'Ethical materialism' (Lange) and 'practical materialism' (Külpe) are terms used to denote the temper of mind which sees in the acquisition of wealth, material comfort, and sensuous pleasure the only reasonable objects of human endeavour. Lange, in his great work, considers dogmatic materialism to be impossible after the epistemological criticism of Kant, but regards it as a regulative principle of scientific inquiry. The chief epistemological, metaphysical, and scientific arguments against materialism (as well as the considerations on which it is based) are discussed by Lange and are summarized in Flint, Paulsen, and Külpe.

The term materialist is stated by Eucken (*Grundbegriffe der Gegenwart*, 97) to have been first used by Robert Boyle in his work on *The Excellence and Grounds of the Mechanical Philosophy*, 1674. Idealist and materialist appear frequently in Wolff as the two varieties of monist (monism being here opposed to dualism).

Literature: LANGE, *Hist. of Materialism* (Eng. trans.); FLINT, *Antitheistic Theories*, lects. ii-iv and notes 5-19; PAULSEN,

Einleitung in die Philos., 63-90; KÜLPE, Einleitung in die Philos., 127-37 (who distinguishes the different logical forms of materialisms). See also PAUL JANET, *Le Matér. contemporain* (6th ed.). Recent materialistic views in psychology are expounded by BALDWIN, *Recent Discussion in Materialism*, Presb. and Ref. Rev., i. (1890) 357. Cf. also the Encyclopedias, sub verbo; and BIBLIOG. B, 2, e. (A.S.P.P.)

Mathematical Economics: Ger. *mathematische Oekonomik*; Fr. *économie mathématique*; Ital. *economia matematica*. The development of notations and functions which serve to connect our experience with regard to balance of motives with our observation as to quantities of wealth; thus enabling the study of either set of phenomena to be used to explain the others quantitatively.

The differential equations of economics are mostly in terms of motive, the integrals mostly in terms of wealth.

The pioneer in mathematical economics was Cournot; his work has been extended by Dupuit and by Marshall. The efforts of v. Thünen were less permanently fruitful than those of Cournot. See SUPPLY AND DEMAND.

Another line of thought, first developed by Gossen, and afterwards (non-mathematically) by Menger, was made an instrument of powerful analysis by Jevons, and by the Austrian school after him (see MARGINAL INCREMENT). Among more recent mathematical economists we may note Anspitz and Lieben, Edgeworth, Fisher, and Pareto.

As Cohn well observes, mathematical methods in economics must not be confounded with statistical ones. The latter represent the extreme of concreteness, the former the extreme of abstraction. (A.T.H.)

Mathematical Logic: Ger. (1) *Logik der Mathematik*; Fr. (1) *logique des mathématiques*; Ital. (1) *logica della matematica*. (1) The logical analysis of mathematics. (C.S.P.)

(2) SYMBOLIC LOGIC (q. v.).

Literature (to 1): the logic of arithmetic is treated by DEDEKIND in his *Was sind und was sollen die Zahlen?* (Eng. trans. in *Essays on Number*, 1901). See also the ninth lecture of the third volume of SCHRÖDER, *Logik*; and FINE, *Number System of Algebra*. For the logic of the calculus, see the second edition of JORDAN, *Cours d'Analyse*; also CLIFFORD, *Theory of Metrics*, in his *Mathematical Papers*; WEBER, *Algebra*; and the papers of G. CANTOR, some of which are contained in the *Acta Mathematica*, ii, and subsequent ones in the

Mathematische Annalen, 15, 17, 20, 21, 23, 46, 49. LISTING's papers on topical geometry are two, one in the *Gött. Abhand.*, the other in the *Gött. Nachr.* Several of RIEMANN's papers are valuable in a logical point of view. See also CAUCHY, *Théorie des Clefs*. PETERSEN, *Methods and Theories*, shows how to solve problems in elementary geometry. Cf. MATHEMATICS. (C.S.P.)

Mathematics [Gr. *μαθηματική*, from *μαθήματα*, things learned]: Ger. *Mathematik*; Fr. *mathématiques*; Ital. *matematica*. A science of abstract relationships. These are by no means exclusively quantitative. The projective properties of curves, for instance, of which an example is given below, are purely positional. And the whole of analysis may be presented in the form of an abstract calculus of symbols to which no meaning of any kind need be assigned, the operations themselves being defined by certain formal laws, as addition by the laws $a+b=b+a$ and $(a+b)+c=a+(b+c)$. (J.M.B.-H.B.F.)

Any conception which is definitely and completely determined by means of a finite number of specifications, say by assigning a finite number of elements, is a mathematical conception. Mathematics has for its function to develop the consequences involved in the definitions of a group of mathematical conceptions' (Chrystal) combined with certain fundamental principles, or axioms and postulates. (C.L.F., F.F.)

One of the most distinctive characteristics of mathematics is the extreme definiteness of the conceptions with which it deals. They admit of exact definition by a limited number of marks.

The more fundamental of these conceptions correspond immediately to things and relations among things in the external world, from which, in fact, they have been derived by a process of abstraction. Such are the conceptions of cardinal numbers and of the ordinal arrangement of the cardinal numbers on which arithmetic is based (see NUMBER); the conceptions of point, line, &c., and of such fundamental relations as that two points determine a right line, &c., which lie at the basis of geometry.

It is the function of mathematics to make the simplest possible selection of such of these primary conceptions as are mutually independent, and by combining them and generalizing them, to create a body of more complex conceptions which have intrinsic interest and beauty and a value for the furtherance of the science itself or for the study of other

positive sciences. The extraordinary developments of the number-concept will serve as a familiar illustration of the extent to which the process of generalization is carried in mathematics.

For the investigation of these complex relationships, it must also invent an adequate symbolism.

It is customary to call those sciences 'mathematical' in which there exist, among the results of observation, certain fundamental relations so simple and definite that they can be represented with advantage by mathematical conceptions, and to denominate the disciplines which grow out of the mathematical discussion of these conceptions the 'applied mathematics.' Strictly speaking, geometry itself is a branch of the applied mathematics.

Very characteristic of the modern mathematics is the prominence of the notions: *manifoldnesses* or *assemblages* of actual or ideal elements of some kind, e.g. of points, lines, or surfaces; the *transformations* or *substitutions* by which the elements of two assemblages may be brought into definite relations of correspondence; and the *invariant properties* of assemblages, i.e. the properties which remain unchanged by given *groups of transformations*. In fact, to such an extent do these notions, in some form or other, underlie the various branches of mathematics, that it is almost admissible to define mathematics as the science of assemblages.

To cite one or two illustrations:—

(1) The simplest class of assemblages are finite groups of distinct things. The invariant property of such a group is its cardinal number—the property which remains unchanged by every 'transformation,' which merely changes the arrangement of the things in the group or replaces them, one for one, by other things.

(2) Every functional relation (see FUNCTION) between two variables y and x , say $y = x^2$, is a relation of correspondence between two number-assemblages—the values of x , on the one hand, and those of y on the other.

(3) In the study of a curve by the analytic method, we substitute for the curve itself the assemblage which consists of all the points upon it. The equation of the curve, $y = f(x)$, is merely a statement of the relation of correspondence into which this assemblage can be brought to another point assemblage—that which consists of all points on the x axis. And the equation $y = f(x)$

serves this purpose, because, before undertaking the study of the particular curve, we set up a definite relation of one-to-one correspondence between the assemblage of all the points of the plane and the assemblage of all possible pairs of real values of the variables x and y . Cf. IMAGING.

(4) We can transform an algebraic curve whose equation is $\phi(x, y) = 0$ into an endless variety of other curves by substituting for x and y , in the equation $\phi(x, y) = 0$, various functions of these variables.

But there is a group of such substitutions distinguished from all others by the fact that they leave invariant the 'order' of the curve $\phi(x, y) = 0$, that is, the greatest number of points in which it can be cut by a right line. This is the group of 'linear' substitutions, defined by all possible equations of the form

$$x = \frac{ax' + by' + c}{a''x' + b''y' + c''}, \quad y = \frac{a'x' + b'y' + c'}{a''x' + b''y' + c''}.$$

The curve has other properties which also remain invariant by this group of substitutions. Thus, if the equation $\phi(x, y) = 0$ be of the second degree, it will ordinarily represent a 'proper' conic, that is, an ellipse, hyperbola, or parabola; but it may also represent a pair of intersecting straight lines, which may be characterized as a conic possessing a 'singular point'—the point of intersection of the lines. The presence or absence of such a singular point in the conic $\phi(x, y) = 0$ is an invariative property of this curve with respect to the group of linear substitutions; that is, if $\phi(x, y) = 0$ be a proper conic, so will every conic be into which it can be transformed by a substitution of this group; if it be a pair of right lines, so will every conic be into which it can be transformed by a substitution of the group.

We may add that the properties of a curve which remain thus unchanged by linear transformation are called its 'projective' properties; those which do not, its 'metrical' properties.

Matriarchate [Lat. *mater*, Gr. *μήτηρ*, mother, + *ἀρχός*, leader, ruler]: Ger. *Mutterrecht*, *Matriarchat*; Fr. *matriarcat*; Ital. *matriarcato*. A family, clan, or tribe ruled by a woman or by women.

This term was introduced into ethnology by Backofen (*Das Mutterrecht*), and was adopted by E. B. Tylor and others. There is no proof that a matriarchate has ever existed, so-called matriarchal groups being probably merely METRONYMIC (q. v.). 'Children took the name of mothers. . . . This is really the origin of the so-called matriarchate, in which the mother had in fact no power, but gave her name to her child' (G. Bertin, *J. of the Anthropol. Inst.*, xviii. 271). (F.H.G.)

Matronymic: see METRONYMIC.

Matter: see EXTERNAL (different topics), BELIEF, EPISTEMOLOGY, PHILOSOPHY, and the following topics.

Matter (in physics) [Lat. *materia*, stuff]: Ger. *Materie*; Fr. *matière*; Ital. *materia*. The substance of which the sensible universe seems to us to be composed.

Its existence is manifested by an infinite variety of ever-changing phenomena, which we may consider as growing out of the direct or indirect action of matter upon our organs of sense. Thus, when we feel the object, we conceive it to act directly upon the nerves of sensation; when we see it, the action is that of light, and is therefore indirect. What differentiates matter from the phenomena or actions of which alone we are directly conscious is its permanence. The object which I call a chair presents itself to my senses in a great variety of more or less complex combinations, according to the point from which I view it or the way I touch it. If I leave the room in which it is placed, these phenomena cease entirely. From the fact that I can reproduce them at pleasure by going where the chair is—that by assuming the existence of the matter composing the chair as a reality, independent of my own existence, I can account in a very simple way for an infinitely complex series of experiences which could not be reduced to law in any other way—we have the strongest ground for our belief in the real existence of matter.

What attributes are we justified in assigning to this reality? We answer: those attributes which are necessary to account for the phenomena, and no others. Two associated attributes which are essential to our conception of matter are EXTENSION (q. v.) and IMPENETRABILITY (q. v.). Matter occupies space; two portions of matter cannot occupy the same position in space at the same time.

Such is our primary conception: but experience leads us to doubt whether these qualities are absolute. If we hold a lump

of sugar in water, we find that the water penetrates the sugar. We account for this by saying that the matter of the sugar is not a plenum; that there are unoccupied spaces between the particles, into which the water penetrates. But if we admit that the lump which seems to us a plenum—a continuous space-filling mass—is not such, where shall we stop? What space is really occupied by the ultimate parts of the mass?

This question gives rise to the hypothesis of Boscovich—that matter is composed of points endowed with inertia and certain powers of mutual attraction and repulsion. As two particles or atoms are brought closer, a distance is reached at which the mutual repulsion increases without limit as the distance is lessened, so that the two points cannot be brought into absolute coincidence by any amount of force.

This hypothesis is far from accounting for all the molecular phenomena of matter, cohesion, &c., but its elimination of extension and impenetrability as primary attributes is a distinctive step forward. To compare this and the natural conception, I hold a billiard ball in my hand. If I squeeze the ball, it resists. I conceive of the ball as filling a certain space, and passively resisting my effort to put my hand into the same space. But what I really feel, and all that I really feel, is a repulsive force between the matter of the ball and that of my hand. The latter presses the ball; by the law of action and reaction the ball equally presses the hand; the pressure is all that I feel, and pressure is only a force. How it happens that we posit a passive space-filling substratum when we feel only a force is an interesting question of genetic psychology; perhaps it is because the passive form of the conception is the easier one, and does not involve any use of the law of action and reaction. The vital point is that the attributes of impenetrability and extension become apparent or secondary ones.

Atoms. The ancient doctrine that matter is not infinitely divisible, but is composed of minute parts called atoms, which remain unchanged through all the chemical and physical processes to which matter can be subjected, seems to be justified by the great mass of facts which make up our chemistry and physics. The attributes of atoms are conceived of as, in themselves, invariable, though possibly subject to differences of manifestation under different surrounding conditions.

From this point of view every atom of the

same kind of matter, or of the same chemical element, must have the same mass. A series of numbers proportional to the masses of different kinds of atoms are called the *atomic weights*. For example, if we take the mass of an atom of hydrogen as unity, then that of an atom of oxygen will be about 8, of carbon about 6, &c. These numbers are only relative, since nothing is known of the absolute mass of any one atom. Cf. CHEMICAL SYNTHESIS. For the atom in philosophy, see MONAD.

Molecules. Most substances with which we are familiar are compounded of various elements: hence these smallest portions must be capable of subdivision into these elements, and therefore cannot be atoms. These smallest portions, portions which cannot be divided without changing the chemical properties of the compound, are called molecules. The distinction between an atom and a molecule is that the latter is subject to division, while the former is not.

Elements are the different kinds of matter which cannot be decomposed, and which therefore make up the substance of the material universe. From a purely logical point of view, the distinction between an element and a compound would seem to be relative to our knowledge at the moment. Possibly many of what we call elements are compounds which we have not succeeded in decomposing; and the idea that all matter may be of one kind, and all atoms be really molecules made up of different arrangements of one kind of *primaeval atoms*, has been widely entertained, and may be well founded. But it is a significant fact in this connection that no progress is being made in the way of decomposing the accepted elements. In no case has a substance accepted in our modern chemistry as an element been decomposed or transformed into another. The distinction between elements and compounds is therefore a real one in kind, whether, in the absolute sense, an atom is or is not a compound. (S.N.)

Matter and Form: Ger. *Materie* (*Stoff*) and *Form*; Fr. *la matière et la forme*; Ital. *materia e forma*. The word *matter* (Lat. *materia*, which was used to translate the Gr. *ἔλη*) is often employed where the more appropriate Greek word would be *σῶμα*, *corpus*, body; or *τὸ ὑποκείμενον*, *subiectum*, or even *ἡ ὑπόστασις*, translated *person* in theology. *Form* (Lat. *forma*, used to translate the Gr. *μορφή* and *εἶδος*, though the latter is more exactly represented by *species*) is often employed where *σχῆμα*, figure, or *τύπος*, shape, would be near equivalents. The Greek expressions *μορφή*,

παράδειγμα, *εἶδος*, *ιδέα*, τὸ τί ἐστί, τὸ τί ἦν εἶναι, are pretty nearly synonymous.

The distinction of matter and form was first made, apparently, by Aristotle. It almost involves his metaphysical doctrine; and as long as his reign lasted, it was dominant. Afterwards it was in disfavour; but Kant applied the terms, as he did many others drawn from the same source, to an analogous but widely different distinction. In many special phrases the Aristotelian and Kantian senses almost coalesce, in others they are quite disconnected. It will, therefore, be convenient to consider: (1) the Aristotelian distinction; (2) the Kantian distinction; and (3) special applications.

The Aristotelian distinction. Not only was the distinction originated by Aristotle, but one of the two conceptions, that of *matter*, is largely due to him. Indeed, it is perhaps true that the Greek word for matter in the sense of material, *ἔλη*, was never understood in that general sense before Aristotle came to Athens. For the first unquestionable cases of that meaning occur in certain dialogues of Plato, concerning which—though there are no dates that are not open to dispute—it seems to the present writer that it is as certain as any such fact in the history of Greek philosophy that the earliest of them was written about the time of Aristotle's arrival. It is true that, as Aristotle himself says, *matter* was the earliest philosophical conception. For the first Ionian philosophers directed their thoughts to the question what the world was made of. But the extreme vagueness of the notion with them is shown by their calling it *ἡ ἀρχή*, the beginning, by the nonsense of the question, and by many more special symptoms. If the philosophical conception of matter distinguished the metaphysics of Aristotle, that of Plato had been no less marked by its extraordinary development of the notion of form, to which the mixed morality and questioning spirit of Socrates had naturally led up; the morality, because the form is the complex of characters that a thing ought to have; the questioning, because it drew attention to the difference between those elements of truth which experience brutally forces upon us, and those of which reason persuades us, which latter make up the form. But Aristotle's distinction set form, as well as matter, in a new light.

It must not be forgotten that Aristotle was an Asclepiad, that is, that he belonged to a family which for generation after generation,

from prehistoric times, had had their attention turned to vital phenomena; and he is almost as remarkable for his capacity as a naturalist as he is for his incapacity in physics and mathematics. He must have had prominently before his mind the fact that all eggs are very much alike, and all seeds are very much alike, while the animals that grow out of the one, the plants that grow out of the other, are as different as possible. Accordingly, his *dunamis* is germinal being, not amounting to existence; while his *entelechy* is the perfect thing that ought to grow out of that germ. Matter, which he associates with stuff, timber, metal, is that undifferentiated element of a thing which it must possess to have even germinal being. Since matter is, in itself, indeterminate, it is also in itself unknowable; but it is both determinable by form and knowable, even sensible, through form. The notion that the form can antecede matter is, to Aristotle, perfectly ridiculous. It is the result of the development of matter. He looks upon the problem from the point of view of a naturalist. In particular, the soul is an outgrowth of the body.

The scholastics, who regarded Aristotle as all but infallible, yet to whom the ideas of a naturalist were utterly foreign, who were thoroughly theological in their notions, admitted that the soul was a form. But then, they had great difficulty with those opinions of their master which depended upon his conceiving of matter as more primitive than form. Their notions of form were rather allied to those of Plato. The mode of being that, in some sense, anteceded individual existence, they would have held to be one in which there was form without matter, if awe of Aristotle had not caused them to modify the proposition in one way or another. A question, for example, which exercised them greatly was, how the form was restricted to individual existence? For Aristotle there could not be any such question, because he did not conceive of a form taking on individuality, but of an undifferentiated matter taking on, or rather developing, form, and individuality, perhaps, with it (412 a, 7).

The Kantian distinction. Aristotle refuses to consider any proposition as *science* which is not universal. He does not go so far as to say that all knowledge involves synthesis, but he often approaches doing so. In particular, he holds that matter is something in itself beyond our knowledge, but the existence of which has to be assumed in order to

synthetize the opposites that are involved in all change. He expressly defines that as the function of the conception of matter. With Kant, the view that all knowledge involves synthesis—various acts of synthesis one over another—is vastly more developed; and he, too, employs the terms *matter* and *form* as called for by such synthesis. But it is curious that while with Aristotle it is matter that is the quasi-hypothesis imported into the facts that the mind may synthetize, with Kant, on the other hand, it is form which performs this function. The matter of cognition consists of those elements which are brutally and severally forced upon us by experience. By the form he means the rational or intelligible elements of cognition, which he wishes, as far as possible, to regard as independent contributions of the mind itself, which we have no right to suppose are duplicated by anything corresponding to them in the thing. For the Aristotelian, all pure matter is exactly alike, equally devoid of all predicates, while the forms make all the variety of the universe. For the Kantian, on the other hand, matter is the manifold, while the pure forms are the few different modes of unity. Nevertheless, the Kantians—indeed, Kant himself (see the *Critic of the Pure Reason*, 1st ed., 266)—argued that they were using the terms in their old and accepted sense. What enabled them to give some speciousness to their contention was the circumstance that during the full century and more of neglect of the Aristotelian doctrine that had intervened, certain secondary senses of the term *matter*, especially that of corporeal matter, and that of a species of corporeal matter, had become relatively prominent.

Special senses. Although there is only one *first* or *primary* matter, absolutely indeterminate, yet Aristotle often uses the term in a modified sense so that which is relatively indeterminate; so that the *last* or *second* matter is the same as the form. But these phrases are also used in quite other senses, which need not here be specially noticed. Matter being taken relatively, the same thing can have this or that as its matter in different respects; and so matter is distinguished into *materia ex qua*, *in qua*, and *circa quam*. *Materia ex qua* is the material; silver is the *materia ex qua* of a dime. *Materia in qua* is the subject in which the form inheres; *materia circa quam* is the object. Aquinas illustrates the distinction by virtue, which is a form, and, as such, has no *materia ex qua*; but it

has a subject in which it inheres and an object upon which it is exercised. Aquinas introduced the term *signate matter*. Matter of composition, or *proximate matter*, is that of which a thing consists; matter of generation, or *remote matter*, that from which it is developed, as a seed or egg.

The varieties of form are so numerous that they may best be taken in alphabetical order.

Absolute form: form abstracted from matter.

Accidental form: an accident, or that the presence of which constitutes an accident; as music is the accidental form of the musician.

Advenient form: a form subsequent to the final form.

Apprehended form = apprehended SPECIES (q. v.).

Artificial form: a form superinduced by art.

Assistant form: an agent aiding in the realization of a form, especially of that whose essential character is to move; as the angel who turns the heavens round once every twenty-four hours, or the captain of a ship.

Astral form. According to Gilbert (*De Magnete*), phenomena of electricity are produced by a material effluvium, while the action of a magnet takes place directly at a distance. Whatever it may be then which constitutes the magnetic field, not being matter, must be called form. Gilbert names it *forma prima radicalis et astralis*.

Common form: a form belonging to a species.

Completive form: used by Aquinas in the sense of the last of the series of forms which gradually bring a thing to fully developed existence. By Aristotle called *last form*.

Composite form: the form of a collective whole, so far as it is different from its parts.

Corporeal form: a form of a corporeal nature. This is used by Aquinas, *Summa Theol.*, pars I. qu. lxxv. art. 4. See *Material form*.

Disponent form: a form rendering matter apt to receive another, *principal*, form. Thus, dryness in wood disposes it to receive combustibility.

Elementary form: one of the four combinations of hot and cold with moist and dry which were supposed to characterize the four elements.

Exemplar form: an idea.

Final form: see *Completive form*.

General form: the form of a genus; as we should now say a *generic form*.

Immaterial form: a form which neither depends upon matter while it is being made nor after it is made; a term employed in the theological doctrine of creation.

Incorruptible form: a form not subject to corruption.

Individual form: in one of the theories of individuation, was a form which by existing in matter acquired the power of individuating another form.

Informant form: a form which is a part of the thing of which it is the form.

Inherent form: a form which can only exist in a state of inherence in matter.

Intellective form: the mind as form.

Intelligible form: see *Sensible form*.

Intermediate form: a form having a middle position between an elementary and a completive form.

Material form: a term of Scotus, who defines it as follows: 'Formam materialem dico esse omnem illam, quae ex natura sua necessario inclinatur naturaliter, ut sit actus materiae, sive sit substantialis, sive accidentalis' (*Op. Oxon.*, IV. i. 1); 'Ideo dici potest tertio modo.' But elsewhere (ibid., I Post. qu. ii.) he distinguishes two senses of the term: 'Forma materialis potest intelligi dupliciter. Uno modo dicitur, quae educitur de potentia materiae, vel quia utitur organo corporeo in operando: et isto modo forma intellectiva non est forma materialis. Alio modo dicitur forma materialis, quia perfectio materiae, et isto modo anima intellectiva est forma materialis, ideo aliquam variationem potest accipere a materia, quam perficit, quia ex materia et forma fit vere unum.' Perhaps the most accessible book from which to gain a hint of the nature of the difficulty which gives rise to this distinction is Bridges' edition of what is called *The Opus Majus of Roger Bacon*, ii. 507-11, cap. ii.

Mathematical form: an object of mathematical contemplation, and the result of mathematical abstraction.

Metaphysical form: form in the philosophical sense.

Native or natural form, *forma in natura existens*, *forma naturae*, *form of a nature*, is a term going back to John of Salisbury (*Opera*, ed. Giles, v. 92), and closely connected, if not synonymous, with *material form*. Certain questions started by Aristotle in Book V of the *Metaphysics* (of which there is an admirable periphrastic translation by Grote, *Aristotle*, 2nd ed., 619 ff.) gave rise to discussions in which the doctrine was compared with Christian beliefs; and the *natural form* plays a considerable part in such discussions.

Bacon adopted the term *forma naturae*. He did not grossly depart from the received

meaning of the term, but owing to his occupying himself with inquiries quite antipodal to those of the scholastics, the two parties did not understand one another. Bacon means the physical explanation of a phenomenon, its occult *modus operandi*. Among the followers of Bacon we, at first, hear a great deal about forms. Boyle wrote whole books about them. But the distinction of matter and form was not calculated to further such inquiries as theirs. It is adapted to expressing phenomena of life. It might be twisted to such a purpose as Gilbert put it to (see *Astral form*), but it was not suited to the mechanical philosophy of Boyle, and only led to wordy and fruitless discussions.

Participate form: a form considered as it is united with matter.

Preparatory form: a term used by Boyle where *disponent* form would be more technical. He says, 'The preparatory form is but (if I may so speak) a harbinger that disposes the matter to receive a more perfect form, which, if it be not to be succeeded by any other more noble, is entitled the specific form of that body; as in the embryo, the vegetative and the sensitive soul is but preparatory to the rational, which alone is said to be the specific form of man' (*Free Considerations about Subordinate Forms*).

Physical form: such forms as may form the object of physical inquiries. Of course, the term was very differently understood during scholastic times and in the 17th century. But the above definition covers both uses.

Primary form. There is no such well-recognized term of metaphysics; but a remark of William Gilbert leads us to suppose that medical men attached some meaning to it.

Principal form is that which *per se* constitutes a species. Called also *specific form*.

Radical form: see *Astral form*.

Sensible form. Though it chances that Aristotle nowhere distinguishes *μορφή* into *αἰσθητή* and *νοητή*, yet his followers did. Sensible forms are those which the outward senses distinguish; intelligible are those which the intellect alone can distinguish.

Significate form: a Thomistic term, a form distinguished by a name.

Simple form: form without matter. 'Forma simplex, quae est purus actus, est solus deus,' says St. Thomas.

Specific form: see *Principal form*.

Subsistent form: a form capable of existing separate from matter, as Aquinas holds that the angels and departed spirits are.

Substantial form: a form which constitutes a *nature*, i.e. a species or genus. Thus, the accidental form of a musician is music; but his substantial form is the rational soul which makes him a man. When men's thoughts became turned from theology to the investigation of physics, those who were animated by the new spirit found themselves confronted with objections based upon allegations of substantial forms. That these substantial forms, so used, were merely a hindrance to the progress of science, was quite plain to them. But the objections were urged with a logical accuracy, born of centuries of study, with which the new men were utterly incapable of coping. Their proper course would have been quietly to pursue their own inquiries, and leave the theologians to square their results with philosophy as best they could. But circumstances did not permit this. The theologians had the popular intelligence and the arm of power on their side; and when an apparent opposition arose, they naturally exerted themselves to put it down. Thus, the innovators were led to protest against these senseless and harmful substantial forms; and they had to formulate their objections to them—a business for which they were entirely unfitted. But since the discoveries of the physicists were plainly adding to man's knowledge and power, while their antagonists were simply obstructive, the former soon carried the day in the general opinion of mankind. The history proves that there was something vicious about the theological application of *substantial forms*; but it in no degree goes to show that the physicists accurately defined the objection to that application. In reviewing the arguments at the present day, when the position of the mechanical philosophers is becoming almost as obsolete as that of the scholastic doctors, we first note that when the new men denied that the substantial forms were 'entities,' what they really had in mind was, that those forms had not such a mode of being as would confer upon them the power dynamical to react upon things. The Scotists, for it was they upon whom, as being in possession of the universities, the brunt of the battle fell, had in fact never called the substantial forms 'entities,' a word sounding like a Scotistic term, but in fact the mere caricature of such a term. But had they used the word, nothing more innocent than the only meaning it could bear for them could be imagined. To call a form an 'entity' could hardly mean more

than to call it an abstraction. If the distinction of matter and form could have any value at all, it was the substantial forms that were, properly speaking, forms. If the Scotists could really specify any natural class, say man—and physics was at that time in no condition to raise any just doubt upon that score—then they were perfectly justified in giving a name to the intelligible characteristic of that class, and that was all the substantial form made any pretension to being. But the Scotists were guilty of two faults. The first—great enough, certainly, but relatively inconsiderable—was often referred to, though not distinctly analysed and brought home to them. It was that they were utterly uncritical in accepting classes as natural, and seemed to think that ordinary language was a sufficient guarantee in the matter. Their other and principal fault, which may with justice be called a sin, since it involved a certain moral delinquency, was that they set up their idle logical distinctions as precluding all physical inquiry. The physicists and Scotists, being intent upon widely discrepant purposes, could not understand one another. There was a tolerably good excuse for the physicist, since the intention of the Scotist was of an abstract and technical kind, not easily understood. But there was no other excuse for the Scotist than that he was so drugged with his metaphysics that ordinary human needs had lost all appeal to him. All through the 18th century and a large part of the 19th, exclamations against the monstrousness of the scholastic dogma that substantial forms were entities continued to be part of the stock-in-trade of metaphysicians, and it accorded with the prevalent nominalism. But nowadays, when it is clearly seen that physical science gives its assent much more to scholastic realism (limited closely to its formal statement) than it does to nominalism, a view of the history more like that here put forward is beginning to prevail.

In the following terms, mostly Kantian, prepositional phrases express the qualifications.

Form of corporeity: a very common term of scholasticism, originating with Avicenna, and used by Aquinas (*Summa Theol.*, pars i. cap. lxxvi. art. 2), but more particularly by Scotus (in his great discussion *Opus Oxon.*, IV. dist. xi. 9. 3, beginning ‘De secundo articulo dico’) and by all his followers. The point is, that the rational soul, being purely spiritual, cannot confer corporeity upon the human body,

but a special form, the form of corporeity, is requisite. Suarez and others, generally Thomists, as well as Henry of Ghent, denied this on the ground that a species has but one form. Thus a great metaphysical dispute arose. It sprung from the study of the doctrine of transubstantiation. See Cavellus, *Suppl. ad quaest. Scoti in De Anima*, disp. i, which is in the Lyons ed. of Scotus, tom. ii.

Form of cognition, in Kant's doctrine, is that element of knowledge which the matter of experience must assume in order to be apprehended by the mind. Kant seems to have been thinking of legal forms which must be complied with in order to give standing before a court. So an English sovereign, in order to be crowned, must, as a ‘matter of form,’ swear to an intensity of loathing for Romish dogmas which he probably regards with great coolness. Kant's definitions are chiefly the following:—

‘In the phenomenon, that which corresponds to the impression of sense, I call the matter of it; while that which constitutes the fact that manifoldness of the phenomenon is intuited as ordered in certain relations, I call the form of the phenomenon’ (*Krit. d. reinen Vernunft*, 1st ed., 20).

‘All cognition requires a concept, be it as imperfect and dark as you will; and this, in respect to its form, is always a universal which serves as a rule’ (*ibid.*, 106).

‘The transcendental unity of the synthesis of the imagination is the pure form of all possible cognition, through which, consequently, all objects of possible experience must *a priori* be represented’ (*ibid.*, 118).

‘There are two factors in cognition; first, the concept by which any object is thought—that is, the category; and secondly, the intuition by which that object is given. For if the concept had had no corresponding intuition, it would be a thought, no doubt, as far as its form goes; but having no object, no cognition whatsoever [he means, whether true or false] of anything would be possible by it; since, so far as I should know, there would be nothing, and perhaps could be nothing, to which such a concept would be applicable’ (2nd ed. of the *Deduction of the Categories*, § 22).

‘It is not more surprising that the laws of phenomena in nature must agree with the understanding and its *a priori* form, i.e. with its power of combining any manifold, than that the phenomena themselves must agree with the *a priori* form of sensuous intuition.

For just as phenomena have no existence in themselves, but are merely relative to the mind, as having senses, so laws do not exist in the phenomena, but are merely relative to the mind in which the phenomena inhere, that mind exercising understanding' (and see the rest of this passage, *ibid.*, § 26).

Form of forms. Francis Bacon says 'the soul may be called the form of forms,' which would be a pretty conceit, were it not plagiarized from the serious doctrine of Aristotle: ὁ νοῦς εἶδος εἰδῶν (432 a, 2).

The terms *matter* and *form* are used in certain peculiar ways in logic. Speaking *materialiter*, the matter of a proposition is said to be its subject and predicate, while the copula is its form. But speaking *formaliter*, the matter of a proposition is, as we familiarly say, the 'matter of fact' to which the proposition relates; or as defined by the scholastics, 'habitus extremorum adinvicem.' The second tractate of the *Summulae* of Petrus Hispanus begins with the words: 'Propositionum triplex est materia; scilicet, naturalis, contingens, et remota. Naturalis est illa in qua praedicatum essentia subiecti vel proprium eius; ut, homo est animal; vel, homo est risibilis. Contingens est illa in qua praedicatum potest adesse et abesse subiecto praeter subiecti corruptionem; ut, homo est albus, homo non est albus. Remota est illa in qua praedicatum non potest convenire cum subiecto; ut, homo est asinus.'

Of a syllogism, the proximate matter is the three propositions; the remote, the three terms. The form, which ought to be the *ergo*, by the same right by which the copula is recognized as the form of the proposition, is said to be 'apta trium propositionum dispositio ad conclusionem ex praemissis necessario colligendam.' But Kant, in the *Logik* by Jäsche, § 59, makes the premises the matter, and the conclusion the form. (C.S.P.)

Maxim (in ethics) [Lat. *maxima sententia*, opinion of greatest weight]: Ger. *Maxime*; Fr. *maxime*; Ital. *massima*. (1) Any important principle for the regulation of conduct.

(2) A technical term in Kant's ethics: a practical principle regarded by the agent as valid for his own will.

In this latter sense a maxim is distinguished from a practical law. The latter is regarded as objectively valid, or valid for the will of every rational being. Morality consists, according to Kant, in the objective law becoming also the subjective maxim of the will; and his moral imperative is accordingly ex-

pressed in the terms, 'Act so that the maxim of thy will can always at the same time hold good as a principle of universal legislation.' Cf. Kant, *Krit. d. prakt. Vernunft*, Pt. I. Bk. II. chap. i. §§ 1 and 7. (W.R.S.)

Maxim (in logic). A widely received general assertion or rule.

The earliest writers, so far as has been shown, to use *maxima* as a substantive were Albertus Magnus and Petrus Hispanus. The former (*Post. Anal.*, lib. I. cap. ii) makes *maximae* constitute the seventh of thirteen classes of propositions which may be accepted, though they are uncertain, so that they differ widely from *dignitates*, or axioms. He says, 'Maximae propositiones opinantur esse quae non recipiuntur nisi in quantum sunt manifestae. Et putat vulgus commune et alii simplices et non periti quod sint primae ex sui veritate communicantes omnem intellectum; sicut est ista propositio, Mendacium est turpe,' &c. Hamilton quotes, but gives an unverifiable reference to, a sentence in which Albertus makes *maxima* another name for a *dignitas*. Petrus Hispanus (*Summulae*, v) says, 'Maxima est propositio qua non est altera prior neque notior'; and he divides commonplaces into two kinds, called Maxim and Difference of Maxim. This phraseology was so generally followed that it is surprising that Prantl's attribution of it to Albert of Saxony (who simply copies the *Summulae* here, almost verbatim) should have found any acceptance. Blundevile and other early writers of logic in English take the word from the *Summulae*. It was also adopted into English law. The meaning now tends to return to that used by Albertus. Kant (*Krit. d. reinen Vernunft*, 1st ed., 666) defines a maxim of reason as a subjective principle derived not from the character of the object, but from the interest of reason in such perfection of cognition as may be possible; and in the *Critic of the Practical Reason* he endeavours to make out something analogous in that sphere. In the *Logik* by Jäsche (Einleitung III) he defines a maxim as an inward principle of choice between different ends. (C.S.P.)

Maxim (legal): Ger. *Rechtsregel*, *Grundsatz*; Fr. *maxime de droit*; Ital. *massima giuridica*. The sententious expression of an established rule of law in a short form, which has become authoritative by long use and general approval; a legal axiom. Such a maxim has the force of law, e.g. 'Causa proxima, non remota, spectatur.'

The use of maxims is common to all

systems of jurisprudence. The leading collection is the title of the Digest of Justinian, *De diversis regulis iuris antiqui*, L. 17. See Phillimore's *Principles and Maxims of Jurisprudence*; Brown's *Maxims of English Law*; and Bouvier's *Law Dict.*, sub verbo. The latter contains about 1000 maxims, of which, say, 100 are in daily use in English and American courts. (S.E.B.)

Me: see I AND ME, and SELF.

Mean (1) and (2) **Median** [Lat. *medius*, middle, through Fr.]: Ger. (1) *Durchschnitt*, (2) *Mitte*; Fr. (1) *moyenne*, (2) not in use; Ital. (1) (*quantità*) *media*, (2) (*valore*) *mediano*. (1) When the term mean is used without qualification, it signifies the sum of a series of quantities divided by their number: the arithmetical mean, or average. Other kinds of mean are used, of which the geometrical mean is the most common. This is the square root of the product of two quantities.

The mean may be a representative quantity, as when it is found that the mean height of a certain class of men is 175 cm.; or it may be an approximation to a true value, as when it is found as the result of a number of measurements that the height of a man is 175.1 cm. The term average may with advantage be used for a representative value, and the term mean be confined to the precise mean.

(2) The median is the value midway in a series. In a large number of measurements following the distribution of the law of probabilities the median would coincide with the arithmetical mean. If, however, there are extreme values in one direction—as in the reaction-time where long times may occur, but times departing to the same amount from the mean in the opposite direction cannot occur—it may be an advantage to use the median. The median can also be used with qualitative differences, as the vividness of mental imagery or students' papers in an examination. Galton has used the median to advantage in such cases, the different degrees being divided into ten or four groups (deciles or quartiles). (J.M.^cK.C.)

Galton defines the median: 'The accepted term to express the value that occupies the middlemost position. . . . The median *M* has

three properties. The first, that the chance is an equal one of any previously unknown measure in the group exceeding or falling short of *M*. The second is, that the most probable value of any previously unknown measure in the group is *M*. Thus, if *N* be any one of the measures and *u* be the value of the unit in which the measure is recorded, such as an inch, &c., then the number of measures that fall between $(N - \frac{1}{2}u)$ and $(N + \frac{1}{2}u)$ is greatest when $N = M$. Mediocrity is always the commonest condition. . . . The third property is that whenever the curve of the scheme is symmetrically disposed on either side of *M*, except that one half of it is turned upwards and the other half downwards, then *M* is identical with the ordinary arithmetic mean or average' (Galton, *Natural Inheritance*, 41, which may be consulted also for mean and cognate conceptions). See MID-, and cf. ERRORS OF OBSERVATION. (J.M.B.)

Mean (in ethics) [Gr. equiv. *μεσότης*]: Ger. (*rechte*) *Mitte*; Fr. (*juste*) *milieu*; Ital. *mezzo*. That intermediate condition, removed alike from excess and from defect, which has been held to characterize virtuous or moral activity.

This conception occupies a central place in Aristotle's doctrine of virtue; but, in giving it that place, Aristotle only defined and rendered exact a conception which had become traditional. Greek views of life and art were from early times ruled by the conception of measure; the praise of moderation is found in Homer, and is a commonplace of the Seven Sages. Numerical definiteness was given to the same conception by Pythagoras, who seems to have identified the infinite or unmeasured with evil. In the *Politicus*, and still more prominently in the *Philebus* of Plato, the conception of measure is of fundamental importance, so that (as Sir A. Grant says) 'words like *μετρίότης* and *συμμετρία* became naturally appropriated to express excellence in life and action.'

Through his conception of the mean Aristotle attempts to define the due moderation in which virtuous activity consists. But his conception is not merely quantitative. It is not the absolute or arithmetical mean (*μέσος τοῦ πράγματος*). This latter (which, as between two quantities, is equal to half their sum) has no place in morals. Virtuous action is a mean 'relative to us' or to the agent—*τὸ μέσον τὸ πρὸς ἡμᾶς*. It is not determined merely by abstract considerations, but is similar in character to the perfect harmony displayed in a work of art. Every morally

virtuous habit or action is a mean between opposed extremes (which are vicious); but its distance from these extremes is not a matter of arithmetic, but is relative to a man's nature, and is determined rationally in accordance with the judgment of the man of moral insight (*φρόνιμος*). Further, Aristotle himself asserts that while the doctrine of the mean expresses the law of virtue, yet viewed in relation to the good, virtue is altogether opposed to vice, and is therefore, in this sense, an extreme. The doctrine of the mean—*le juste milieu*, 'the golden mean' as it has been called—may thus be said to express the aesthetic aspect of virtue or goodness. Aristotle's own statements might have guarded him from the misinterpretation to which Kant gave currency in saying that Aristotle made only a quantitative distinction between virtue and vice.

(W.R.S.)

Mean Error: see ERRORS OF OBSERVATION, and PSYCHOPHYSICAL METHODS.

Mean Gradation (method of): see PSYCHOPHYSICAL METHODS.

Mean Variation: see ERRORS OF OBSERVATION. Cf. also PROBABILITY, and VARIATION (statistical treatment of).

Meaning [Gothic *munan*, Ger. *meinen*, to think]: Ger. *Sinn*, *Meinung* (OPINION, q.v.); Fr. *sens*; Ital. *senso*. A NOTION (q.v., sense 1) considered as having more remote bearings and relationships necessary to its adequacy, yet without abstracting from the image (see NOTION, sense 2) and without reference to the conative value of the notion (cf. INTENT). See TERMINOLOGY, English, 'Meaning,' for a further note on the foreign equivalents.

(J.M.B., G.F.S.)

Meaning (in logic and grammar): see SIGNIFICATION, and UNIVERSE (in logic). Cf. SEMANTICS, and SIGNIFICS.

Meaning (in philosophy): see WORTH.

Means (to ends): Ger. *Mittel*; Fr. *moyens*; Ital. *mezzi* (*al fine*). Those end-states of voluntary determination which enter as elements into the voluntary determination of a larger end-state or terminus.

The phrase 'means to an end' denotes the psychological fact that while consciousness is pursuing the means, it is as elements in a larger whole which consciousness is also pursuing. Cf. END-STATE, and TERMINUS.

(J.M.B., G.F.S.)

Measure of Precision: see ERRORS OF OBSERVATION.

Measurement [Lat. *mensura*, a measure]: Ger. *Messung*; Fr. *mesure*; Ital. *misura*—

zione. The determination of a magnitude in terms of a standard unit. Cf. UNITS OF MEASUREMENT, and NUMBER (concept of).

Exact science consists of measurements, and all sciences as they advance become increasingly quantitative. The fundamental UNITS (q.v.) of physical science are of space (size and direction), of time, and of mass (or energy). Counting is sometimes regarded as a kind of measurement, and a ratio is the basis of all measurement. The place of measurement in psychology is still an open question. Kant held that only the time of mental processes could be measured. Fechner attempted to measure their intensity, and more recently their extensity has been regarded as measurable. Could psychology measure these three magnitudes and count (i.e. collect statistics), it would have the same field for quantitative research as physical science. It has been claimed that only physical measurements are made in the psychological laboratory, but it may be replied that at all events mental processes are functions of the quantities measured.

These cases may be taken as illustrative of the following general principles:—

(1) That which is the subject of measurement is not a concrete object, but an attribute or condition associated with the object.

(2) This attribute or condition must depend upon some cause or agency susceptible of division into like parts which can, without ambiguity, be added to each other.

(3) The attribute or condition must be capable of definition without leaving any doubt as to the method by which it is to be measured. Otherwise, different modes of measurement may lead to different and inconsistent results.

Literature: WUNDT, *Logik*, IV. Absch., I. Cap. (2nd ed.); VENN, *Empirical Logic*; JEVONS, *Princ. of Sci.*; EVERETT, *Units and Physical Constants*.

(J.M.C.K.C.)

Measurement (principles of). The definitions of a concept *qua* object and *qua* magnitude or mathematical quantity should be sharply distinguished, and much confusion has arisen through assuming that the definition of a concept must include the definition of its measure as a quantity.

For example, the definition of a line is distinct from that of the word length, which expresses the magnitude of the line. Euclid defines a triangle in such a way as to imply that its measure is its area, when, in fact, the perimeter might equally be taken as the

measure. A bar of iron may be measured by its mass, its volume, or its length. Which measure we shall take is logically a matter of arbitrary definition, and, practically, a question of convenience. The measurements of temperatures by two thermometers of different materials cannot be brought into agreement through the entire range of observable temperatures. It is therefore desirable, in using any concept as a quantity, always to indicate what the nature of the quantity is, as lines of equal length, triangles of equal area, instead of equal lines and triangles.

In order that a concept may be measured as a mathematical quantity without ambiguity, it is essential that the special attribute by which we measure it should be conceivable as made up of discrete parts, admitting of unambiguous comparison *inter se*, with respect to their equality or difference of magnitude. The simplest case is that of a straight line, whose length we conceive to be made up of distinct metres, centimetres, millimetres, or other units taken at pleasure, each of which can be determined by bringing it into coincidence with a movable measure of the designated length. Quantities of heat may be measured on the same system. But such is not the case with increments of temperature. Were it a universal rule that equal quantities of heat produce proportionate increments of temperature in all bodies, there would be no difficulty in measuring temperature by quantities of heat. But such is not the case, so that the absolute equality of increments of temperature has to be defined by thermodynamic considerations.

A more complex, but very instructive case, showing how the relation of equality between magnitudes is a matter of definition, is afforded by light, or, as the writer prefers to call it, radiance in general, whether visible as light or not. The intensity of a homogeneous ray emanating from a point and falling on an eye is capable of unambiguous definition, because equal quantities of radiance may be added without limit. Still, the measure will be definite only for a given eye at a given distance with a fixed opening of the pupil. If the distance increases, the apparent intensity of the radiance diminishes; it will be different with different eyes; it will vary with the diameter of the pupil of the same eye.

Radiance may be measured by two effects: effect on the eye, and quantity of energy conveyed by the ray. These will give ac-

cordant results in the case of any one homogeneous ray. But if rays of different wave length be compared, equality of optical effect will not correspond to equal quantities of energy. (S.N.)

Measurement Formula (psychophysical): see FECHNER'S LAW.

Mechanical [Gr. *μηχανή*, a machine]: Ger. *mechanisch*; Fr. *mécanique*; Ital. *meccanico*. A term used, in antithesis to organic and teleological, to describe any theory which proposes to eliminate final causes from philosophy, and to explain all phenomena as the necessary outcome of the general laws of matter in motion; and also applied to the world as thus explained. That which is strictly mechanical is called a machine or a mechanism. (A.S.P.P.—J.M.B.)

The term is used by Aristotle, and maintained itself during the middle ages, but the philosophical opposition between a mechanical and an organic or teleological view of the universe associates itself with the term only in modern times. Descartes' saying, 'Give me matter, and I will construct the world'—including in the world the phenomena of life, everything, indeed, except the *res cogitans* in man—formulated the protest of modern science against the 'forms' and inner powers of scholasticism. Boyle, one of the most enthusiastic apostles of 'the new philosophy,' expressly uses the term mechanical to describe the new view (cf. his treatise on *The Excellence and Grounds of the Mechanical Philosophy*). It is freely used in the same reference by Berkeley in *Siris*, who maintains, however, that 'the mechanical philosopher inquires properly concerning the rules and methods of operation alone, and not concerning the cause; forasmuch as nothing mechanical is, or really can be, a cause' (*Siris*, § 249; cf. §§ 236, 247). Boyle himself did not deny that the mechanical philosophy required to be supplemented by 'an inquiry into the final causes of natural things.' But Spinoza, in his passionate polemic against the idea of end, uses the term mechanical to denote the true and complete explanation as opposed to explanation by means of supernatural or miraculous agency. It is significant that the example he takes is the frame of the human body, which has furnished so many 'arguments from design.' The common run of thinkers, he says, 'ubi corporis humani fabricam vident, stupescunt, et ex eo, quod tantæ artis causas ignorant, concludunt eandem non mechanica sed divina vel supernaturali arte fabricari, talique modo

constitui ut una pars alteram non laedat' (*Ethica*, i, Appendix). Leibnitz's philosophy is a systematic attempt to give free scope to the scientific demand for mechanical causation, and at the same time to do justice to the philosophical demand for teleological explanation which Aristotle and the older philosophy had striven to satisfy. *Causae efficientes pendentes a finalibus* may be taken as the motto of his thinking. In a not dissimilar spirit, Kant distinguishes between the mechanical causality which governs nature or the world of phenomena, and the free ethical causality of 'the realm of ends' of which man's reason and will constitute him a citizen; while Lotze declares, in the spirit of Leibnitz, that the aim of his philosophizing is 'to show how absolutely universal is the range of mechanism, and at the same time how completely subordinate the significance of the function which it has to fulfil in the structure of the world' (Intro. to the *Microcosmus*). Cf. the discussion of the supposed antithesis between natural selection, as mechanical, and teleology given under HEREDITY, and see NATURALISM (1).

In biology: mechanism is opposed to vitalism, and in more recent controversy to neovitalism, as in the term DEVELOPMENTAL MECHANICS (q. v.), in which morphological changes are treated from the strict point of view of cause and effect.

Literature: EUCKEN, *Gesch. u. Krit. d. Grundbegriffe d. Gegenwart*; JANET, *Final Causes*; TRENDLENBURG, *Hist. Beitr.*, ii, *Ueber den letzten Unterschied der philosophischen Systeme*; WARD, *Naturalism and Agnosticism*. (A.S.P.P.)

Mechanical Equivalent (of heat): Ger. *mechanisches Aequivalent*; Fr. *équivalent mécanique*; Ital. *equivalente meccanico*. The amount of mechanical work that must be expended in order to produce a unit of heat; generally the amount of energy which, by its disappearance, will create a unit of heat.

The equivalent is commonly expressed in terms of WORK (q. v.), the most convenient method of determination. See also ENERGY. (S.N.)

Mechanics [Gr. *μηχανικός*, pertaining to mechanics]: Ger. *Mechanik*; Fr. *mécanique*; Ital. *meccanica*. The science which treats of the effects of force in causing motion or equilibrium.

Theoretical mechanics: the science of mechanics treated in a general way, solely with regard to the principles involved.

Applied mechanics: the application of the

laws of mechanics to practical purposes, such as the strength of materials and the working of machinery. See also MECHANICAL. (S.N.)

Mechanics of Ideas: see MECHANISM (of mind), and HERBARTIANISM.

Mechanism: see MECHANICAL.

Mechanism (of mind or ideas): Ger. *Mechanismus*; Fr. *mécanisme*; Ital. *meccanismo*. That explanation of mental process which traces it to the uniform behaviour of certain relatively simple and homogeneous elements, after analogy with particles of matter in motion.

The term was given currency by Herbart, who essayed to work out a 'Mechanik der Vorstellungen,' in which the rise and fall (Steigen und Sinken) of ideas were accounted for in terms of physical and mechanical principles. The term is not good, since it lends itself to interpretation in terms of physical analogy. (J.M.B.-G.F.S.)

Mediacy: see IMMEDIATE AND MEDIATE.

Mediacy or Mediation (*Vermittelung*): see HEGEL'S TERMINOLOGY, IV, V.

Median: see MEAN, and MID-.

MEDIATE: see IMMEDIACY AND MEDIACY, IMMEDIATE AND MEDIATE, (mediate) INTERFERENCE (2), MEDIATE (in theology), and MEDIATION.

MEDIATE (in theology) [Lat. *mediatus*]: Ger. *vermittelnd*; Fr. *mediat*; Ital. *mediato*. In religious thought, a term which characterizes the indirect agency of God in relation to man and the world. See MEDIATION.

According to the prologue of St. John's Gospel the creation of the world is mediated by the Divine Logos, while according to the Book of Genesis the development and organization of the world is mediated by the Holy Spirit. In the Christian scheme the salvation of man is mediated by the Divine Logos in the incarnation, the atonement, and the process of redemption. The idea of mediate agency is found in pre-Christian philosophy, especially in the system of Philo of Alexandria, who conceives God as purely transcendent and introducing subordinate beings or Logoi to mediate his agency in the world. (A.T.O.)

Mediation [Lat. *mediatio*]: Ger. *Vermittlung*; Fr. *médiation*; Ital. *mediazione*. (1) The mode by which a transcendent Deity is enabled to produce effects in the world without being himself the immediate agent of these effects.

(2) In Christian theology: that agency of Christ as revealer and atoner, by and through which man is redeemed from his ignorance and sin, and becomes reconciled with God.

The germ of the notion of mediation is contained in the Hebrew conception of Jehovah, and also in the Greek Logos. It became explicit in the Alexandrian thought of Philo, whose highest Logos was represented as performing the office of mediator between God and the world, thus making it possible for God, who is conceived in a purely transcendent fashion, to produce effects in the world without being contaminated by its evils. Mediation is the central idea in the Christian doctrines of atonement and redemption.

Literature: see references under ATONEMENT, and LOGOS. ZELLER, Philos. d. Griechen, Pt. III (1869); KIFERSTEIN, Philos. Lehre v. d. Göttlichen; HEINZE, Lehre v. Logos (1872). (A.T.O.)

Medical Psychology: Ger. *medizinische Psychologie*; Fr. *psychologie médicale*; Ital. *psicologia medica*. The consideration, mainly from a medical point of view, of abnormal and pathological mental states, and their symptoms.

With this meaning the term 'psychological medicine' (see Bucknill and Tuke, *Manual of Psychol. Med.*, 1858, and later Tuke, *Dict. of Psychol. Med.*, 1892) is also used. British and French associations for the study of the insane bear the name 'Medico-psychological Association.' Lotze, in his *Medizinische Psychologie* (1852), included what was later termed physiological psychology, or mental physiology (Carpenter and Maudsley). The term is closely related to psychiatry, psychopathology, abnormal psychology, and PATHOLOGY (mental) (q.v.), especially the last-named. (J.J.)

Meditation [Lat. *meditatio*]: Ger. *Nachdenken*; Fr. *méditation*; Ital. *meditazione*. A somewhat loose synonym for REFLECTION (q.v.). Not a technical term. (J.M.B.)

Medium [Lat. *medium*, middle = Gr. μέσος]: Ger. *Medium*; Fr. *médium*; Ital. *medium*, *medio*. A term applied, in connection with the phenomena of ANIMAL MAGNETISM (q.v.), HYPNOTISM (q.v.), and SPIRITUALISM (q.v.), to a person whose speech and action are supposed to be controlled by a foreign personality or by a disembodied spirit, and who speaks from knowledge gained in some supernatural manner; also called a 'sensitive.'

Some spiritualistic and other mediums claim the power of acting upon matter in violation of ordinary physical laws; others claim to be the means of communication between the departed and the living. As such communications are frequently given while the medium is in an abnormal, semi-conscious condition

(usually termed TRANCE, q.v.), the explanation of the phenomena of mediumship may possibly be sought in a psychological analysis of such quasi-abnormal conditions. That many of the claims and exhibitions of alleged mediums are little more than vain pretence and more or less clever deceit has been abundantly proved; but in many other cases the phenomena must be considered genuine.

A case which may be cited as a typical form of the phenomena as exhibited in recent years is that of Mrs. Piper (cf. *Proc. Soc. Psych. Res.*, xii-xv). For the various manifestations of mediums in SPIRITUALISM and in TRANCE conditions see those terms. Anthropologically, the medium is variously represented in the Shaman or medicine man, in oracles, and in superstitions, customs, and beliefs relating to the influence of the dead upon the living. See VODOO, FETICH, and MAGIC. Cf. general treatment in Lehmann, *Aberglaube und Zauberei*, and the citations under SPIRITUALISM. (J.J.)

Medium (in philosophy): see TERTIUM QUID, MILIEU, and ENVIRONMENT.

Megalomania [Gr. μέγας, great, + μανία, madness]: Ger. *Megalomanie*; Fr. *mégalo-manie*; Ital. *megalomania*. A special form of delusion occurring in certain forms of insanity (cf. in particular, MANIA, and general PARALYSIS), in which the patient feels himself elated, his energies overflowing, his mind filled with a wealth of brilliant thoughts, his strength gigantic, his possessions vast, his achievements remarkable, his powers supreme, &c.

To keep pace with these exalted notions he invents the most brilliant accounts of his endowments and possessions. He is a genius among mankind, can speak a score of languages, has a wonderful voice, the skill of a Rembrandt; he has estates in all parts of the world, has thousands of servants, is about to establish vast mercantile operations; he has distinguished himself in battle, is a hero among the fair sex, is about to assume command of armies; or he has great schemes for making everybody wealthy, for reforming mankind, and so on indefinitely. The notions often assume the most extravagant forms, particularly as the brain disease advances. The megalomaniac poses as an emperor, as the son of Venus, as the ruler of the earth, as God himself. The patient is absorbed in these exalted reflections, which he is ever ready to extend and expand, and does not realize the contradiction between his actual surroundings and the ideal world in which he lives.

Synonyms of megalomania are 'expansiveness' and 'exaltation.' Cf. DELUSION. (J.J.)

Literature: treatises on mental PATHOLOGY (q. v.), especially those of DAGONET, SCHÜLE, CLOUSTON, KRAFFT-EBING, KRAEPELIN, and BALLET-MORSELLI; also EMMINGHAUS, Allg. Psychopathol.; FRIEDMANN, Ueber den Wahn (1894). (E.M.)

Megarians: see SCHOOLS of GREECE, II.

Melancholia [Gr. μέλας, black, + χολή, bile]: Ger. *Melancholie*; Fr. *mélancolie*; Ital. *malinconia*. In its current use melancholia applies to all abnormal mental conditions dominated by depression, while formerly it was a synonym of partial insanity or MONOMANIA (q. v.). According to Pritchard, the Greek μελαγχολῶν means simply to be mad, without any reference to lowness of spirits. The term was opposed to mania, and became more and more connected with gloom in the sense in which it is used exclusively to-day. Esquirol felt obliged to call the depressive insanities proper, *lypémanie*, in order to escape confusion. Rush uses the term *Tristomania*.

The varieties commonly classified are simple melancholia, stuporous, delusional, homicidal, suicidal, puerperal, acute, chronic melancholia attonita, &c. It is obvious that many dissimilar conditions are thus brought under one heading, simply because they are dominated by depression. A careful analysis leads to the recognition of more essential characteristics; but the nosological interpretation of the various types is still a topic of some controversy.

The following are the most common symptom-complexes: (1) Constitutional depression: a pessimistic temperament that is inclined to see the dark side of everything, and is led to gloominess and despondency upon slight provocation. Such moods or periods often present a temporary character in the form of more or less periodic exacerbations, which, however, in distinction from the next group, rather readily pass off with an improvement in the circumstances of the patient. Such attacks are occasionally accompanied by marked feelings of anxiety.

(2) Simple melancholia proper: an excessive or altogether unjustified depression, often accompanied by defective sleep, precordial pain or uneasiness; a susceptibility for the unpleasant and wearing aspect of things only, and a feeling of self-depreciation, of sinfulness, without insight into the unwarranted morbid nature of the condition. The patient

feels himself too bad to live or to be treated kindly. There is usually a feeling of inability and indecision, and especially in the form which is merely a phase of manic-depressive insanity (see MANIA), a difficulty in thinking clearly, and a retardation or inhibition of spontaneous activity.

This may be followed by delusional elaboration; the patient comes to believe that everything, the whole world, will come to a bad end, that it is all the patient's fault; and an occasional hallucination may appear to corroborate and elaborate such feelings and thoughts. This condition is frequently accompanied by a strong affect of fear and anxiety for self and family, or suicidal impulses, or great restlessness, or again self-absorption, or retardation of all activity, leading to a form of stupor.

(3) Other forms are characterized by prolonged 'neurasthenic' malaise and a feeling of depression (frequently over moral matters), and by a great tendency to refer the feelings to influence of others, to poison, to hypnotism, to electricity, to nocturnal rape; or there are hypochondriacal complaints, frequently of an absurd character. Hallucinations are common. The whole picture is apt to have a certain resemblance to the paranoic types in later periods of life (after 35), while in earlier periods it undoubtedly belongs usually to the processes of deterioration (*dementia praecox*), and often presents distinct features of *katatonia*.

(4) Depressive delirium, together with great anxiety, vivid hallucinations, fear, desire to escape from danger, even by suicide, sometimes with remarkably good appreciation of the immediate circumstances and environment. It is apt to occur after acute diseases, in pregnancy, &c., and is at times difficult to distinguish from alcoholic delirium.

(5) As a special episode in the types (2) and (4) may be mentioned the *délire de négation* (*délire* in the broad sense of delusional state); the patient believes that he is nobody, that the whole world is imaginary, gone, burned, 'everybody dead and nobody left to tell the tale,' &c. A similar exaggeration of depressive delirium occasionally occurs in senile dementia and in general paralysis.

(6) 'Katatonic melancholia,' for which see KATATONIA. It is perhaps closely related to type (3), but usually of acute onset, with hallucinations of commands to be good, to perform simple actions that have a mystical

and symbolic meaning (spitting at a shoe, taking attitudes of prayer and poses, &c.); with catalepsy, mutism, refusal of food, stupor, often with perfect knowledge of what is going on and perfect remembrance of incidents. The occasional excitements show stereotypy of expression, and lead frequently to repetition of sentences (e.g. 'give me a dose of poison to put me out of the way quick,' repeated continually for months), or of senseless sounds or confused silly talk with reiterations (verbigeration). Rather often sudden recovery occurs, if the first attack does not lead to dementia.

The forms (1) and (2) are usually recoverable conditions of greatly varying duration, frequently belonging to the constitutional, recurring, and circular psychoses, the simple depressions being especially prone to occur in several successive generations of a family. In the circular cases, the predominance of an inhibition or retardation of movements and of thought is very striking, while the anxious and agitated forms of type (2) are especially characteristic for the climacteric period, and pass without a distinct line into the types of presenile depression with absurd hypochondriacal delusions, shallow affects, and usually poor prognosis. Many cases of type (4), as well as of (3), are processes of deterioration (dementia praecox), or, in a later period of life, of paranoic conditions.

The individual differences in a large series of cases of melancholia are so great that it would be a grave injustice to the facts to try to describe them as one condition in one connected composite picture.

Clinical experience and experimental psychology show that there are undoubtedly several distinct disease-processes which account for the differences of the above types. But definite statements as to their nature and concerning the pathological anatomy seem as yet premature.

Melanchthon (or **Melancthon**), Philip. (1497–1560.) Enjoyed unusual educational advantages under the supervision of his grandfather and of Reuchlin, who translated his name Schwarzerd ('Black earth') into the Greek 'Melanchthon.' Entered the University at Heidelberg, 1510; removed to Tübingen 1512, where in 1514 he began lecturing on the classics. In 1518, declining calls to both Leipzig and Ingolstadt, he went to Wittenberg, where he was associated with Luther, who, together with the students, induced him to turn his attention to theology. He wrote and repeatedly revised the Augsburg Confession.

Meliorism [Lat. *melior*, better]: Ger. *Meliorismus*, *Theorie der Weltverbesserung*; Fr. *méliorisme* (not in use); Ital. *migliorismo*. A belief in the possibility of the improvement of the world by human effort, generally implying the further belief that such progressive improvement is a fact and even a law of evolution. (A.S.P.P.—H.S.)

The term was invented by George Eliot, in connection with the question of optimism and pessimism, to express a view which she put forward as a *via media* between these two extremes (see an article on George Eliot by Edith Simcox in the *Nineteenth Century* for May, 1881). Used by her in conversation, it was adopted by Sully in his *Pessimism* (1877), and has since become current. Sully defines it as 'the faith which affirms not merely our power of lessening evil—this nobody questions—but also our ability to increase the amount of positive good. . . . By recognizing the possibility of happiness and the ability of each individual consciously to do something to increase the sum total of human welfare present and future, meliorism gives us a practical creed sufficient to inspire ardent and prolonged endeavour' (*Pessimism*,

399). The belief connects itself with the modern theory of evolution, which it interprets in a beneficent and quasi-religious light. 'Faith in a gradual abatement of evil by the method of progressive evolution is now a favourite scientific faith: this faith may be regarded as the form which an unconsciously religious conception of the universe is assuming in professedly agnostic minds' (Fraser, *Theism*, 2nd ed., 282). Cf. OPTIMISM AND PESSIMISM (also for *Literature*). (A.S.P.P.)

The English meliorate and melioration (the usual form being ameliorate, from *ad* + *melioratus*) might well be used (Ger. *verbessern*, *Verbesserung*; Fr. *améliorer*, *-ation*; Ital. *migliorare*, *miglioramento*) in connection with meliorism. (J.M.B.)

Melissus. Lived about 450 B.C. Born in Samos. He is called a disciple of Parmenides. His work in prose (*περί φύσεως* or *περί θύρας*), of which fragments remain, is a refutation of the Ionian Physicists. He was also victorious as a naval commander in battle with the Athenians.

Melody: see MUSIC.

Memory [Lat. *memoria*]: Ger. *Gedächtniss*, *Erinnerung* (princ. in compounds) Fr. *mémoire*; Ital. *memoria*. Ideational process, so far as it takes the form of the reproduction and recognition of prior experiences in their original time order. Memory thus includes the three relatively distinguishable functions of REPRODUCTION, RECOGNITION, and LOCALIZATION (in time). Cf. those terms.

Plato calls memory *σθηρία αίσθησεως* (*Philebus*, 34 A). This failed to distinguish between memory proper and retentiveness in general. Aristotle, however, distinguished between *φαντασία* and *μνημόνευμα*. Hobbes defines both memory and imagination, which with him includes all mental imagery as 'decaying sense.' The word memory is used to indicate that the mental image presupposes a primary experience, which it revives. The word imagination is used to indicate that the revival is relatively faint, or, as Hobbes would say, 'decayed.' Locke says that memory is 'the power the mind has to revive perceptions which it has once had, with the additional perception annexed to them—that it has had them before' (*Essay*, Bk. II. chap. x. § 2). Hume raises the question of the difference between memory and imagination. According to him the distinction is one of degrees of vivacity. The vivacity or liveliness of an experience coincides in Hume with power to compel belief in the object of the

experience. Vivacity—and therefore belief-compelling power—belongs in the highest degree to actual sensations, or, as he calls them, impressions. 'We find by experience that, when any impression has been present with the mind, it again makes its appearance there as an idea, and this it may do after two different ways, either when in its new appearance it retains a considerable degree of its first vivacity and is somewhat intermediate between an impression and an idea, or when it entirely loses that vivacity and is a perfect idea. The faculty by which we repeat our impressions in the first manner is called the memory, and the other the imagination' (*Treatise on Human Nature*, i. 193). Reid has a very good chapter on 'Theories concerning Memory' (*On the Intellectual Powers*, Essay III, chap. vii), in which he criticizes the definitions of Locke and Hume. He remarks that Locke is inaccurate in saying that the perception itself as a mental occurrence is revived. 'An ability to revive our ideas or perceptions, after they have ceased to be, can signify no more than an ability to create new ideas or perceptions similar to those we have had before' (Essay III, chap. vii. 355, Hamilton's edition). The true way of putting the case, according to Reid, is to say that the memory-idea is a thought of the same object as that which had been originally perceived. The same criticism applies to Hume. Reid also urges against Hume that he defines in a circle. 'For can we find by experience that an impression, after its first appearance to the mind, makes a second and third, with different degrees of strength and vivacity, if we have not so distinct a remembrance of its first appearance as enables us to know it on its second and third, notwithstanding that, in the interval, it has undergone a very considerable change?' (*ibid.* 354). 'It has been held by some psychologists that memory proper includes the representation of one's past self as agent or patient in the event or situation recalled. And this is true as regards all but the earliest human experience, at any rate; still, whereas it is easy to see that memory is essential to any development of self-consciousness, the converse is not at all clear, and would involve us in a needless circle' (Ward, art. Psychology, *Encyc. Brit.*, 9th ed., xx. 63). Cf. the topics immediately following; also ORGANIC MEMORY. (G.F.S.—J.M.B.)

Recently the question of 'affective memory' has arisen for discussion. See REVIVAL.

Literature: the works named; the textbooks of psychology (citations are made in those of DEWEY, BALDWIN, LADD, JODL, and JAMES); the Psychological Index, 1 ff.; the following topics; BIBLIOG. G, 2, u; EISLER, Wörterb. d. philos. Begriffe, 'Gedächtniss.' On affective memory, see URBAN, Psychol. Rev., viii, May, July, 1891, 262. (J.M.B.)

Memory (defects of). Abnormalities of memory fall readily into the two classes of excess and defect. An equally fundamental distinction is that between affections of general retentiveness and affections of special acquisition groups, i. e. classes of memories.

The nature of the case, whether mere absence of memory, distortion of memory, illusion of memory, or, again, whether temporary or permanent, periodic or progressive, is also of great importance. The most general synonym for defect of memory is AMNESIA (q. v.), which, however, when used with precision, applies only to degrees of failure of retentiveness. Paramnesia indicates a defect of distortion or illusory memory, a false recollection; hypermnnesia refers to conditions of unusual exaltation of memory.

Any adequate account of defects of memory must be based upon, and developed in conformity with, an analysis of the normal functions which the term comprises. Normal memory is an expression of the functional activity of the nerve centres, whereby, on the basis of vestiges or residua established as concomitants of sense impressions, of actions, of emotions, or in brief of experience, the same or similar presentations are recognized when they recur, enter freely into combination with other remembered presentations, and may be more or less successfully summoned into consciousness by voluntary effort. Residua of some sort are thus an indispensable requisite of all acquisition, whether carried on subconsciously and automatically or with conscious intent. In the larger sense we remember how to walk as well as how to talk; we remember the use of a knife or the sound of a printed letter; we remember the odour of tuberoses or the exhilaration of a toboggan slide; we remember, too, what we liked in our childhood, or the scenes of former travels; we remember that *bœuf* is the equivalent of ox, or that 622 is the date of the Mohammedan Hegira. It is obvious that memory—and with it defects of memory—comprises a very heterogeneous assemblage of processes, which reflect the variety of psychological functions involving the memory factor.

A defect of memory is an expression of the incapacity of a group (or of certain groups) of centres to exercise their normal functions, or of a tendency which they show to function in an abnormal manner. Thus considered, defects of memory may be (1) general, involving (a) a defective capacity of a nervous centre (or centres) to establish residua or dispositions of memory; in this condition an object not in the range of vision is forgotten, an action just performed is as though it had not been done at all, and may be repeated again and again without becoming familiar; (b) or it may be that this power is exalted so that impressions reappear in memory with unusual completeness and vividness. Along with normal power to revive in memory current acquisitions, the defect may be (2) special: a loss of certain experiences from the memory accumulations of the past; and this again either temporarily or permanently. After an accident, the experiences of minutes or hours or days preceding the moment of the accident are often forgotten; the recovery from fever leaves a blank in the patient's memory continuum; in cases of periodic changes of personality and of hypnotic states, the subject in one period is ignorant of his experiences in the other, and it may be to such an extent that manual facility and other automatic accomplishments as well as intellectual acquisitions are involved. (3) It may be that only certain groups of images fall away: one patient loses the power to recognize printed letters or to recall the manner of making the sounds which they indicate, while retaining the power to speak and to understand conversation (see SPEECH AND ITS DEFECTS); another loses the memory of a foreign language while retaining his vernacular; another loses the memory for substantives or proper names, and so on. (4) The abnormality may consist in a false localization in time, of false concomitants or order of the same; of imaginary additions to real events; of the entire illusory recollection of what has not been experienced, the apparent familiarity of what is really novel, and the like.

Briefly, the memory functions may be altered in regard to their 'storing' or retentive functions; in regard to their reproductive functions (the recorded impressions in part or in whole, for shorter or longer periods, are not recalled or not recognized); or, finally, the reproductive or recognitive function may be inadequately or in some one of many ways perversely performed.

No adequate account of memory defects along the line of this classification (which may be characterized as an internal classification depending upon variations from normal functional activities) has as yet been made, but it is clear that the familiar cases of such defect are readily interpretable on this basis.

(1 *a*) may be termed *acquisitional amnesia*, and occurs both temporarily and permanently in imbeciles, in dementia, and as the result of serious shock or injury. As elsewhere, certain groups of centres may be more closely involved than others. (1 *b*) represents *hypermnnesia*; it may be exhibited as unusual scope of memory (arithmetical prodigies, chess-playing virtuosi like Zuckertort or Pillsbury playing twenty games at once and blindfolded, considered as abnormal); or unusual celerity, accuracy, or vividness; or may combine these qualities in various proportions. As before, such hypermnnesias may be generally distributed, but are more apt to affect special groups of centres. Group (2) constitutes the ordinary special amnesias, temporary, or permanent, or periodic, and may affect subconscious and automatic, or (more usually) voluntary acquisitions alone. They are related to defective nutritional or generally degenerative conditions of cerebral centres, and are apt to involve more or less serious impairments of consciousness. See *PERSONALITY* (defect of), and *SUBCONSCIOUS*. (3) represents the various partial amnesias, while (4) represents the equally varied paramnesias and illusions of memory.

Regarding illusions of memory, many fall entirely within the bounds of the normal. Forgetting is as normal as remembering, and misremembering is a form of forgetting. In experiments upon memory as well as in studies of mal-observation, errors of memory are usually classified as those of omission, of substitution, of transposition, and of addition. Material may be omitted, may be falsely localized, may be confused with other data, and extraneous matter may be introduced. The normal laws of association and specialization of memories are competent to account for such errors in general outline, though not in detail. In addition, there are more obscure illusions, which have been classified (Burnham) as (*a*) simple paramnesia or the confusion of the results of imagination with true memory images; in this way habitual liars come to believe their own inventions, and the systematic delusions and accusations

of the insane may find a starting-point in a similar pseudo-reminiscence (Kraepelin); (*b*) identifying paramnesia, also termed double memory, which is the above-mentioned false familiarity, the 'has-been-experienced-before' consciousness; this too occurs in normal persons, and may occur in insanity with unusual fullness of detail, the patient feeling that the thing about to be done has been done before, and that he can anticipate what is to occur next; (*c*) suggestive or associating paramnesia, in which actually occurring impressions arouse false reminiscences; in this way suggestions that one has experienced things which have not been experienced are accepted, and false testimony is produced frequently by children (MOTET, cited below); it may also be that certain types of presentiments are really cases of similar pseudo-reminiscences.

The more usual method of classification approaches the subject externally, on the basis of the character of the symptoms; and such a classification, while not antagonistic to the one just outlined, results in a different exposition. It is best represented by Ribot, who proceeds as follows:—

(1) General amnesia, which is (*a*) temporary, or (*b*) periodic, or (*c*) progressive, or (*d*) permanent, and is either congenital, as in idiocy, or acquired, as in severe dementia; (2) partial amnesia; (3) hypermnnesia.

With regard to the occurrence of memory defects, it may be noted, in addition to the illustrations above cited, that temporary defect may be produced by fatigue, by anxiety, &c.; it appears as a marked characteristic of epileptic seizures (see *EPILEPSY*), as an effect of shock or injury to the brain, and as the result of the action of drugs (see *PSYCHIC EFFECT OF DRUGS*). More permanent amnesias occur in the general debility of illness or old age, and in profound affections of the brain, as in mania, melancholia, dementia. In hysteria occur at times peculiar periodic dislocations of the memory basis, which tend to divide the experiences of the patient into relatively independent and unrelated memory systems (for details see references under *HYSTERIA*, and defects of *PERSONALITY*). Typical cases of progressive amnesia (and the same is true of partial amnesia) are recorded in connection with aphasic disorders and in general paralysis. Hypermnnesia occurs as an individual endowment, and in response to the stimulation of drugs, of fever, of hypnotic suggestion, and states of normal or abnormal mental excitement. The occurrence of some

one form of unusual special memory in combination with mediocre general ability, or even with imbecility, has been noted.

Literature: RIBOT, *Diseases of Memory* (Eng. trans., 1882); GUILLON, *Les Maladies de la Mémoire* (1897), a monograph on hypermnnesia, with bibliog.; PATRIZI, *Memoria e Oblio* (1890), with bibliog.; SULLY, *Illusions*, chap. x; BURNHAM, *Amer. J. of Psychol.*, ii. 39, 225, 431, 561 (with bibliog., 431 on abnormal memory); KRAEPELIN, *Arch. f. Psychiatrie*, xvii. Heft 3, xviii. Hefte 1 and 2; ROYCE, *Mind*, xiii. 244; HODGSON, *Proc. Soc. Psych. Res.*, iv. 381; DAVEY, *ibid.*, 405; MOTET, *Les faux Témoignages des Enfants* (1887); OSBORN, *Illusions of Memory*, *North Amer. Rev.* (1884), 476; PARDO, *I Disturbi della Memoria* (1899); SOLLIER, *Troubles de la Mémoire* (1892). General works on MEMORY (q.v.) often contain data regarding abnormal memory. See also under SPEECH AND ITS DEFECTS. (J.J.)

Memory (experiments on). Four experimental methods of investigating memory are sometimes distinguished: those of 'reproduction,' 'identification' ('recognition'), 'selection' ('comparison'), and 'description.' All investigations so far published, however, may be classified under the first two heads. Widely defined, description belongs to reproduction, and comparison may be considered a function of recognition. (E.B.T.—J.M.B.)

It is clear that various bases of classification of problems and literature might be taken. Thus one might arrange them under the sense-organs to which the stimuli employed appeal. A good classification is that in terms of attribute of stimulus, under five heads (cited with authorities):—

(1) Time (Paneth, &c.); (2) Space (Baldwin, &c.); (3) Intensity (Weber, &c.); (4) Quality (Wolfe, &c.); (5) Composition (Ebbinghaus, &c.). (E.B.T.)

The methods have recently been classified and criticized. Kennedy (*Psychol. Rev.*, v. 477) reviews the subject and finds much confusion from the failure to discriminate the methods with exactness. In his opinion the three methods distinguished by Baldwin (under the terms reproduction, identification, and selection), and suggested and used also by Binet (under the terms reproduction, recognition, and comparison), are psychologically distinct from one another. These writers hold that the circumstances of 'recognition'—as between mere identification of a recurrent stimulus and its 'selection,' with 'comparison,' from

others—are all-important, and justify the careful separation of these methods (cf. the general statement by the present writer, *Story of the Mind*, 138 ff.). The method of 'description' is hardly a memory method, since it really gives exercise to association and apperception (in its wider sense), as Ebbinghaus clearly shows in his attempt to give it exactness (*Sitzber. d. 3^{ten} Int. Cong. d. Psychol.*, München, 1896). (J.M.B.)

The psychological basis of Kennedy's classification is criticized by Bentley (*Amer. J. of Psychol.*, xi. 1), who distinguishes between reproduction and recognition, making the other methods mentioned sub-types of one of these; he adds a third method, 'recall and comparison,' which takes account of the memory image. Reproduction and recognition possess quantitative value chiefly; recall and comparison, qualitative as well. (E.B.T.)

Literature: more general titles are BURNHAM, *Amer. J. of Psychol.*, ii. 39, 225, 431, 568 (with bibliog.); JAMES, *Princ. of Psychol.*, 'Memory'; KENNEDY, *Psychol. Rev.*, v. 477 (bibliog. to July, 1898); BENTLEY, *Amer. J. of Psychol.*, xi. 1 (bibliog. to 1899); BALDWIN, as cited above. Researches classed roughly by methods (the stimulus is also given in some instances) are:—

(1) *Reproduction and Description:* EBBINGHAUS, *Ueber d. Gedächtniss* (1885); MÜLLER and SCHUMANN, *Zeitsch. f. Psychol.*, vi, Syllables; PANETH, *Centralbl. f. Physiol.*, iv, Time Intervals; MÜNSTERBERG, *Beitr. z. exper. Psychol.*, iv, 'Muscular' Retention, and Influence of Interval on Eye and Arm Movement; W. G. Stud., xv, Visual Distances. (E.B.T.-J.M.B.)

Memory Image: see IMAGE. The form 'Memorial Image' is not recommended.

(J.M.B.-G.F.S.)

Memory Time: see REACTION TIME.

Mencius [Lat. form of Chinese *Müng-tse*: *Müng*, the philosopher]. (b. cir. 371 B.C.) With Confucius, one of the two greatest Chinese philosophers. See ORIENTAL PHILOSOPHY (China).

Mendelssohn, Moses. (1729-85.) Studied the Bible, the Talmud, and Maimonides with early zeal. Became (1750) tutor in a rich Jewish family in Berlin, and in 1754 book-keeper in the firm. Became an intimate acquaintance of Lessing. In 1763 received a prize from the Academy of Berlin. Died in Berlin.

Meninges: see MENINX.

Meningitis: Ger. *Hirnhautentzündung*; Fr. *méningite*; Ital. *meningite*. Diseased conditions of the membranes (see MENINX) investing the brain (leptomeningitis, pachymeningitis). Cf. BRAIN (Glossary). (H.H.)

Meninx [Gr. *μηνυξ*, membrane]: Ger. *Hirnhaut*; Fr. *méninge*; Ital. *meninge*. One of the three membranous envelopes of the central nervous system. It is chiefly used in the plural (meninges) and in composition. Cf. BRAIN. (H.H.)

Mental Blindness and Deafness: see BLINDNESS, and DEAFNESS (mental or psychic).

Mental Chronometry: see REACTION TIME.

Mental Development: Ger. *seelische Entwicklung*; Fr. *développement mental*; Ital. *sviluppo mentale*. The series of processes through which the individual mind naturally passes from birth to death.

Development is here, as in its biological use, contrasted with EVOLUTION (mental, q.v.).

It is the ontogenetic as contrasted with the phylogenetic mental process. The questions which come up in connection with mental development are those of one branch of GENETIC PSYCHOLOGY (q.v.) as contrasted with analytic psychology; that is, they are questions of the antecedents of mental states and of the laws of change from one stage of mental life to another. In general, the distinction is analogous to that between morphology and physiology. Certain questions, however, as in biology, belong to the genetic as such, and involve the relation of development to evolution; see RECAPITULATION, REGRESSION, ATAVISM, VARIATION. Among the problems peculiar to mental development, on the other hand, some of the more important are: the genetic relation of the motor to the sensory processes; the original forms of consciousness, with the ultimate modes which its process takes on; the law of the relation of mind to its environment, both physical and social; the relation of instinctive endowment to acquisition and GROWTH (q.v.); the methods of mental ACCOMMODATION (q.v.); HABIT (q.v.) and its relation to accommodation; the interaction of the primary functions and the order of the appearance of the relatively new stages which each of them successively assumes; the tracing of the constant factors, and their relation to the variations which introduce new departures, &c. Most of the problems of philosophical biology, in fact, find analogies in mental evolution and development; and in many cases the psychological solution is necessary to the biological solution, since the problem is really one with two faces.

Certain departments of the subject have been marked off in recent years and in part developed. We have CHILD PSYCHOLOGY (q.v.) treated as a more or less separate subject, and SOCIAL PSYCHOLOGY (q.v.) similarly. The influence of the genetic point of view is permeating more and more the treatment of general or analytic psychology. It is being seen that analysis is never adequate if it be purely dissection, for the actual statement of mental process must include more or less change and development. Mental development in the animals is treated in COMPARATIVE PSYCHOLOGY (q.v.).

Literature: BIBLIOG. G, I, e, f; titles given under the topics cited above; Psychological Index, in loc., 1 ff. Of recent works, JODL, Lehrb. d. Psychol., and STOUT, Manual of Psychol., are written from a genetic point of view. BALDWIN's Ment. Devel. (2 vols.)

is devoted explicitly to this subject proper and to EVOLUTION (mental, q. v.). (J.M.B., G.F.S.)

Mental Disease: see PATHOLOGY, and the various special names of mental disorders. Cf. PSYCHOSIS, and NEUROSIS.

Mental Energy: see ENERGY (ad fin.), and cf. SOCIAL LOGIC.

Mental Evolution: see EVOLUTION (mental).

Mental Pathology: see PATHOLOGY (mental).

Mental Science: see PSYCHOLOGY, and cf. MORAL SCIENCES.

Mental Type: see TYPE (mental).

Mental Unity: Ger. *Einheit des Bewusstseins*; Fr. *unité de la conscience, unité du moi*; Ital. *unità della coscienza*. The apparent oneness of the individual mind.

Theories of mental unity are abundant both in psychology and in metaphysics. The three most prominent theories are: (1) the intuitional, which holds not only to the psychological immediacy of the consciousness of unity, but also to its rational validity as a datum of thought; (2) the empirical theory, which makes the consciousness of unity an experiential product: that is, it denies that it is psychologically IMMEDIATE (q. v.), although admitting that it is psychically so; (3) genetic theories, which hold that unity is the form of organization of conscious contents at any stage of mental development; not a constant datum or a content at all, but a changing aspect of conscious process. On this view the unity of effort (conation) is different from the unity of feeling or cognition. A newer view under this head finds mental unity in the consciousness of the motor dispositions or habits which represent practical accommodations, or adjustments of attention.

Conscious unity is often confused with consciousness of self. But so far as self is a content, it has, rather than is, unity. Only the theory which makes the subject-self, or I, the form of organization of knowledge could identify this with the consciousness of unity.

The organization theory of the consciousness of unity is supported by the cases known as dual or MULTIPLE PERSONALITY (q. v.), in which division of the content of consciousness results in the appearance of different quasi-personalities, each with its own consciousness of unity. (J.M.B., G.F.S.)

Besides the holders of the intuitional theory mentioned above, many idealistic writers find in the consciousness of unity an *a priori* form or prerequisite to all experience, and argue to a

noumenal or transcendental principle of unity, a soul or self. The scholastics made unity and simplicity attributes of the soul. Descartes' 'cogito ergo sum' is followed by Kant's 'ich denke,' a principle of the 'transcendental unity of apperception'—a function of the transcendental self. Cf. KANT'S TERMINOLOGY (glossary). Kant holds, as to empirical unity, however, that the identity of consciousness is only a formal condition of thought, and does not prove the numerical identity of the subject (Third Paralogism).

In later philosophy, Leibnitz's MONAD (*μόνος*, one) and Herbart's REAL are principles of unity (see those terms). Lotze finds in mental unity in the midst of change the category (M) of explanation of the world. Indeed, most spiritualistic and idealistic philosophy is from the start an interpretation of experience and of the world as a system in some way resting upon mental unity. Cf. the psychological conceptions INDIVIDUAL, and IDENTITY.

Literature (psychological): appropriate passages in the psychologies; ARDIGÒ, *L'Unità della Coscienza*, Op. Filos., vii. (1898); MAUDSLEY, *Mind*, xvi. 161; citations from German authors in EISLER, *Wörterb. d. philos. Begriffe*, 'Einheit'; works on metaphysics generally. (J.M.B.—K.G.)

Mentality [Lat. *mens*, mind]: Ger. *psychische Beschaffenheit*; Fr. *mentalité*; Ital. *mentalità*. The distinctive characteristics of mind or conscious life abstractly considered.

(G.F.S.—J.M.B.)

Applied particularly to the different grades of mental endowment, as exhibiting more or less (higher or lower) mentality. Cf. SUBCONSCIOUS. (J.M.B.)

Mercantile System: Ger. *Mercantil-system*; Fr. *système mercantile*; Ital. *sistema mercantile*. A group of theories as to material wealth which prevailed in the 17th and 18th centuries, and under which the BALANCE OF TRADE (q. v.) was made a criterion of gain or loss in such wealth.

The best known writers of this school are perhaps Mun (1664), Petty, and Stewart. The most successful practical exponent was the French financier Colbert.

The mercantile theory has the merit of being the first system of political economy developed. Its fundamental error lies in mistaking a balance of sales and purchases for the real criterion of increase of wealth. An individual or a nation which tries to buy as little as possible is pursuing a miserly policy. The gold may be worth less than the things the

gold will buy. Not diminution of purchases, but increase of investments is the true criterion of excess of production over consumption.

Literature: SMITH, *Wealth of Nations*, Bk. IV; COSSA, *Introd. to the Study of Polit. Econ.* (A.T.H.)

Mercy [Lat. *merces*, reward]: Ger. *Gnade*; Fr. *grâce*; Ital. *pietà*, *misericordia*. The trait of character which tends to mitigate the penalties which may be exacted for offences against law. Cf. PITY. (W.R.S.)

In theology: that attribute of the divine nature by virtue of which guilt is overlooked and a being who deserves punishment is treated with grace and kindness.

Mercy stands contrasted with justice in respect to merit and demerit. It is to be distinguished from love, which has no direct reference to desert. Mercy must also be distinguished from compassion (*misericordia*), which has direct reference to suffering rather than to ill desert. In the Christian scheme of redemption, mercy and justice are reconciled by the atonement of Christ, which cancels the claim of justice and gives free scope to the forgiving function of mercy.

Literature: see ATTRIBUTES (of God). (A.T.O.)

Merit [Lat. *meritus*, deserved]: Ger. *Verdienst*; Fr. *mérite*; Ital. *merito*. The degree in which an agent is worthy of approbation or reward in respect of his conduct. It is contrasted with demerit, which implies not only absence of merit, but liability to disapprobation or to punishment. See also GUILT.

The conception of merit is one of considerable difficulty in ethics—largely from the intermixture of theological conceptions. From the purely moral point of view it is commonly held that merit belongs to the performer of all good or virtuous actions. Thus Butler says, 'Our sense or discernment of actions as morally good or evil implies in it a sense or discernment of them as of good or ill desert' (*Diss. on Virtue*). Sometimes merit is only ascribed when the good action is performed in spite of a temptation to evil; and the degree of merit is then said to vary with the strength of temptation overcome. Thus there is a tendency to restrict the application of the conception of merit to cases in which the motive is unselfish or even self-sacrificing. The tendency both of Calvinistic theologians and of many rationalistic moralists is to refuse to admit that merit can belong to human actions: a man can never do more than his duty. This is the position of the Stoics and of Kant.

The conception is more easily applied (though not more easily justified) when some external ground for deciding upon it is adopted. Thus the Utilitarian ethics regards meritorious actions as socially useful actions whose omission would not be punished, while their performance is rewarded by preferment or by good repute—just as duties are held to be socially useful actions, the omission of which would be punished. (W.R.S.)

The distinctive characteristic of 'merit' is primarily claim to reward (or compensation for effort) as attaching to the conduct of a human being (or something else personified). But, as ethical ideas and sentiments grow more refined, it is recognized that for the highest merit the only appropriate reward is just the recognition of quality of goodness in the 'meritorious' conduct, together with emotional concomitants of such recognition—love and admiration, and their expression in praise and gratitude. In this way, the notion of reward falling into the background, 'merit' comes to be hardly distinguishable from 'worth'—which again is not distinguished from 'goodness' viewed especially as a quality admitting of degrees. See WORTH. (H.S.)

Merit (in theology). The surplus which may remain to the credit of any one in the sight of God after the strict claims of justice and obligation have been satisfied; a conception distinctive of, but not peculiar to, Christian theology.

Merit may be either of Christ or of the saints. The merit of Christ is that credit with God which he acquires through his voluntary obedience to the law which man has broken. This merit constitutes a store of righteousness which may be imputed to the repentant and believing sinner for his justification. There is a radical difference of opinion regarding the question of the merit of the saints, between the Roman Catholic and Reformed Churches, the latter denying the possibility of any merit with God, while the former distinguishes between two kinds of merit, that of congruity and that of condignity; or relative and absolute merit. Only Christ himself can acquire absolute merit. But a man may by the grace of the Holy Spirit go beyond the strict measure of duty, and may acquire relative merit with God, which may under prescribed conditions be transferred to the credit of others. See SUPEREROGATION. (A.T.O.)

Mesenchyma [Gr. μέσος, middle, + ἔγχυμα, infusion]: Ger. *Mesenchyma*; Fr. *mésenchyme*; Ital. *mesenchima*. The non-epithelial portion

of the mesoderm. In vertebrates the mesenchyma assumes at first the character of embryonic connective tissue, i. e. the scattered undifferentiated cells lie in a homogeneous matrix. During the further development of the embryo the mesenchyma becomes differentiated into a great variety of tissues: connective tissue proper, cartilage, bone, smooth muscle fibres, lymph-glands, spleen, &c.

The term was introduced by the brothers R. and O. Hertwig (see O. Hertwig, *Entwicklungsgesch.*, 1st and 6th ed.). (C.S.M.)

Mesmer, Franz (or **Friedrich**) **Anton.** (1734–1815.) Educated at Dillingen, Ingolstadt, and (in medicine) Vienna. Began magnetic or 'mesmeric' treatment in 1772; moved to Paris (1778), where he was eminently successful. Practised in London with less success. A royal committee of eminent French scientists pronounced unfavourably as to his methods in Paris. Gave the name mesmerism to the phenomena now designated hypnotism.

Mesmerism: see MESMER, HYPNOSIS, and HYPNOTISM.

Meso- (in compounds) [Gr. μέσος, middle]: Ger. *Mittel-*; Fr. *méso-*; Ital. *meso-*. Of medium size or position between extremes; as mesocephalic, having a head of medium length. Cf. INDEX (cephalic). (J.J.)

Mesoblast [Gr. μέσος, middle, + βλαστός, germ]: Ger. *Mesoderm, mittleres Keimblatt*; Fr. *mésoblaste, feuillet moyen*; Ital. *mesoblasto* (or *mesoderma*). This term, which is practically synonymous with mesoderm, was introduced by F. M. Balfour, and is used chiefly in England. See EMBRYO, and MESODERM. It has been used with other special meanings by German writers. O. Hertwig employs it as a synonym of mesothelium; others have applied it to the parent cells of the mesoderm. These latter usages have never become current.

Literature: FOSTER and BALFOUR, *Introd. to Embryol.* (1st ed.); F. M. BALFOUR, *Compar. Embryol.* (1881). See also MESODERM. (C.S.M.)

Mesoderm [Gr. μέσος, middle, + δέρμα, skin]: Ger. *Mesoderm, mittleres Keimblatt*; Fr. *mésoderme, feuillet moyen*; Ital. *mesoderma* (or *foglietto mediano*). The middle germ-layer, or that germ-layer from which are derived those tissues which are not developed from the ectoderm on the outside or the endoderm on the inside.

It develops later than the ectoderm and endoderm, and may arise from either or both of these primary layers. It very early differ-

entiates itself into two primary tissues—MESENCHYMA, and MESOTHELIUM (q. v.).

The middle germ-layer was first clearly recognized by von Baer (1829), who called the outer sheet *Fleischschicht*, the inner sheet *Gefässschicht*. Remak gave the final demonstration that these two sheets are parts of a single germ-layer.

Literature: C. E. VON BAER, *Entwicklungsgesch.*; REMAK, *Untersuchungen über die Entwicklung d. Wirbelthiere* (1850–5); MINOT, *Human Embryol.*, 166; and the literature of EMBRYOLOGY (q. v.). (C.S.M.—E.S.G.)

Mesognathous (Skull): see PROGNATHISM.

Mesothelium [Gr. μέσος, middle, + θηλή, a nipple]: Ger. *Mesothel*; Fr. *mésothélium*; Ital. *mesotelio*. Applied by Minot to the epithelium lining the primitive body-cavity of the embryo. It includes all the non-mesenchymal portions of the MESODERM (q. v.). During the embryonic period the mesothelium is differentiated into the permanent lining of the body-cavity, into the so-called segments from which the striated muscles arise, and into the rudiments (Anlagen) of the urogenital system.

The word is indefensible etymologically, but is a convenient addition to the terms derived from *θηλή*. Epithelium was first introduced as a name for the layer covering the nipple, and its application was soon extended to all layers conforming to the same type of histological structure, and in this wide sense epithelium is now universally used. Endothelium was introduced by His for epithelia lining all internal cavities, and similarly mesothelium was introduced by Minot for the epithelium lining the body cavity and derived from the middle germ-layer. These epithelia constitute morphologically a distinct group of tissues. (C.S.M.)

Messiah [Heb. *Mashiah*, from *mashah*, to anoint]: Ger. *Messias*; Fr. *Messie*; Ital. *Messia*. The name used in the Hebrew Scriptures to designate the promised Redeemer of the Jewish nation, who was to come in the fullness of time and deliver his people from all their temporal and spiritual enemies. The Messiah is the Christos of the New Testament and was identified with Jesus as the promised Saviour.

The Messiah was the child of promise and covenant engagement. Of the seed of Abraham and the stock of David, he was to unite in his person the threefold offices of prophet, priest, and king, and was to reign over an actual theocracy. The idea of the Messiah

has a marked development in the Old Testament. At first he is to be merely a temporal deliverer, but in the later prophets he has assumed more than human proportions, and is represented as the spiritual redeemer of his people. Jesus Christ as the Messiah stands as the spiritual regenerator and Saviour of humanity. (A.T.O.)

Messianic Hope: Ger. *Hoffnung auf den Messias*; Fr. *espérance messianique*; Ital. *aspettazione messianica*. The expectation of the Jewish people, nourished by covenant promise and prophecy, of a golden age of material and spiritual prosperity under the personal reign of a MESSIAH (q. v.), who should unite in himself the offices of prophet, priest, and king.

The Messianic hope was the inspiring motive of Old Testament prophecy and the persistent ideal which gave unity to Jewish history. It was the kindler of an inextinguishable aspiration which has been able to survive even the rejection of Christ and is entertained by at least a portion of the Jewish people at the present day. What is called Reformed Judaism has dropped the Messianic feature from its creed.

Literature: BRIGGS, *Messianic Prophecy*; ORELLI, *Old Testament Prophecy*; DELITZSCH, *Messianic Prophecy*, &c.; DRUMMOND, *The Jewish Messiah* (1877); A. EDELSHEIM, *Prophecy and Hist. in relation to Messiah* (1885). (A.T.O.)

Metabolism [Gr. μεταβολή, a change]: Ger. *Metabolismus*, *Stoffwechsel*; Fr. *métabolisme*, *échanges nutritifs*; Ital. *metabolismo*. The sum of the changes, constructive and destructive, which go on in living bodies.

Food material, on the one side, is built up to form living protoplasm of muscle, gland, nerve, or other tissue. This constructive phase of metabolism is termed ANABOLISM (q. v.) or ASSIMILATION (q. v.). On the other hand, living protoplasm, in the process of breaking down into simpler, dead compounds, yields the energy by which the organism does its work, these processes being grouped under the term KATABOLISM (q. v.). 'Assimilation and disassimilation, or anabolism and katabolism, go hand in hand, and together constitute an ever-recurring cycle of activity, which persists as long as the material retains its living structure, and which as a whole is designated under the name metabolism' (Howell's *Textbook*, as below).

Metabolism of plants, aided by the energy of sunlight, is chiefly anabolic, constructing

inorganic substances into living protoplasm, or into proteids, carbohydrates, and fats. Animal protoplasm, on the other hand, is chiefly katabolic, turning these food materials to simpler compounds, principally to water, carbonic acid, and urea.

Literature: the textbooks of physiology, especially HOWELL, Amer. *Textbook of Physiol.* (C.F.H.)

Metagenesis [Gr. μετά + γένεσις, production]: Ger. *Metagenese*; Fr. *métagenèse*; Ital. *metagenesi*. A form of ALTERNATION OF GENERATIONS (q. v.) among invertebrates, chiefly among coelenterates and vermes. The term was introduced by Owen to mark the distinction from metamorphosis.

The essential facts of this phenomenon are the production of a first generation of individuals by the ordinary sexual processes, and the production of a second generation by asexual processes. Individuals of the second generation propagate sexually, but their offspring belong to types of the first generation. The relations are often further complicated: first, through the unlikeness of two generations in structure; second, through the increase in the number of asexual generations. For example: many jelly-fish deposit eggs, which develop into hydroid individuals, and these multiply by transverse division and produce medusoid individuals, like the original parent; tape-worms lay eggs, which produce the so-called larval young, and these multiply asexually (as in *Coenurus*), producing a second generation of sexually active tape-worms.

Literature: KORSCHULT and HEIDER, *Entwicklungsgesch. d. Wirbellosen*; PARKER and HASWELL, *Zoology*, i. See also under ALTERNATION OF GENERATIONS. (C.S.M.)

Metakinesis: see KINESIS, and MIND-DUST THEORY.

Metamere [Gr. μετά + μέρος, a part]: Ger. *Metamer*; Fr. *métamère*; Ital. *metamero*. A SEGMENT (q. v.) of the body. (C.S.M.)

Metamorphopsia [Gr. μεταμόρφωσις, change, + ὤψ, eye]: Ger. *Metamorphopsie*; Fr. *métamorphopsie*; Ital. *metamorfopsia* (suggested—E.M.). If a piece of the retina, through a wound or through some pathological condition, is detached from its normal situation and still retains its sensibility to light, the space-qualé (surface-qualé) of the light-sense will also be retained. The detached portion may have grown on again in a different place, or, since it is nourished chiefly from in front, it may continue to function for some time in spite of being detached (*solutio retinae*, detachment

of the retina), although it is no longer in correct correspondence with the outer world nor with the space-reports of the other eye. Such errors of local sense are called metamorphopsiae. They occur also in the cutaneous local sense, if a piece of translocated skin retains its vitality—as it may do when it is not entirely cut off, but rotated about a narrow non-detached portion as a stem. Both in the case of the skin and in that of the retina, a correct local sense is gradually recovered. This has been taken as showing that the spatial attribute of the visual sense is not direct, but indirect; if we saw yellow where we should see green, we could not educate ourselves into thinking that the sensation was green; it is only in the case of a sensation entering consciousness merely as a sign for another sensation that re-education is possible. More recent observations show, however, that in the case of the skin there is no retention of space-sense unless the connecting stem of skin is retained; hence the old space-sense may be preserved by means of nerve-fibres which pass through this stem, and the new may be regained only after the new nervous connections have grown up. But this view would not seem to take account of the retinal cases, for there the nervous connections grow out from the front, and have not been, at least in cases of *solutio retinae*, broken off at all, and hence the recovery (not the error) would here be difficult to account for, except when it can be supposed that the retina has returned to exactly its original position. The subject is in much need of careful revision, as it has been made a crucial feature in theories of the space-sense. Wundt himself has experienced the distortion in one of his eyes.

Literature: WUNDT, *Physiol. Psychol.* (4th ed.), ii. 102; LEBER, in Graefe u. Saemisch, *Handb. d. Augenh.*, v (2), 612, 619, and literature there given; STRANSKY, *Biol. Centralbl.* (1900).

(C.L.F.)

Metamorphosis [Gr. *μετά*, change, + *μορφή*, form]: Ger. *Metamorphose*; Fr. *métamorphose*; Ital. *metamorfosi*. A considerable change of form, sufficient to affect its general appearance and characteristics, occurring more or less abruptly during the development of an individual.

The change of a LARVA (q. v.) into a CHRY-SALIS (q. v.), or of a chrysalis into an IMAGO (q. v.), is a metamorphosis. The term is not applied to a gradual transformation, as of the embryo into an adult.

ARD, *Entomology*; COMSTOCK, *Entomology*; LUBBOCK, *Origin and Metamorphoses of Insects* (1874); F. M. BALFOUR, *Compar. Embryol.* (1881); D. SHARP, art. *Insecta*, in *Camb. Nat. Hist.*

(C.S.M.—E.S.G.)

Metaphysics [Gr. *μετά* + *φυσικά*, things physical or natural]: Ger. *Metaphysik*; Fr. *métaphysique*; Ital. *metafisica*. Owes its name to the editorial arrangement of Aristotle's treatise on the subject by Andronicus of Rhodes (cir. 63 B.C.), who placed it after the treatise on physics, with the general super-scription *τὰ μετὰ τὰ φυσικά*. Aristotle's own name for the discussions contained in it was 'First Philosophy' or 'Theology,' and from his description of them as concerned with the nature of 'being as being,' the later term ONTOLOGY (q. v.) was coined. The name *Metaphysica* first appears—as a singular noun—in Averroes and the scholastics of the 13th century.

The term has proved an unfortunate one, as suggesting that the science is divorced from experience and concerned altogether with the transcendent. Kant is responsible for spreading this idea of metaphysics by his repeated descriptions of it as a science of assertions about the transcendent, a science, moreover, involved in a series of inevitable self-contradictions. He certainly had historical ground for his strictures upon the old metaphysic, if we take Wolff's definition of it as 'the science of all that is possible, so far as it is possible'—a science supposed to be evolved by analysis from the logical principle of identity or contradiction. Metaphysics was divided by Wolff into a general part (ontology), which treats of the most abstract determinations of being in general, whether corporeal or spiritual, and three special parts (rational cosmology, rational psychology, and rational theology), named according to their principal subjects (the world, the soul, and God). These latter disciplines form the subject of Kant's attack in the *Dialectic*, and in contrast with the Wolffian metaphysics he gives his own idea of the science of metaphysics, as the only science which admits of completion: 'This science is nothing more than the inventory of all that is given us by pure reason, systematically arranged.' To this science the *Critique*, as the doctrine of the limits of pure reason, was designed to form an introduction. According to this Kantian usage, metaphysics would become synonymous with EPISTEMOLOGY (q. v.) or with a part of that science.

Wolff's system represents, however, neither the best modern nor the old Aristotelian con-

ception of philosophy. Metaphysics, as the central philosophical discipline, might rather be defined as simply the systematic interpretation of experience and the explication of all its implicates. The implicates of experience cannot be described—in any condemnatory sense at least—as ‘beyond’ experience; although, doubtless, the result of metaphysical analysis may be to show the impossibility of identifying experience with the isolated particulars of sensationalistic philosophy. If experience be taken without any such arbitrary limitation of its meaning, metaphysics seeks simply to harmonize or rationalize experience, i. e. to exhibit it as a system or interconnected whole. Metaphysics, as William James pithily puts it, ‘means only an unusually obstinate attempt to think clearly and consistently’ (*Textbook of Psychol.*, 461); or, as Plato expressed it, it is the effort to think things together—not in isolation and abstraction, but in relation to one another, and as parts or aspects of one concrete whole. The different sciences are all ‘abstract,’ because each starts with certain presuppositions or working postulates which give true results within the limits of the science itself, but which are found on critical examination to be full of obscurity and contradiction, if offered as true in the full sense of that term, namely, as giving a finally intelligible explanation of the experience in question. Metaphysics aims at correcting the abstractions of the different sciences, and relating them to one another, reaching thereby an expression of the concrete truth of experience as such. The truth, however, which metaphysics seeks to reach—even when presented under the questionable designation of absolute truth—does not really transcend experience in any other sense than that in which the whole transcends its parts.

Metaphysics, in this sense, must obviously coincide to a large extent with epistemology, conceived as ‘criticism of categories,’ or with logic in the Hegelian sense; and accordingly the most convenient usage (and that most in harmony with the history of the term) is probably to regard metaphysics—the theory of knowing and being—as the wider term, including as its two subdivisions or aspects epistemology and ontology. The latter term would then be used to signify what is the culmination of metaphysical effort, a synthetic statement in ultimate terms of the nature of the real, so far as that is attainable from the human standpoint. But the disuse of the term ontology in current philosophical

writing has led to a considerable variety of usage in regard to the term metaphysics, which is still further increased, of course, by the divergences of philosophical creed in the writers. Many writers of positivistic and Neo-Kantian tendencies, attaching to metaphysics the old associations of transcendency, deny the possibility of the science, and put epistemology, or analysis of conceptions, in its place. Others, on the contrary, Hegelian in general tendency, associate epistemology solely with subjectivistic attempts, of a Kantian or sceptical kind, to pronounce on the validity of thought as such, and deny in consequence the possibility of such a science; but they would apparently apply the term metaphysics to an analysis of conceptions much resembling what the former set of writers include under the head of epistemology. Among recent English writers, it may be noted that both Shadworth Hodgson and Laurie use metaphysics very nearly as equivalent to epistemology, but the former finds it necessary to supplement this investigation by what he calls ‘the constructive branch of philosophy’ (cf. *Philos. of Reflection*, chap. xi), while the latter indicates a distinction between this ‘analytic,’ or metaphysic considered as a demonstrative science, and what he calls ‘speculation’ or ‘a synthetic cosmic construction on the basis of the preceding analytic’ (cf. *Met. Nova et Velusta*, 284, 2nd ed.). Perhaps the commonest usage at the present day, and one that has much in its favour, is to use metaphysics in a narrower sense as opposed to epistemology, in which case it corresponds with the definition of ontology given above. In this sense it is used, for example, by Paulsen, Külpe, and Volkelt, the most recent authors of Introductions to Philosophy. Külpe points out that if the analysis of knowledge and its conceptions be excluded from its sphere, there still remains as the task of metaphysics proper ‘the development of a Weltanschauung.’ In essaying this task, he proceeds, metaphysics is based upon practical motives on the one hand, and, on the other, upon the demand for a completion of scientific knowledge which shall be free from contradictions. In a sense, any such view of the world as a whole may be said to transcend the fragmentary data at our disposal. Within the domain of the sciences, which start from certain hypotheses, demonstration and verification of particular propositions may be possible, on the assumption of these hypotheses; but metaphysics, in rising

to its supreme hypotheses or postulates, can obviously never hope to offer demonstration or verification in the same sense. It is one thing, as Volkelt puts it, 'to postulate supreme principles of a certain nature, that is, starting from the facts of experience to declare that the solution of certain problems can lie only in the direction of certain fundamental thoughts; it is something quite different to exhibit everything individual as arising, so to speak, out of the highest principles, and explainable from the inner necessity of these principles.' In very similar words, at the conclusion of his *Metaphysics*, Lotze expresses his profound conviction of 'the living and active meaning of the world,' but adds: 'We do not know this meaning in its fullness, and therefore we cannot deduce from it what we can only attempt, in one universal conviction, to retrace to it.' This is, indeed, the main difference between the pretentious metaphysics of the Wolffian type and the more modest attitude of present-day thinkers. (A.S.P.P.)

If the last-mentioned usage be adopted—which seems advisable—we have the term PHILOSOPHY (q.v.) to include both epistemology and ontology (metaphysics).

Literature: that of philosophy generally, see BIBLIOG. B, 1, c; also for special periods and authors, BIBLIOG. A, 1, 2; see also the Histories of Philosophy, and the Introductions to Philosophy (BIBLIOG. A, 1, and B, 1 a). For contemporary works see the annual lists issued by the Arch. f. system. Philos., 1 ff. Other bibliographies are listed in the vol. (iii) of bibliographies, GENERAL, 1. (J.M.B.)

Metapsychosis: see TELEPATHY.

Metayer System [Med. Lat. *medietarius*]: Ger. *Halbpachtsystem*, *Metawirthschaft*; Fr. *métayage*; Ital. *mezzadria*. Farming on share rent; especially in those countries where the class of mediarii has had a continuous existence. The share is not necessarily one-half; in Tuscany, as a rule, the metayer receives two-thirds.

In England the commutation of the feudal labour dues was made into a small fixed money payment, which put the occupier almost into the position of an owner. In the Romance countries the change was not so complete; and in Italy, specifically, the nobles were powerful enough to insist on the receipt of shares of the produce, which left the cultivator far short of a position of independence. (A.T.H.)

Metazoon [Gr. *μετά* + *ζῷον*, an animal]: Ger. *Metazoon*; Fr. *métazoaire*; Ital. *metazoo*, *metazoario*. An animal consisting of several or

many cells differentiated into tissues, as opposed to a protozoon, which consists of a single cell.

The term was introduced by Haeckel in his *Generelle Morphologie*, 1867. It includes all animals excepting the Protozoa. (C.S.M.)

Metempirical [Gr. *μετά* + *ἐμπειρία*, experience]: Ger. *metempirisch*; Fr. *métémpirique*; Ital. *metempirico*. A term due to George Henry Lewes, and used by him in a sense almost exactly equivalent to the Kantian use of transcendent—that which is not verifiable within the bounds of possible experience.

'Since we are to rise to metaphysics through science, we must never forsake the method of science; and further, if in conformity with inductive principles we are never to invoke aid from any source higher than experience, we must, perforce, discard all inquiries whatever which transcend the ascertained or ascertainable data of experience. Hence the necessity for a new word which will clearly designate this discarded remainder—a word which must characterize the nature of the inquiries rejected. If, then, the *empirical* designates the province we include within the range of science, the province we exclude may fitly be styled the *metempirical*' (Lewes, *Problems of Life and Mind*, 1st series, 16). In Barratt's *Physical Metempiric* the term is used in a wider sense, which makes it include whatever cannot literally become part of the subjective experience or consciousness of any given person. In this sense it is made to include the existence of other conscious persons who are, in Clifford's phrase, 'ejects' or mental constructs to explain certain features of subjective experience, not themselves parts of that experience as a psychological process. But the current sense of the term is that attached to it by its inventor. (A.S.P.P.)

Metempsychosis [Gr. *μετά* + *ἐμψυχούν*, to animate]: Ger. *Metempsychose*, *Seelenwanderung*; Fr. *métempsychose*; Ital. *metempsychosi*, *transmigrazione*. The transmigration of the soul from one bodily form, human or animal, into another.

This is one of the earliest forms in which the doctrine of the immortality and pre-existence of the soul appears, and is probably connected with the primitive theory of a kinship or blood-relationship between man and beasts (cf. Burnet, *Early Greek Philos.*, 100). Herodotus (ii. 123) derives the belief from Egypt: 'The Egyptians are the first who propounded the theory that the human soul is immortal, and that when the body of any one perishes, it enters into some other

creature that may be born ready to receive it, and that when it has gone the round of all created forms in land, in water, and in air, it once more re-enters a human body born for it; and this cycle of existence takes place in 3,000 years.' Metempsychosis is one of the best-authenticated parts of the teaching of Pythagoras, with whose name it has continued to be specially associated. Plato does not exactly teach the doctrine dogmatically, but avails himself of it in the mythical presentations of his thought. By him it is connected with a law of moral retribution. The details vary, and it is difficult to say how far any of them are taken seriously by Plato (cf. *Phaedrus*, 249; *Republic*, x. 614 f.). In the myths of the *Gorgias* and the *Phaedo* the doctrine does not appear. (A.S.P.P.)

Besides its prominence in Orphic, Pythagorean, and Egyptian teaching, metempsychosis is a tenet of Indian, Jewish (Cabbala), and Swedenborgian philosophy. It is interesting to note a tendency in current discussion of the immortality of the soul to recur to the hypothesis of pre-existence, as following from the arguments which are urged in support of post-mortem personal existence. The poetry of Plato's doctrine of 'reminiscence' (*ἀνάμνησις*) reappears also, as in Wordsworth's *Intimations of Immortality*. Yet it is difficult to call that a future life in any vital sense which is thought of as being disconnected with this life, as this is with a possible earlier life.

-meter (apparatus ending in): see LABORATORY AND APPARATUS, III, E.

Method [Lat. *methodus*; Gr. *μέθοδος*, from *μετά* + *ὁδός*, way]: Ger. *Methode*; Fr. *méthode*; Ital. *metodo*. See the topics immediately following; also PSYCHOPHYSICAL METHODS, and SCIENTIFIC METHOD.

Method and Methodology, or Methodo-deutic: Ger. *Methodenlehre*; Fr. *méthodologie, théorie de la méthode*; Ital. *teoria dei metodi, metodologia*. A branch of logic which teaches the general principles which ought to guide an inquiry.

Owing to general causes, logic always must be far behind the practice of leading minds. Moreover, for the last three centuries thought has been conducted in laboratories, in the field, or otherwise in the face of the facts, while chairs of logic have been filled by men who breathe the atmosphere of the seminary. The consequence is that we can appeal to few works as showing what methodology ought to be. The first book of Bacon's *Novum*

Organum is well enough, as far as it goes, and was no doubt useful in its day. Senebier's *L'Art d'observer* is instructive. Comte's *Philosophie positive* accomplished something. Whewell's *History of the Inductive Sciences* and other works have the advantage of being written by a man of great power of investigation, himself, who drew his doctrine from the facts of scientific history. Mill's *System of Logic* is, no doubt, of considerable value, although the author knew too little of science. There is hardly one of the illustrations of fine method adduced in his first edition which has not been refuted. Beneke's *Logik in praktischer Absicht* was not altogether without value. Of great value, also, is Jevons' *Principles of Science*. Pearson's *Grammar of Science* is a work of great force, but unfortunately too much influenced by certain philosophical ideas. Wundt devotes two of the three volumes of his *Logik* to *Methodenlehre*.

The traditional doctrine of method is confined chiefly to rules of definition and division, which teach an exactness of thought much needed, but are marked by the total absence of modern ideas. Cf. SCIENTIFIC METHOD, and EVIDENCE. (C.S.P.)

Method (in education). An orderly procedure in teaching; a systematic way of teaching and training.

Methods of teaching depend, in a last analysis, upon the acts of mind involved in sense experience and thought. First impressions are prone to inadequacy and even incorrectness. They must be reinforced by drafts upon the stored-up experience of the mind—anticipations of what we may look for in the complete identification of the object. After objects are fully identified, we seek to find their universal properties. In thus making the complete survey of an object of knowledge three steps are involved: (a) preliminary apperception or identification; (b) reinforcement of present by past experience; (c) advance to generalization. In acquisition, therefore, three things are involved: namely, apperceptive identification, deductions of anticipations for further identification, generalization by inductive processes. These are the essential steps of an adequate method. They may be recognized in the terms observation, deduction, induction. When the emphasis is laid on the first, we have the so-called method of observation; when on the second, that of deduction; when on the third, that of induction.

The variety and combination possible in

these fundamental stages of method are numerous. Thus, if we arrive at generalizations through catechetical means, we speak of the Socratic method. The Herbartians emphasize (1) the apperception of observed facts, (2) the inductive approach to generalization, (3) the deductive application of these generalizations to appropriate new particulars. From the standpoint of the teacher, we have the lecture method (the monologue); the developing, catechetical or Socratic method (the dialogue). With regard to the thing learned, we may begin with the whole and proceed to the parts (analytical method), or we may begin with the parts and proceed to the whole (synthetical method). In either of these cases the three fundamental stages (observation, deduction, and induction) are to be traced. With regard to the learner, knowledge must be acquired in accordance with the fundamental forms of thought, which are (1) the conception, (2) the judgment, (3) the syllogism.

Most Herbartian writers name what they conceive to be five essential stages or steps in a correct method, as follows:—

(1) *Preparation*. This consists of a brief preliminary review of such acquired knowledge or experience as will best fit the child's mind for a rapid and interested appropriation of the new matter about to be presented. (2) *Presentation* of the new lesson. (3) *Association*. This stage provides for more complete apperception of the facts of the new lesson, by associating them intimately with related facts already acquired. (4) *Generalization*. This stage gathers up the facts of the lesson in such a manner that their deeper inner significance may be grasped by the pupil. In many studies these generalizations appear in the form of definitions, rules, principles, laws, maxims, &c. (5) *Application*. By this stage is meant those drill and practical exercises which tend to fix knowledge in mind, and to secure a facile application of it to practical affairs. As may easily be seen, these stages are but an amplification of observation, deduction, and induction, the three logical steps found in all experience and thinking.

Literature: BAIN, *Educ. as a Sci.*, 230–357; ROSENKRANZ, *Philos. of Educ.*, 90–105; HERBART, *Sci. of Educ.* (trans. by Filkin), 154–86; TOMPKINS, *Philos. of Teaching*, 73–275; McMURRY, *The Method of the Recitation*; DE GARMO, *Essentials of Method*. (C. DE G.)

Methods of Ethics: Ger. *Methoden der Ethik*; Fr. *méthodes de morale*; Ital. *metodi dell' etica*. The rational modes of procedure

for determining what is morally right or reasonable and what the reverse.

In his *Methods of Ethics* (1874) H. Sidgwick distinguishes the different methods which seem *prima facie* reasonable, and then develops and applies each so as to bring out the system of moral judgments to which it leads. He defines a 'method of ethics' as 'any rational procedure by which we determine right conduct or practice in any particular case.' The expression was given currency by him. (W.R.S.)

Methodentic: see METHOD AND METHODOLOGY.

Methodical Selection. A term used by Darwin for a form of ARTIFICIAL SELECTION (q. v.). (J.M.B.)

Methodology: see METHOD AND METHODOLOGY.

Method-whole: Ger. *methodische Einheit*; Fr. (not in use); Ital. *unità metodica* (suggested—E.M.) A portion of the subject-matter of instruction to which the formal steps or stages of instruction conveniently apply.

Herbartian writers on method advocate the subdivision of the subject-matter of instruction into minor wholes or unities, so that with each group there may be (1) the acquisition of new facts, (2) an inductive organization of these facts into general truths, and (3) a deductive application of the generalizations to new sets of allied facts. The aim of each group is the leading purpose for which it is taught; the stages in the treatment of the method-whole are the 'formal steps' of instruction. See METHOD (in education), and FORMAL STEPS.

Literature: ZILLER, *Allg. Päd.*, 294; DE GARMO, *Essentials of Method*, chap. vi; McMURRY, *The Method of the Recitation*, chap. xii. (C. DE G.)

Metronymic (or **Mat-**) [Gr. μήτηρ, mother, + ὄνομα, name]: Ger. *metronymisch*; Fr. *métronymique*; Ital. *matronimico*. (1) Noun. A name derived from the name or description of the mother or other female ancestor. (2) Adj. Applied to the female line of descent, marked by the perpetuation of mother names to the exclusion of father names. (3) Adj. Tracing descent through mothers, e. g. a metronymic clan.

(1) Used by Freeman (*Norman Conquest*, v. 380) to characterize certain personal names surviving in England before and after the Norman Conquest. (2) Used by Réclus (*Primitive Folk*, 157) of the early customs of Egypt. (3) Used in systematic sociology by

Giddings (*Princ. of Sociol.*), instead of the term matriarchal. (F.H.G.)

Meyer's Experiment: Ger. *Meyer'scher Versuch*; Fr. *expérience de Meyer*; Ital. *esperienza del Meyer*. An experiment in visual contrast. Lay on a coloured field a small piece of grey paper, and cover the whole with white tissue-paper. The colour complementary to the field spreads over the grey. The vividness of the effect is due not to the diminution of saturation but to the blurring of the outline of the grey. Cf. CONTRAST (visual, simultaneous).

Literature: H. MEYER, Pogg. Ann. (1855), xiv. 170; HELMHOLTZ, Physiol. Optik (2nd ed.), 547; EBBINGHAUS, Psychologie, 221; SANFORD, Course in Exper. Psychol., expt. 152 c. (E.B.T.)

Meynert, Theodor. (1833-92.) Educated at Vienna. Privatdocent in brain anatomy, 1865; prosecutor of the Vienna Insane Asylum, 1866; director of the Psychiatric Clinic, and assistant professor of psychiatry in the University, 1870; professor of neurology, 1873; privy councillor, 1885. President of the Psychiatric Association, vice-president of the Vienna Medical Society, and member of the Imperial Academy of Sciences.

Michelet, Karl Ludwig. (1801-93.) Studied law and, later, philosophy at Berlin; assistant professor of philosophy there, 1829. He is sometimes classed as one of the 'older' Hegelians, one of the right wing.

Microcephalic [Gr. *μικρός*, small, + *κεφαλή*, head]: Ger. *mikrocephal*; Fr. *microcéphale*; Ital. *microcefalo*. Having an abnormally small head, or one below a certain standard; in the adult less than 431 mm. or 17 inches in circumference, or 1,350 c.c. capacity of the cranium.

The deficiency mainly affects the brain, and is proportionally most marked in the hemispheres. Microcephalic persons are almost always of defective intelligence, and are frequently idiots of extreme types. Only a small percentage of idiots, however, are microcephalic. The causes of this condition are obscure; the frequency with which the sutures of microcephalic skulls are found closed is significant. Extreme cases of microcephaly have attracted attention from ancient times to the present. Cf. IDIOCY. (J.J.)

Literature: W. W. IRELAND, Idiocy (with literature); VOGT, Les Microcéphales ou Hommes-singes (1867); GIACOMINI, Cervelli dei Microcefali (1890). (J.J.—E.M.)

Microcosm: see MACROCOSM.

Micro-organism [Gr. *μικρός*, small, + *ὄργανον*, an instrument]: Ger. *Mikroorganismus*; Fr. *micro-organisme*; Ital. *microorganismo*. An organism too small to be visible to the naked eye. Chiefly applied to the lowest fungi, but occasionally to some of the Protozoa. Cf. UNICELLULAR ORGANISMS. (C.S.M.)

Mid- [AS. *midde*]. The median. See MEAN AND MEDIAN.

Used, in various compounds, in the terminology introduced by F. Galton (*Natural Inheritance*) for the mathematical treatment of problems of heredity. Mid-stature: 'the median [stature] of the general population' (ibid. 92). Mid-parent: 'an ideal [supposed] person of composite sex whose stature [e.g.] is halfway between the stature of the father and the transmuted stature of the mother' (ibid. 87; transmuted meaning increased by the amount requisite to make female comparable with male stature, ibid. 56). Mid-error: probable error (ibid. 58); cf. ERRORS OF OBSERVATION. (J.M.B.)

Mid-parent: see MID-.

Middle Term (and Middle) [trans. of *terminus medius, medium*, used by Boethius to translate Aristotle's *ὁ μέσος ὅρος, τὸ μέσον*]: Ger. *Mittelbegriff*; Fr. *terme moyen*; Ital. *mezzo termine, termine medio*. The adjective *μέσος* is applied in Greek to a third object additional to two others, when the idea of intervening can hardly be detected. It is, therefore, perhaps needless to seek further for Aristotle's intention in calling that term, by the consideration of which two others are illatively brought into one proposition as its subject and predicate, the middle term, or middle. It is the most important factor of Aristotle's theory of reasoning.

The same word means little more than third in the phrase 'principle of excluded middle,' which is, indeed, often called *principium exclusi tertii*. See LAWS OF THOUGHT. On the other hand, something which partakes of each of two disparate natures, and renders them capable of influencing one another, is called a *tertium quid* (Aristotle's *ἡ τρίτη οὐσία*). (C.S.P., C.L.F.)

Migraine or Megrin [Gr. *ἡμικρανία*, half-headed]: Ger. *Migräne*; Fr. *migraine*; Ital. *emicrania*. A severe headache, almost invariably confined to one side of the head (hence also termed hemicrania), and accompanied by the symptoms described below. The tendency to migraine, which is popularly known as 'sick-headache,' is often inherited.

It is most apt to appear in youth, and ordi-

narily diminishes or disappears towards middle life. In many cases the attack is preceded by a premonitory period, in which disordered sensations occur, such as dizziness, restlessness, or peculiar visual disturbances. See the

Fig. 1.

Fig. 2.

Fig. 3.

Optical symptom in migraine (Figs. 1-3). *O*, point of fixation in centre of left hand held laterally 18 in. before the eyes. *AB*, length of hand. *Oz*, direction of development of symptom (in left upper quadrant). Fig. 1. Initial stage, true size (about), only symptom of any sort present. Fig. 2. Maximum stage, accompanied by massive headache and beginning of nausea. Fig. 3. Final stage (before rapid fading); violent more localized headache and nausea. (In Figs. 2 and 3, *AO* equals *AB* of Fig. 1.) Duration of symptom, 1 to 1½ hours. Symptom is invariable for recurrent attacks, and for monocular (either eye) and binocular vision, and has a fluttering wavy movement which cannot be figured.

figures 1-3, drawn from his own symptoms by Baldwin (*Science*, May 4, 1900), who thinks the progress of the stigmat indicates the development of the disturbance in the optical centres or connecting-fibres. The attacks are irregularly periodic, and may be induced by overwork, worry, indigestion, eye-strain, and other causes. The typical symptoms begin with a dull headache, which tends to increase, becomes burning, boring, or piercing, and overpowering in intensity, with continued visual symptoms—such as floating spectres, 'fortification' patterns (as in the figures)—vaso-motor and digestive disturbances, and vomiting. With absolute repose the symptoms, which may last from several hours to several days, gradually subside. Migraine is regarded as a significant symptom in the delineations of nervous instability when it occurs in connection with serious nervous and mental disorders. It is a functional central disturbance, but several views are entertained as to its exact seat.

Literature: LIVEING, Megrim, Sick-headache, &c. (1873); for good accounts, with full citation of literature, see Real-Encyc. der gesammten Heilkunde (1897); MOEBIUS, Nothnagel's Spez. Path. u. Ther., xii; WOOD'S Ref. Handb. of the Med. Sci., sub verbo. (J.J.)

Miletus (school of). Comprises the philosophers of Miletus, THALES, ANAXIMANDER, ANAXIMENES. See these names; and cf. PRE-SOCRATIC PHILOSOPHY. (J.M.B.)

Milieu [Fr.]. ENVIRONMENT (q. v., also for equivalents in other languages).

Used as a biological term by Lamarck (*Philos. Zool.*, 1809, ii. 4 ff.), and by Comte (*Syst. de politique positive*, vi. 574) who expanded the meaning by the phrase milieu intellectuel, and applied in sociology by Taine. Cf. Barth, *Philos. d. Gesch. als Sociol.*, i. 33. (J.M.B.—F.H.G.)

Mill, James. (1773-1836.) Born at Logie Pert, Forfarshire, Scotland. Educated at Edinburgh, he was licensed to preach in the Church of Scotland, 1798, but soon abandoned the ministry. Tutor in the family of Sir John Stuart. Moved to London, 1800, and became an author. Held an important position in the office of the East India Company. He is called the founder of English ASSOCIATIONISM (q. v.), through his work, *An Analysis of the Phenomena of the Human Mind*.

Mill, John Stuart. (1806-73.) Born in London. Son of JAMES MILL (q. v.), who directed his education. The year 1820 was spent mostly in the south of France. Studied

law with John Austin, a disciple of Bentham. Entered the service of the East India Company in 1823, and remained connected with it until 1856. He was the chief conductor of the *Westminster Review*, 1835-40. Member of Parliament, 1865. His life after 1856 was chiefly directed to literary pursuits. Member of the Académie des Sciences Morales, and noted for his contributions to logic (see INDUCTION) and ETHICS (q.v.); see also UTILITARIANISM. On James and J. S. Mill, a late work is Stephen, *The English Utilitarians*, i, ii.

Millenarianism [Lat. *mille*, thousand, + *annus*, year]: Ger. *Lehre von dem tausend-jährigen Reich*; Fr. *doctrine du millénium*; Ital. *dottrina dei millenarii*. The doctrine of the personal reign of Jesus Christ upon earth, under which the powers of evil are to be restrained and the principles of Christianity to become completely and universally prevalent.

The germ of the doctrine is found in the Messianic hope, which prefigured a golden age of temporal as well as spiritual prosperity. The first coming of Christ only partially realized this hope. Hence the expectation, nourished by some of the sayings of Jesus, and especially by the prophecy of John in the Apocalypse, of a second advent at some time in the future, and the re-presentation, under very dramatic circumstances, of a *régime* under which Christianity should completely triumph. The time of its consummation and the period of its continuance is confessedly indefinite.

Literature: A. HARNACK, *Encyc. Brit.*, art. Millennium; SCHÜRER, *Lehrb. d. neutestamentlichen Zeit-Gesch.* (1881), §§ 28, 29; CARRODI, *Krit. Gesch. d. Chiasmus*. (A.T.O.)

Millennium [Lat. *mille*, thousand, + *annus*, year]: Ger. *Millennium*; Fr. *règne millénaire*; Ital. (il) *Millennio*. A supposed period either before or after the second coming or advent of Christ, sometimes limited to one thousand years, during which the kingdom of God will be established on earth. Cf. CHILIASM. (J.M.B.)

Mimāṁsā Philosophy: see ORIENTAL PHILOSOPHY (India).

Mimetism [Gr. *μιμῆσις*, imitation]: Ger. (1) *Nachahmung* (imitation), *nachahmend* (mimetic), (2) *Nachäffung*, *Mimik*; Fr. *mimétisme*; Ital. (1) *mimetismo*, (2) *mimesi*. (1) Those forms of (mimetic) RESEMBLANCE (q.v.) and of IMITATION (q.v.) in which that which is resembled (the 'copy') is itself a factor in the production of that which resembles it, and including the imitation of a copy consciously set up as a model. This meaning is

recommended as part of the scheme of connotation given in the table under RESEMBLANCE.

(2) A particular case of (1): the mimetic condition of certain patients or of minds of a low order which express themselves largely in pantomime, mimicry, more or less slavish and impulsive copying of what they see and hear. The absence of even this power (in the sense 2) gives the defect called AMIMIA (q.v.).

The term *mimetism* is recognized in pathology, being already established in French and Italian. Other instances are LALLING (q.v.), plastic IMITATION (q.v.) or social CONTAGION (q.v.), states of consciousness generally which are associated with what is called CIRCULAR (or repeating) REACTION (q.v.), and the 'inner imitation' of aesthetic theory (see Hirn, *Origins of Art*, 98, who has adopted the word *Mimetism*). Cf. SEMBLANCE.

Another important case falling under the definition (1) is biological MIMICRY (q.v.), understood as including all the various forms of biologically produced mimetic resemblance.

For literature see the topics referred to, especially IMITATION. (J.M.B., G.F.S.)

Mimicry (in biology) [Gr. *μιμικός*]: Ger. (English term); Fr. *mimétisme*; Ital. *mimetismo*, *mimesi*. The term *mimicry* is generally used to express a resemblance, independent of affinity, between certain species inhabiting the same country—a resemblance which appeals to the senses of other animals, especially to the sense of sight, not uncommonly to hearing, occasionally to smell and touch.

The term is often extended to include the likeness of animals to their environment for the purpose of concealment from enemies or prey (protective and aggressive, or procryptic and anticryptic resemblance). These latter extremely numerous cases of resemblance are more conveniently kept separate, although they have much in common with those included under mimicry. H. W. Bates, who was the first to offer a feasible explanation of mimicry (*Linn. Soc. Trans.*, xxiii, 1868), used the term in its extended sense, but has not been followed by Fritz Müller, Wallace, Trimen, Meldola, Poulton, Dixey, and others who have contributed to the subject. The essential difference between mimicry and protective resemblance will appear below.

Even the definition given in the first paragraph is too wide, and includes at least four distinct kinds of resemblance, to only one of which the term *mimicry* in its scientific sense is strictly applicable.

(1) Visible resemblances, independent of

affinity, are brought about by similarity of function. The resemblance of form between the greyhound and the racehorse, or between the carnivorous marsupial *Thylacynus* and a true Carnivor, such as the dog, are to be thus explained. A still more striking example is the appearance of a mole-like form as an adaptation to mole-like habits in three distinct orders of mammalia—the Insectivora, Rodentia, and Marsupialia. Such resemblances were called by Darwin 'analogical' or 'adaptive.' Cf. CONVERGENCE (in biology), and ORGANIC SELECTION (2).

In order to fall into line with the terminology suggested for mimicry and its allies, the term *syntechnic*, with the noun *syntechné* (from σύν, together, and τέχνη, art, employment, profession), has been formed for the writer by Arthur Sidgwick, to express these results of functions in common.

Careful analysis of the anatomical basis of the resemblances in question will show that they are secondary, being merely an incidental result of the functions which are common to the similar forms, and thus very different from mimicry in which the resemblances are primary and have been brought about for their own sake.

(2) Visible resemblances are not only brought about by adaptation to similar dynamic conditions, but also to similar static conditions. Thus many insects resemble lichen or bark, and therefore incidentally resemble each other. Equally good examples are to be found among the distantly related caterpillars which resemble each other because of their likeness to the pine-needles or grasses on which they feed. Here, too, the resemblances between the species are secondary, being the incidental results of 'common protective or aggressive resemblance,' or, as they may be called, to follow the same terminology, *syncryptic* (σύν, together, and κρυπτός, hidden), the noun being *syncrypse*; together with *synprocryptic* and *synanticryptic*, according as the common resemblance to surroundings is for the purpose of defence or attack.

(3) Visible resemblances are also produced by 'common warning or synaposematic colours,' in which specially defended animals gain advantage by a common advertisement. The resemblances between butterflies believed to be nauseous was pointed out by H. W. Bates (loc. cit.); but the explanation was due to Fritz Müller (*Kosmos*, May, 1879, 100), who pointed out the saving of life which would result from a common appearance in the period

during which youthful enemies are being educated to avoid the distasteful or dangerous forms having a similar appearance. This class of resemblance has much in common with mimicry, and is often called 'Müllerian mimicry.' It has also been spoken of as 'mimicry between protected species,' but it is clear that its true position is in the group of WARNING COLOURS (q. v.).

(4) Finally, we have the resemblance of a species which is not specially protected to one which gains comparative immunity from the possession of some unusual mode of defence.

In this case, the latter is called the model and the former the mimic. Mimicry thus becomes a case of 'false warning and signalling or pseudosematic colours,' and is distinguished from protective (and aggressive) resemblance, because in the latter an animal resembles something which is of no interest to its enemies (or prey), and is thus concealed; while in the former it resembles (pseudaposematic) something which its enemy positively fears or dislikes (or conversely—pseudepise-matic—which its prey positively desires or seeks), and thus becomes conspicuous. There are cases, however, in which not very conspicuous models are mimicked, as in the likeness of the dipterous insect *Eristalis* to the bee.

The resemblances of mimicry are superficial, but deep-rooted structural changes are often necessary in order to bring them about. Thus resemblances of habit and attitude are as characteristic of mimicry as resemblances of form. The use of the term mimicry, which sometimes implies conscious IMITATION (q. v.), has been a fruitful source of confusion. According to the theory suggested by Bates, the resemblances are due to the operation of natural selection, which preserves the variations which tend in the direction of the model and are thus mistaken for unpalatable or dangerous forms, and eliminates others. Cf. CONVERGENCE. (E.B.P.)

The following classification shows the relation of mimicry to the other uses of the colours of animals, according to Poulton:—

I. APATETIC COLOURS.

A. *Cryptic colours*.

1. *Procryptic*. Protective resemblances
2. *Anticryptic*. Aggressive resemblances.

B. *Pseudosematic colours*.

1. *Pseudaposematic*. Protective mimicry (Batesian).
2. *Pseudepise-matic*. Aggressive mimicry and alluring colours.

II. SEMATIC COLOURS.

1. *Aposematic*. Warning colours.
2. *Synaposematic*. Common warning colours in different species (Müllerian mimicry).
3. *Episematic*. Recognition markings.

III. EPIGAMIC COLOURS. Colours displayed in courtship.

In opposition to a theory of mimicry based on natural selection exclusively the following possibilities have been suggested:—

(1) That the similar direct action of the environment may produce similar effects on different organisms during their individual lives.

(2) That internal developmental causes may lead to similar organic products either directly (cf. ORTHOGENESIS) or indirectly.

(3) That the psychical influence of predominating types of colour and pattern may lead to a preference for these types, rendered effective in heredity through sexual selection of those organisms in which these types are developed.

(4) That there may be (a) a direct physiological response to constant mental experiences, such as sensations of colour, working in both the species in question, and giving mimetic results; or (b) direct conscious imitation in habits, &c. (e.g. in the securing of food), which produce such physiological effects. A psychological view was held by Erasmus Darwin, 1794 (*Zoonomia*, 297; cited by Delage).

(5) It has been held (Plateau, *Bull. de l'Acad. Roy. de Belg.*, 3^e sér., xxiii. No. 2; also Delage, *Structure du Protoplasma*, 377) that the phenomena are simply coincidences.

In discussing the subject the following points should be borne in mind: first, that the resemblances in question are superficial; second, that they are often found in the female sex only; and third, that they are produced by organic changes, which occur in very diverse ways.

Mimicry (in psychology): Ger. *Mimik*; Fr. *mimique*; Ital. *mimica*. The phenomena described under MIMETISM (2) (q.v.), particularly those of plastic Imitation (q.v.). (J.M.B., G.F.S.)

Mind (in philosophy) [Lat. *mens*]: Ger. *Geist*; Fr. *esprit*; Ital. *spirito*. Used in general antithesis to matter, to cover that phase of reality which does not permit of exclusive interpretation in terms of matter in motion, but allows or requires the hypothesis of something analogous to conscious process.

The older use included specifically the attributes of personal consciousness, as in the controversy on TELEOLOGY (q.v.), where 'mind in nature' really meant mind outside of nature, which showed its power, design, &c., in the creation and ordering of nature. This ascription of consciousness to mind shows itself in Leibnitz's monads, which have the power of 'presentation,' and in the development of Cartesianism, culminating in the dualism of the attributes of extension and thought of Spinoza. Spinoza's substance, however, may possibly be considered—at least logically—the mediating doctrine from this more anthropomorphic earlier meaning to the various later idealistic uses of the term. In recent idealism the contrast, viewed empirically, is between mechanism and mind; and the latter is anything which is left over in nature—increased organization, teleological progress, &c.—after mechanical explanations have exhausted themselves, and which the analogy from conscious process may be called upon to explain. These idealistic theories vary greatly the creationism which holds that mind produces but is not itself mechanism; the transcendent, immanent view which makes mind partly immanent in nature and partly apart from it; the identity view which allows full sweep to mechanical explanations but holds that nature may be reinterpreted as mind; and finally, the view of the Hegelian 'absolute' mind (*Geist*), which is the reconciliation and unity of 'subjective' (conscious) mind and 'objective' mind (mechanical nature). In

the more immanent systems, mind—for which thought and spirit are interchangeably used—becomes a sort of limiting notion or explaining category, at the same time that its concrete determination in terms of consciousness is denied or not attempted. Hegel's 'thought,' Schopenhauer's 'will,' Bradley's 'sentience,' are each in its way similarly a limiting notion of some one phase of mind thus understood. Cf. SOUL, SPIRIT, and the next topic. For the various philosophers' usage see numerous citations in Eisler, *Wörterb. d. philos. Begriffe*, 'Geist,' 'Seele.' (J.M.B., J.D.)

Mind (in psychology) [Lat. *mens*]: Ger. *Seele*; Fr. *esprit*; Ital. *mente*. The individual's conscious process, together with the dispositions and predispositions which condition it. It is thus the individual's consciousness, with its capabilities; its capabilities including all faculties, powers, capacities, aptitudes, and dispositions, acquired and innate. (G.F.S.—J.M.B.)

The necessity of including both clauses of the definition is seen in the fact that the subjective and objective determinations of mind do not run entirely parallel. Subjectively, we have everything conscious, and nothing else mental; objectively, we have to ask whether all the phenomena which seem to afford evidence of mind, by resembling the performances of consciousness, really do involve consciousness. The objective question, Is consciousness coextensive with mind? is often answered in the negative; and it is forcing its way into the psychological theories in the form of the hypothesis of unconscious mental modifications, dispositions, &c. Mind looked at objectively must include phenomena which are present when consciousness is present; but there may be a deeper aspect of intelligence, feeling, or will (each has been held) than that form which shows itself in individual consciousness. The definition should at any rate leave open the discussion of this possibility, together with the possible recognition of those factors, themselves not in personal consciousness, without which, however, the flow of consciousness would not be what it is.

For the relation of mind to SOUL and SPIRIT, the definitions given under those topics may be compared with this one. Mind has become the psychological word for the phenomenally presented or immediately given series of changes occurring in consciousness and in time. Soul has come to be limited to a mental substance in some way existing as a permanent unity behind the phenomena of

mind. Spirit is largely confined to theological writers, who use it either as synonymous with soul or attempt a distinction according to which spirit is a sort of second soul which is the bearer of the higher ideal, intuitive, ethical, and religious faculties or functions. For the usage in the foreign languages cf. PNEUMA, PSYCHE, SOUL, and SPIRIT, and see TERMINOLOGY, German, 'Geist,' and French, 'Âme'; and for classical usage (Lat. *mens*, *anima*, *spiritus*; and Gr. *ψυχή*, *νοῦς*, *πνεῦμα*) consult the respective indices in Vol. ii. For more philosophical usages see MIND (in philosophy), and SPIRIT.

Literature: see the general treatises on PSYCHOLOGY and EPISTEMOLOGY, and the titles in BIBLIOG. G, 2, o. (J.M.B.)

Mind and Body: Ger. *Körper und Geist*; Fr. *le corps et l'esprit*; Ital. *corpo e spirito*. The phrase used currently to indicate the problem of the sort of reality which is to be attributed to mind and body respectively in relation to each other.

Every philosophical theory finds itself face to face with this question; and certain of the profoundest solutions date back to Greek thought (Anaxagoras' theory of the *νοῦς*—see NOUS—and the view of Aristotle as given under MATTER AND FORM, and as involved in the distinction between *δύναμις* and *ἐνέργεια*—see POWER). The various theories now current reflect essentially different ways of approaching the question, and their presuppositions are so different that it is only with respect to their conclusions that they can be compared with one another. There is, first of all, the class of dualistic theories—holding to the assumption of two real forms of existence, mind and body, and asking how and to what extent these two real existences can stand in relation to each other. These theories may be divided into the epistemological and the genetic, the former finding its basis in a dualism of knowledge of mind and body respectively, and the latter in the actual distinction of the two as formulated in the history of culture, and in the naïve progress of the individual's mental development. Under the former head we have the *influxus physicus* or CAUSE THEORY (q.v.), psychophysical PARALLELISM (q.v.), the theories of PRE-ESTABLISHED HARMONY (q.v.), and OCCASIONALISM (q.v.). Genetic theories, on the other hand, hold either to a dualism which is necessary in the evolution of human thought, and for this and other reasons also valid, or make this dualism a matter merely of naïve

thinking, necessary for a practical view of the world, but open to criticism. Here we find the discussions of INTROJECTION (q. v.), EJECTION (q. v.), &c.—attempts to trace the rise and progress of the antithesis between mind and body.

The second great class, the monistic theories, are, for the most part, philosophical, resulting in their turn either from a refutation of dualism in epistemology, or a transcending of the genetic dualism of naïve thought. Under the former we have the idealistic theories generally, including those of spiritual MONISM (q. v.), PANPSYCHISM (q. v.), and MIND-DUST (q. v.); the materialistic theories, including the EPIPHENOMENON (q. v.) and AUTOMATON (q. v.) theories (see AUTOMATIC AND AUTOMATISM), and the DOUBLE ASPECT THEORY (q. v.), which, while agnostic in its attitude towards the monistic principle, nevertheless denies dualism in principle.

The logical alternatives of the case are not exhausted, however, as between dualism of body *and* mind, on the one hand, and monism of body *or* mind on the other hand; that is, it is not necessary logically to hold that we must believe either that consciousness modifies the brain processes and so violates the law of conservation of energy—giving two interacting realities—or that consciousness is an epiphenomenon and the psychophysical individual an automaton. This reduction of the possible views to two is unnecessary and illogical. In speaking of the antecedents of a voluntary movement—the case whose interpretation brings up the whole question—we have to consider the entire group of phenomenal events which are always there when voluntary movement takes place; and among the phenomena really there, the conscious state called volition is really there. To say that the same movement could take place without this state of consciousness is to say that a lesser group of phenomenal antecedents occurs in some cases and a larger group in other cases of the same event. Why not go to the other extreme, and say that the brain is not necessary to voluntary movement, since volition could bring about the movement without using the nervous processes to do it with? In his posthumous book on *Mind, Matter, and Monism*, Romanes brings out this inadequacy of the automaton view, using the figure of an electro-magnet, which attracts iron-filings only when it is magnetized by the current of electricity. Whatever the electricity be, the magnet is a magnet only when it

attracts iron-filings; to say that it might do as much without the electricity would be to deny that it is a magnet; and the proof is found simply in the fact that it does not attract iron-filings when the current is not there. So the brain is not a brain when consciousness is not there; it could not produce voluntary movement because, as a matter of fact, it simply does not. So consciousness does not, on the other hand, produce movement without a brain.

The whole difficulty seems to lie in the inadequate analysis which limits the cause to the physical changes preceding the movement. Such a conception as physical causation cannot be applied beyond the sphere of things in which it has become the explaining principle—i.e. in the objective, external world of things. The moment we ask questions concerning a group of phenomena which include more than these things, that moment we are liable to some new statement of the law of change in the group as a whole. Such a statement is the *third alternative* in this case additional to dualism of mind and body and monism of either.

The other extreme is represented by those writers who think that the revision of the law of causation can be made in the sphere of objective phenomenal action represented by the brain; and so claim that there is a violation of the principle of conservation of energy in a voluntary movement, an actual efficiency of some kind in consciousness itself for producing physical effects—the dualistic view. This is as illegitimate as the other. It seems to deny the results of all objective empirical science, and so to sweep away on one side the statements of law on which the higher interpretation of the group of phenomena as a whole must be based. And it does it in favour of an equally empirical statement of law on the other side. It is not easy to see how any result for the more complex system of events can be reached if we deny the only principles which we have in the partial groups. To do so is to attempt to interpret the objective in terms of the subjective factor in the entire group; and we reach by so doing a result which is just as partial as that which the epiphenomenon theory reaches in its mechanical explanation. Lotze made this mistake, but his hesitations on the subject showed that he appreciated the difficulty. The claim of these writers that the mechanical view of causation cannot be used as an adequate explaining principle of the

whole personality of man seems good; but for reasons of much the same kind, it seems equally true that as long as we are talking of events of the external kind, i.e. of brain processes, we cannot deny what we know of these events as such, and give such knowledge no place in our final interpretation.

The general state of the problem may be shown by the accompanying diagram, which will at any rate serve the modest purpose of indicating the alternatives. The upper line of the two parallels may represent the statements on the psychological side which mental science has a right to make respecting the determination of mental change; the lower of the parallels may represent the corresponding series of statements made by physics and natural science, including the chemistry and physiology of the brain. Where they stop, an upright line may be drawn to indicate the setting of the problem of interpretation, in which both series of statements claim to be true; and the further line to the right then gives the phenomena and statements of them which we have to deal with when we come to consider man as a whole. Now our point is that we cannot deny either of the parallel lines in dealing with the phenomena of the single line to the right, nor can we take either of them as a sufficient statement of the further problem which the line to the right proposes. To take the line representing the mechanical principles of nature, and extend it alone beyond the upright, is to throw out of nature the whole series of phenomena which belong in the upper parallel line and do not lend themselves to statement in mechanical terms. And to extend the upper line alone beyond the upright is to allow that mechanical principles break down even in their own sphere, for the brain is a part of nature even when accompanied by a mind.

As to the interpretation of the single line to the right, it may always remain the problem that it now is. The best we can do is to get points of view regarding it; and the main progress of philosophy seems to be in getting an adequate sense of the conditions of the problem itself. From the more humble side of psychology, the growth of consciousness

itself may teach us how the problem comes to be set in the form of seemingly irreconcilable antinomies, and this it is the merit of the genetic theories to have recognized. The person grows both in body and mind, and this growth has to have two sides—the side facing towards the past, the ‘retrospective reference,’ which embodies all determinations already made, and the side facing the future, the ‘prospective reference’ of growth, and of the consciousness of growth which anticipates further determination. The positive sciences have by their very nature to face backward, to look retrospectively, to be ‘descriptive’—these give the lower of our parallel lines. The moral sciences, so called, on the other hand, deal with judgments, appreciations, organizations, expectations, and so represent the other, the ‘prospective’ mental attitude and its corresponding aspects of reality. This gives character largely to the upper one of our parallel lines. But to get a construction of the third line, the one to the right, is to ask for both these points of view at once; to stand at both ends of the line—at a point where description takes the place of prophecy, and where reality has nothing further to add to thought.

This third alternative is, accordingly, to think psychophysical change in a category under which both mechanical processes and ideal changes—the realization of ends and values—are present at once. And the problem becomes that of the interpretation of the world in general; how can a mechanical system be also teleological?—the issue of philosophy in which all the others are pooled, and on the general solution of which that of this problem must depend.

A question which is much discussed concerns the actual physiological process correlated with consciousness—that of the ‘physical basis of consciousness’—but with little more than speculative results. Cf. the textbooks of psychology.

Literature: see the topics cited. Recent discussions are STUMPF, Pres. Address, Dritter int. Congr. f. Psychol. (1897), 3; WENTSCHER, Physische u. psychische Kausalität (1896); BERGMANN, Seele u. Leib, Arch. f. syst. Philos., iv. (1898) 401, and v. 25; REHMKE, Aussenwelt u. Innenwelt (1898); SCHWARZ, Verhältniss v. Leib u. Seele (1897); BUSSE, Zeitsch. f. Philos. u. phil. Kr., cxiv. (1899) 1; RICKERT, in Sigwart-Abhandlungen (1900); discussion by JAMES, LADD, BALDWIN, in Psychol. Rev., iii (1896). (J.M.B.)

Mind Cure: Ger. *Psychotherapie*; Fr. *guérison par la foi* (no exact equivalent—T.H.F.); Ital. *cura psichica* (or *morale*). A variety of systems, appearing in different ages, heralded under diverse auspices, and practised in adherence to special forms and theories, which have in common the element of curing disease mainly by mental influence.

Terminology in this field is embarrassing in its abundance and misleading in its special connotations. Three lines of interest may be distinguished with reference to this large subject. (1) The first relates to the proper interpretations of actual cures or relief effected by the influence of the mind on the body, and to the practical utilization of such influence in the scientific treatment of disease. This division of the subject is considered under the term **PSYCHOTHERAPEUTICS** (q.v.). (2) The historical and anthropological interest is centred in the accounts of cures by mental methods in past eras and among primitive peoples. At all times and in all stages of medical knowledge the cure of disease has not been wholly by physical means, but an appeal has been made to the patient's mental co-operation, either directly or more usually indirectly, by rites and ceremonies, by charms and mystic procedures, by exorcism and religious appeals and prayers, by pilgrimages to places of special sanctity or renown. A very important part of the life of primitive peoples is concerned with such practices; but their specific consideration would require an extensive treatment. The history of cures by the action of mind or faith is likewise a long one, and includes such diverse practices as the cure by the king's touch, the healing touch of divinely gifted persons, the action of charms and amulets, the efficacy of shrines and relics, of exorcism, prayers, and religious devotion, the elaborate procedures of mesmerism in its several forms (see **HYPNOTISM**), of 'electric tractors,' electro-biology, and an endless series of devices, cures, and systems. What is common to these various methods is that their success depends largely upon the judiciously excited belief and co-operation of the patient.

Literature, to (2): MAX BARTELS, *Med. d. Naturvölker* (1893); TYLOR, *Primitive Culture*; ELWORTHY, *Evil Eye* (1895); REGNAULT, *La Sorcellerie* (1897); ANDREW D. WHITE, *Hist. of Warfare of Sci. with Theol.* See also the references under **FOLK-LORE**, **DEMONOMANIA**, and **MAGIC**.

(3) To be specially classified are the systems

which are established upon the doctrine that mental treatment is the sole or main factor in the cure of bodily ills. Such systems are mainly of recent origin and are known by various names: 'mind cure,' 'faith cure,' 'mental healing,' 'Christian science,' 'metaphysical healing,' &c. 'Christian science,' due to Mrs. Mary B. Eddy (see her book *Science and Health*, 1866-1900), has probably achieved the widest fame. Some of these systems are based upon strained interpretations of the world of matter; they teach the unreality of disease, the divine origin of health, the neglect of bodily symptoms as unreal, and the like. Ignoring or misinterpreting, as they do, the tenets of physiology and psychology, such systems must be pronounced essentially unscientific; and the practices which arise from them are liable to lead to serious injury. On the other hand, the importance of utilizing in a judicious and properly subordinated form the element which such systems set forth in an exaggerated and perverted fashion is being more generally recognized by the medical practitioner. Kant's *Von der Macht des Gemüths* contains early suggestions. Cf. **PSYCHOTHERAPEUTICS**.

Literature: FERNALD, *Pop. Sci. Mo.*, xxxiv, 798; PURRINGTON, *Christ. Sci.* (1900); BUCKLEY, *Christ. Sci.* and other Superstitions (1899); GODDARD, *Effects of Mind on Body*, *Amer. J. of Psychol.*, x, 431; JASTROW, 'The Modern Occult,' in *Fact and Fable in Psychol.* (1900). (J.J.)

Mind-dust Theory: Ger. *Theorie der psychischen Atomen*; Fr. *théorie des atomes mentaux*; Ital. *teoria degl' elementi psichici, atomismo psichico*. The **COMPOSITION THEORY** (q.v.) of mind in the form which holds that there are particles or atoms ('dust') of mind everywhere in nature, accompanying material atoms, and on suitable occasions forming the 'stuff' of conscious mind as postulated by the **MIND-STUFF THEORY** (q.v.). It may be called 'psychological atomism' in contrast with the psychic or mental atomism of the composition theory. For a recent statement, see Münsterberg, *Psychol. Rev.*, vii, 1900, 1.

Ll. Morgan has postulated what he calls 'metakinesis,' something higher than 'kinesis' (matter in motion), as analogous in the inorganic world to consciousness in the organic.

Literature: see under **MIND-STUFF THEORY**, and **COMPOSITION THEORY**; especially SPENCER, *Princ. of Psychol.*, i. §§ 179, 195; JAMES, *Princ. of Psychol.*, chap. vi (with many citations); also ROMANES, *Mind, Matter, and Monism*;

LL. MORGAN, *Nature*, xlv. 319; KARL PEARSON, *Grammar of Sci.*, 2nd ed., chap. ix; ARDIGÒ, *L'Unità della Coscienza*; UEBERWEG-HEINZE, *Hist. of Philos.*, III. ii. 419. (J.M.B.)

Mind Reading: see MUSCLE READING, and TELEPATHY.

Mind-stuff Theory: Ger. *Theorie des psychischen Stoffes* (or *der Seelenzellen*, Haeckel); Fr. *théorie de la matière mentale* (no exact equivalent—T.R.F.); Ital. *teoria della materia psichica* (or *mente-sostanza*). The COMPOSITION THEORY (q. v.) of mind combined with a further speculation: it is assumed that the ultimate units which enter into the composition of mental states constitute also what appears to us as matter. The elements of mind-stuff are thus a form of psychical MONAD (q. v.).

Literature: the phrase Mind-stuff Theory was first used by W. K. CLIFFORD in *Mind* (O.S.), iii. 57. The best reference is JAMES, *Princ. of Psychol.*, i. 159, who cites (with many others) G. T. FECHNER, *Psychophysik*, ii. chap. xlv; H. TAINE, *On Intelligence*, Bk. III; E. HAECKEL, *Zellseelen u. Seelenzellen*, in *Gesammelte pop. Vorträge* (1st ed.), 143; J. SOURY, art. *Hylozoismus*, in *Kosmos*, 5. Jahrg., H. 10, 241; WHITTAKER, *Mind* (O.S.), vi. 498 (historical); MORTON PRINCE, *The Nature of Mind and Human Automatism* (1885); A. RIEHL, *Der philosophische Kriticismus*, ii., Theil 2, II. Abschnitt, 2. Cap. (1887); ROYCE, *Mind* (O.S.), vi. 376. See also COMPOSITION THEORY. (G.F.S.—J.M.B.)

Minimum divisible [Lat.]. The quantity which, the result of successive division, is itself indivisible. See DIVISIBILITY. (J.M.B.)

Minimum (or Minimal) Sensation: see LIMITS OF SENSATION.

Minor [Lat. *minor*, the lesser]: Ger. *Moll*; Fr. *mineur*; Ital. *minore*. One of the two fundamental scales or keys of modern music characterized by the presence of the minor third above the fundamental.

Expressed in 'whole tones,' it runs: Harmonic form: 1, 1-2, 1, 1, 1-2, 1 and 1-2, 1-2. Melodic form, ascending: 1, 1-2, 1, 1, 1, 1, 1-2; descending, 1, 1, 1-2, 1, 1, 1-2, 1. Cf. Helmholtz, *Sensations of Tone* (Eng. trans.), 274, 288; Cummings, *Rudiments of Music*, 47. For minor intervals, &c., see MAJOR. (E.B.T.)

Minor (in logic): see MAJOR AND MINOR.

Minucius Felix: see PATRISTIC PHILOSOPHY (4).

Mirabaud, Jean-Baptiste de. (1674-1760.) Born in Paris and intended for the

army, he became the friend of La Fontaine, and was won over to the study of literature. He became a member of the Oratory, and soon afterwards secretary of the duchess of Orleans and the instructor of her daughter. A translation of Tasso's *Jerusalem Delivered* secured for him entrance into the Academy, and in 1742 he became its perpetual secretary.

Miracle [Lat. *miraculum*, a wonder]: Ger. *Wunder*; Fr. *miracle*; Ital. *miracolo*. An event which, on account of its unusual character, is assumed to be beyond the recognized powers of nature and man, and therefore the product or manifestation of supernatural agency, of which it also serves as a sign and witness.

The miracle is a part of the system of supernaturalism, and stands or falls with it. Assuming the possibility of a miracle, the questions of fact and of definition remain. Believers in supernatural religion accept the fact, and are only interested in the question of the true conception of a miracle. The early and mediaeval theologians agree in conceiving the miraculous as being above but not contrary to nature. The question entered on a new phase when Hume defined a miracle as a violation of nature, and asserted the impossibility of substantiating its actual occurrence. The modern discussion has proceeded largely in view of Hume's destructive criticism. The miracle as a part of the Christian scheme is held to be an attestation of the supernatural claims of Christianity, though opinions differ as to its evidential value. Early designations of the miracle were wonder (*σημείον*) and prodigy.

Literature: HUME, *Essays*, ii; R. WARDLAW, *Miracles* (N. Y., 1853); BUSHNELL, *Nature and the Supernatural*; BADEN POWELL, *The Order of Nature* (London, 1859); J. MCCOSH, *The Supernatural in relation to the Natural* (London, 1862); J. KÖSTLIN, *De Miraculorum quae Christus, &c.* (1860); G. P. FISHER, *Grounds of Theistic and Christian Belief* (1883). (A.T.O.)

Mirror Writing: Ger. *Spiegelschrift*; Fr. *écriture en miroir*; Ital. *scrittura a specchio*. Reversed handwriting as seen when ordinary writing is held before a mirror; it, in turn, becomes legible, as ordinary writing, when seen in a mirror. It may be produced by pressing clean blotting-paper on heavy writing when the ink is still wet.

Mirror writing is sometimes produced by young children whose writing is still forming;

seen fragmentarily in the reversal, and even the up-or-down-turning, of single letters, figures, &c., and in the writing with the left hand of many adults who write normally with the right hand. A simple test is: starting with both hands together before the body, trace one's autograph naturally with each index-finger in mid-air. In many cases of right-handed persons the left hand then inscribes mirror writing more naturally than correct writing, performing movements symmetrical with those of the right hand, rather than analogous to them; that is, moving away from the right hand rather than following it.

Mirror writing furnishes an important problem to theorists on HANDWRITING (q. v.). It is probably due in children to the incomplete association of the series of hand-movement sensations with the control series of visual sensations. In some the hand unaccustomed to writing reproduces the muscular series to which the other hand is accustomed (symmetrical accompanying movements); this is in persons who think of writing mainly in terms of the muscular sensation series. Others, who do not produce mirror writing, think on the contrary of the visual form of the words, and so reproduce that, giving a correct imitation of the other hand (analogous accompanying movements).

Literature: see HANDWRITING, GRAPHOLOGY, and Agraphia under SPEECH AND ITS DEFECTS. (J.M.B.)

Misdemeanour (in law) [OF. *mesdemener*]: Ger. *Vergehen*, *Uebelverhalten*; Fr. *délit*, and for petty offences *contravention* (*Code Pénal*, x); Ital. *contravvenzione*. A crime less than a felony; a minor offence. 'In common usage the word "crimes" is made to denote such offences as are of a deeper and more atrocious dye; while smaller faults and omissions of less consequence are comprised under the gentler name of "misdemeanours" only' (Blackstone's *Commentaries*, iv. 4). (S.E.B.)

Misology [Gr. *μισέειν*, to hate, + *λόγος*, reason]: Ger. *Misologie*; Fr. *misologie*; Ital. *misologia*. Hatred and despair of reason. Sometimes applied to intellectual PESSIMISM (q. v.). (J.M.B.)

Missing Link: the immediate ancestor of man. See ANTHROPOID, ad fin.

Mitosis [Gr. *μῖτρος*, a thread]: Ger. *Mitose*; Fr. *mitose*; Ital. *mitosi*. The indirect mode of nuclear division, to which the term karyokinesis is also applied.

The chromatin of the nucleus forms a thread, which breaks up into a number of separate

CHROMOSOMES (q. v.); these become split each into two halves, which travel to the opposite poles of the achromatic spindle (amphiaster), where they become reconstituted into the two daughter nuclei. Mitosis is the ordinary mode of nuclear division, and is found, with but little variation, in the cell division of the Protozoa and Metazoa, and of plants also. Cf. CELL THEORY (also for literature), AMITOSIS, and NUCLEUS. (E.S.G.)

Mixed [Lat. *mixtum*, from *miscere*, to mix]: Ger. *vermischt*; Fr. *composé*; Ital. *misto*. (1) Mixed proof: a proof which is partly analytic, partly synthetic.

(2) Mixed mode: a mode compounded of simple ideas of several kinds, put together to make one complex one (Locke, *Essay concerning Human Understanding*, Bk. II. chap. xii. § 5). See MODE.

(3) Mixed power: a power at once active and passive, because the principle of change is in itself. (C.S.P.)

Mixture (linguistic): Ger. *Mischung*; Fr. *mélange*; Ital. *mescolanza*, *miscela*. Applied to the results of the borrowing from one language to another of words or other speech-elements.

Languages influence each other through individuals speaking two or more languages. Words of one language are fitted into the sentence framework of another. An inflectional or formative element cannot be 'borrowed,' i.e. become a loan-element, unless enough words containing it are borrowed to fix such element as an independent existence in the consciousness of the speech-community. In bilingual communities it is noticed that the tendency is for a single sentence-mould to suffice for two languages. This tendency to use a single mould of syntax with various vocabularies has brought about the 'modernizing' of the syntax of all European languages. (B.I.W.)

Mnemonic Verses and Words (in logic). Aids to memory in logic, of the sort described under MNEMONICS (q. v.). (J.M.B.)

1. Instrumenta novem sunt, guttur, lingua, palatum

Quattuor et dentes, et duo labra simul.

The following mnemonic verses are contained in the *Summulae Logicales* of Petrus Hispanus, but were older, perhaps very much older.

2. 'Quae?' ca. vel hyp., 'Qualis?' ne. vel aff., u. 'Quanta?' univ. par. in. velsing. [What is the substance of a proposition? categorical or hypothetical. What is its quality? negative

or affirmative. What is its quantity? universal, particular, indefinite, or singular.]

3. Simpliciter Fecī, convertitur Evā per acci, Astō per contra: sic fit conversio tota.

Assertit *Ā*, negat *Ē*, sēd universaliter ambae;

Assertit *Ī*, negat *Ō*, sēd particulariter ambo.

[*E* and *I* are converted simply; *E* and *A*, per accidens; *A* and *O*, per contrapositionem.]

4. Prae, contradic.; post, contra.; prae postque, subalter.

Non omnis, quidam non; omnis non, quasi nullus;

Non nullus, quidam; sēd 'nullus non' valet 'omnis';

Non aliquis, nullus; 'non quidam non' valet 'omnis';

Non alter, neuter; 'neuter non' praestat 'uterque.'

[*Non* placed before *omnis* or *nullus* gives the contradictory proposition; placed after, the contrary; both before and after, the subalter-nate.]

5. Primus, Āmābīmūs; Ēdētūlī que, secundus;

Tertius, Īllīācē; Pūrpūrēā, reliquus.

Destruit ū totum, sēd ā confirmat utrumque;

Destruit ē dictum, destruit ī que modum.

Omne necessāriāt; impossibilē, quasi nullus;

Possibilē, quidam; quidam non, possibile non.

Ē dictum negat, ī que modum, nihil ā, sēd ū totum.

[The first syllable of each of the four vocables *Amābīmūs*, *Edentūlī*, *Illīācē*, *Purpurēā*, is for the possible mode; the second for the contingent; the third for the impossible; the fourth for the necessary. The vowel *a* signifies that both mode and 'dictum' are to be taken assertorically; *e*, that the dictum is to be denied; *i*, that the mode is to be denied; *u*, that both mode and dictum are to be denied. Each word refers to a line or order of equipollent modal forms.]

6. Tertius est quarto semper contrarius ordo.

Sit tibi linea subcontraria prima secundae.

Tertius est primo contradictorius ordo.

Pugnat cum quarto contradicendō secundus.

Prima subest quartae vice particularis habens se.

Hanc habet ad seriem se lege secunda sequentem.

[The relation of 'Sortem impossibile est currere' and 'Sortem necesse est currere' is that of contraries; they cannot be true at once. The relation 'Sortem possibile est currere' and 'Sortem possibile est non currere' is that of subcontraries; they cannot be false at once. The relation of 'Sortem possibile est currere' and 'Sortem impossibile est currere' is that of contradictories. The relation of 'Sortem possibile est non currere' and 'Sortem necesse est currere' is likewise that of contradictories. 'Sortem possibile est currere' follows from 'Sortem necesse est currere,' as does 'Sortem possibile est non currere' from 'Sortem impossibile est currere.']

7. Sub. prae. prima, secundā prae. bis, tertia sub. bis.

[The first figure contains the middle term as subject and predicate; the second, the middle as predicated twice; the third, the middle twice as subject.]

8. Bārbārā, Cēlārēnt, Dārī, Fērīō, Bārālipton,

Cēlāntēs, Dābītīs, Fāpēsēmō, Frīsēsōmōrum.

Cēsārē, Cāmestrēs, Fēstīnō, Bārōkō, Dārāpti,

Fēlāptōn, Dīsāmīs, Dātīsī, Bōkārdō, Fērison.

[These are original names of the syllogistic moods, which there is no sufficient reason for abandoning. The direct moods of the first figure are recognizable by their containing no sign of conversion, *s*, *p*, or *k*; the indirect moods (or moods of the fourth figure) by their having those signs attached either to the third vowel or to the first two. In the second figure, one of the signs *s*, *p* is attached to the first vowel, or to the second and third, or *k* is attached to the second. In the names of the moods of the third figure, *s* or *p* is attached to the second vowel, or to the first and third, or *k* to the first. There are also names for syllogisms with weakened conclusions or strengthened premises, as well as for indirect moods of the first figure considered as belonging to a fourth. But the above rules will enable a reader to identify them. Thus, *Bramantip* can be nothing but *Baralip-ton*; while *Barbari* is *Barbara* with a weakened conclusion. *Camenes* can be nothing but *Celantes*; *Dimaris* nothing but *Dabitis*; *Fesapo* nothing but *Fapesmo*; *Fresison* nothing but *Frisesorum*. A writer who introduces an *m* into the name of a mood containing an *s* or *p* only after its third vowel, or who omits *m* from the name of a mood

having *s* or *p* after the first and second vowels, uses the fourth figure.]

9. Simpliciter vult *s*, verti *p* verò per acci.

M vult transponi, *k* per impossibile duci.

Servat maiorem variatque secunda minorem;

Tertia maiorem variat servatque minorem.

[*s*, in the name of a mood, shows that the proposition denoted by the preceding vowel is, in a preferred mode of reduction, to be converted simply; *p*, that it is to be converted *per accidens*; *m* shows that the premises are to be transposed; *k*, that the preferred reduction is by reduction of the contradictory of the conclusion to an absurdity, this contradictory of the conclusion being, in the second figure, put in place of the minor premise (the major being retained), and in the third figure in the place of the major (the minor being retained).]

A great number of other memorial words and verses have been proposed by logicians.

(C.S.P.)

Mnemonics [Gr. *μνημονικός*, pertaining to memory]: Ger. *Mnemonic*, *Gedächtnisskunst*; Fr. *mnémotechnie*; Ital. *mnemonica*, *mnemotecnica*. Mnemonics or memoria technica is the art of memory, a code of rules for remembering. 'The method consists usually in a framework learned mechanically, of which the mind is supposed to remain in permanent and secure possession. Then, whatever is to be remembered is deliberately associated by some fanciful analogy or connection with some part of this framework, and this connection thenceforward helps its recall' (James, *Princ. of Psychol.*, i. 668).

(E.B.T.)

Mob [abb. of Lat. *mobilis*, mobile]: Ger. *Pöbel*; Fr. *populace*, *foule*; Ital. *plebaglia*. See CROWD. A 'rabble,' the most disreputable sort of mob, is designated in Ger. by *Gesindel*, in Fr. by *canaille*, and in Ital. by *marma-glia*.

(J.M.B., E.M.)

Mobility [Lat. *mobilis*]: Ger. *Beweglichkeit*; Fr. *mobilité*; Ital. *mobilità*. That property of matter by virtue of which it may change its position in space unless impeded by other matter.

(S.N.)

Modalism (in theology) [Lat. *modus*, manner]: Ger. *Modalismus*; Fr. *modalisme*; Ital. *modalismo*. The doctrine that the divine nature is unitary in both substance and personality, and that Father, Son, and Holy Spirit represent simply three different modes of temporal manifestation. See SABELLIANISM.

(A.T.O.)

Modality [Lat. *modus*; see MODE]: Ger. *Modalität*; Fr. *modalité*; Ital. *modalità*. There is no agreement among logicians as to what modality consists in; but it is the logical qualification of a proposition or its copula, or the corresponding qualification of a fact or its form, in the ways expressed by the modes *possibile*, *impossibile*, *contingens*, *necessarium*.

Any qualification of a predication is a mode; and Hamilton says (*Lects. on Logic*, xiv) that 'all logicians' call any proposition affected by a mode a modal proposition. This, however, is going much too far; for not only has the term usually been restricted in practice, from the age of Abelard, when it first appeared, until now, to propositions qualified by the four modes 'possible,' 'impossible,' 'necessary,' and 'contingent,' with only occasional extension to any others, but positive testimonies to that effect might be cited in abundance.

The simplest account of modality is the scholastic, according to which the necessary (or impossible) proposition is a sort of universal proposition; the possible (or contingent, in the sense of not necessary) proposition, a sort of particular proposition. That is, to assert '*A* must be true' is to assert not only that *A* is true, but that *all* propositions analogous to *A* are true; and to assert '*A* may be true' is to assert only that *some* proposition analogous to *A* is true. If it be asked what is here meant by analogous propositions, the answer is—all those of a certain class which the conveniences of reasoning establish. Or we may say the propositions analogous to *A* are all those propositions which in some conceivable state of ignorance would be indistinguishable from *A*. Error is to be put out of the question; only ignorance is to be considered. This ignorance will consist in its subject being unable to reject certain potentially hypothetical states of the universe, each absolutely determinate in every respect, but all of which are, in fact, false. The aggregate of these unrejected falsities constitute the 'range of possibility,' or better, 'of ignorance.' Were there no ignorance, this aggregate would be reduced to zero. The state of knowledge supposed is, in necessary propositions, usually fictitious, in possible propositions more often the actual state of the speaker. The necessary proposition asserts that, in the assumed state of knowledge, there is no case in the whole range of ignorance in which the proposition is false. In this sense it may be said that an impossibility underlies

every necessity. The possible proposition asserts that there is a case in which it is true.

Various subtleties are encountered in the study of modality. Thus, when the thinker's own state of knowledge is the one whose range of ignorance is in question, the judgments '*A* is true' and '*A* must be true' are not logically equivalent, the latter asserting a fact which the former does not assert, although the fact of its assertion affords direct and conclusive evidence of its truth. The two are analogous to '*A* is true' and '*A* is true, and I say so'; which are readily shown not to be logically equivalent by denying each, when we get '*A* is false' and 'If *A* is true, I do not say so.'

In the necessary particular proposition and the possible universal proposition there is sometimes a distinction between the 'composite' and 'divided' senses. 'Some *S* must be *P*,' taken in the composite sense, means that there is no case, in the whole range of ignorance, where some *S* or other is not *P*; but taken in the divided sense, it means that there is some *S* which same *S* remains *P* throughout the whole range of ignorance. So 'Whatever *S* there may be may be *P*,' taken in the composite sense, means that there is, in the range of ignorance, some hypothetical state of things (or it may be the unidentifiable true state, though this can hardly be the only such case) in which there either is no *S*, or every *S* there is is *P*; while in the divided sense, it means that there is no *S* at all in any hypothetical state but what in some hypothetical state or other is *P*. When there is any such distinction, the divided sense asserts more than the composite in necessary particular propositions, and less in possible universal. But in most cases the individuals do not remain identifiable throughout the range of possibility, when the distinction falls to the ground. It never applies to necessary universal propositions or to possible particular propositions.

Some logicians say that '*S* may be *P*' is not a proposition at all, for it asserts nothing. But if it asserted nothing, no state of facts could falsify it, and consequently the denial of it would be absurd. Now let *S* be 'some self-contradictory proposition,' and let *P* be 'true.' Then the possible proposition is 'Some self-contradictory proposition may be true,' and its denial is 'No self-contradictory proposition can be true,' which can hardly be pronounced absurd. It is true that those logicians usually take the form '*S* may be *P*'

in the copulative sense '*S* may be *P*, and *S* may not be *P*,' but this only makes it assert *more*, not *less*. The possible proposition, then, is a proposition. It not only must be admitted among logical forms, if they are to be adequate to represent all the facts of logic, but it plays a particularly important part in the theory of science. See SCIENTIFIC METHOD. At the same time, according to the view of modality now under consideration, necessary and possible propositions are equipollent with certain assertory propositions; so that they do not differ from assertory propositions as universal and particular propositions differ from one another, but rather somewhat as hypothetical (i.e. conditional, copulative, and disjunctive), categorical, and relative propositions differ from one another—perhaps not quite so much.

According to this view, logically necessary and possible propositions relate to what might be known, without any knowledge whatever of the universe of discourse, but only with a perfectly distinct understanding of the meanings of words; geometrically necessary and possible propositions, to what a knowledge of the properties of space does or does not exclude; physical necessity, to what a knowledge of certain principles of physics does or does not exclude, &c. But when we say that of two collections one must be correspondentially greater than the other, but each cannot be correspondentially greater than the other, it has not been shown how this kind of necessity can be explained on the above principles.

The earliest theory of modality is Aristotle's, whose philosophy, indeed, consists mainly in a theory of modality. The student of Aristotle usually begins with the *Categories*; and the first thing that strikes him is the author's unconsciousness of any distinction between grammar and metaphysics, between modes of signifying and modes of being. When he comes to the *metaphysical* books, he finds that this is not so much an oversight as an assumed axiom; and that the whole philosophy regards the existing universe as a performance which has taken its rise from an antecedent ability. It is only in special cases that Aristotle distinguishes between a possibility and an ability, between a necessity and a constraint. In this, he is perhaps nearer the truth than the system of equipollencies set forth above.

Kant seems to have been the first to throw any light upon the subject. To the old dis-

inction between logical and real possibility and necessity, he applied two new pairs of terms, analytic and synthetic, and subjective and objective. The following definitions (where every word is studied) certainly advanced the subject greatly:—

‘1. Was mit den formalen Bedingungen der Erfahrung (der Anschauung und den Begriffen nach) übereinkommt, ist *möglich*.

‘2. Was mit den materialen Bedingungen der Erfahrung (der Empfindung) zusammenhängt, ist *wirklich*.

‘3. Dessen Zusammenhang mit dem Wirklichen nach allgemeinen Bedingungen der Erfahrung bestimmt ist, ist (existirt) *notwendig*’ (*Krit. d. reinen Vernunft*, 1st ed., 219).

Kant holds that all the general metaphysical conceptions applicable to experience are capable of being represented as in a diagram, by means of the image of time. Such diagrams he calls ‘schemata.’ The schema of the possible he makes to be the figure of anything at any instant. The schema of necessity is the figure of anything lasting through all time (*ibid.*, 144, 145). He further states (*ibid.*, 74, footnote; Jäsche’s *Logik*, Einl. ix, and elsewhere) that the possible proposition is merely conceived but not judged, and is a work of the apprehension (*Verstand*); that the assertory proposition is judged, and is, so far, a work of the judgment; and that the necessary proposition is represented as determined by law, and is thus the work of the reason (*Vernunft*). He maintains that his deduction of the categories shows that, and how, the conceptions originally applicable to propositions can be extended to modes of being—constitutively, to being having reference to possible experience; regulatively, to being beyond the possibility of experience.

Hegel considers the syllogism to be the fundamental form of real being. He does not, however, undertake to work over, in the light of this idea, in any fundamental way, what is ordinarily called logic, but which, from his point of view, becomes merely subjective logic. He simply accepts Kant’s table of functions of judgment, which is one of the most ill-considered performances in the whole history of philosophy. Consequently, what Hegel says upon this subject must not be considered as necessarily representing the legitimate outcome of his general position. His followers have been incompetent to do more. Rosenkranz (*Wissenschaft d. logischen Idee*) makes modality to represent the super-

seding of the form of the judgment and to be the preparation for that of the syllogism. In the *Encyclopädie*, Hegel’s last statement, §§ 178–80, we are given to understand that the judgment of the Begriff has for its contents the totality (or, say, conformity to an ideal). In the first instance, the subject is singular, and the predicate is the reflection of the particular object upon the universal. That is, this or that object forced upon us by experience is judged to conform to something in the realm of ideas. But when this is doubted, since the subject does not, in itself, involve any such reference to the ideal world, we have the ‘possible’ judgment, or judgment of doubt. But when the subject is referred to its genus, we get the apodictic judgment. But Hegel had already developed the ideas of possibility and necessity in the objective logic as categories of *Wesen*. In the *Encyclopädie* the development is somewhat as follows: *Wirklichkeit* is that whose mode of being consists in self-manifestation. As identity in general (the identity of *Sein* and *Existenz*) it is, in the first instance, possibility. That is to say, apparently, bare possibility, any fancy projected and regarded in the aspect of a fact. It is possible, for example, that the present Sultan may become the next Pope. But in the second movement arise the conceptions of the *Zufällig*, *Aeusserlichkeit*, and ‘condition.’ The *Zufällig* is that which is recognized as merely possible: ‘*A* may be, but *A* may not be’; but it is also described by Hegel as that which has the *Grund*, or antecedent of its being, in something other than itself. The *Aeusserlichkeit* seems to be the having a being outside the ground of its being—an idea assimilated to caprice. That which such *Aeusserlichkeit* supposes outside of itself, as the antecedent of its being, is the presupposed condition. The third movement gives, in the first instance, ‘real possibility.’ In this we find the conceptions of ‘fact’ (*Sache*), ‘activity’ (*Thätigkeit*), and ‘necessity.’

Lotze and Trendelenburg represent the first struggles of German thought to rise from Hegelianism. The most remarkable characteristic of Lotze’s thought is, that he not only sees no urgency for unity of conception in philosophy, but holds that such unity would inevitably involve a falsity. He represents a judgment as a means of apprehending becoming, in opposition to the concept, which apprehends being; but he says that the business of the judgment is to supply the

cement for building up concepts. Accordingly, he has no doctrine of modality as a whole, but merely considers three cases, between which he traces no relation. Necessity may arise either out of the universal analytic judgment, the conditional judgment, or the disjunctive judgment. By the 'judgment' is meant the meaning of a proposition. Lotze finds that the meaning of the analytical judgment is illogical, since it identifies contraries. However, the meaning of this meaning is justified by its not meaning to mean that the terms are identical, but only that the objects denoted by those terms are identical. The analytic proposition is, therefore, admissible, because it is practically meant to mean a particular proposition, that is, one in which the predicate is asserted of all the particulars. And the justification of the proposition, whose use was to be to connect elements of terms, is that, meant not as it is meant, but as it is meant to be meant, these elements are identical and do not need to be connected. In this way Lotze vindicates the necessity of the analytical categorical proposition. Coming next to conditionals, by thought of the same order, he finds that, assuming that the universe of real, intelligible objects is 'coherent,' we may be justified in asserting that the introduction of a condition X into a subject S gives rise to a predicate P as an analytical necessity; and for this purpose, when it is once accomplished, it does not matter whether the ladder of the assumption of coherence remains or is taken away. Lotze treats the disjunctive proposition last, as if it were of a higher order, following Hegel in this respect. But what was excusable for Hegel is less so for Lotze, since he himself had signalized the significance of impersonal propositions, such as 'it rains,' 'it thunders,' 'it lightens,' whose only subject is the universe. Now, if there is any difference between 'If it lightens, it thunders,' and 'Either it does not lighten or it thunders,' it is that the latter considers the actual state of things alone, and the former a whole range of other possibilities. However, Lotze considers last the propositional form ' S is P_1 or P_2 or P_3 .' Properly, this is not a disjunctive proposition, but only a proposition with a disjunctive predicate. Lotze considers it a peculiar form, because it cannot be represented by an Euler's diagram, which is simply a blunder. The necessity to which it gives rise must, therefore, either be the same as the conditional necessity, or else differ from it merely by greater simplicity. For

other sound objections to Lotze's theory see Lange, *Logische Studien*, ii.

Trendelenburg (*Logische Untersuch.*, xiii) maintains that possibility and necessity can only be defined in terms of the antecedent (Grund), though he might, perhaps, object to the translation of Grund by so purely formal a word as 'antecedent,' notwithstanding its harmony with Aristotle. If all conditions are recognized, and the fact is understood from its entire Grund, so that thought quite permeates being—a sort of phrase which Trendelenburg always seeks—there is 'necessity.' If, on the other hand, only some conditions are recognized, but what is wanting in Grund is made up in thought, there is 'possibility.' In itself, an egg is nothing but an egg, but for thought it may become a bird. Trendelenburg will, therefore, neither admit, with Kant, that modality is originally a mere question of the attitude of the mind, nor with Hegel, whom he criticizes acutely, that it is originally objective.

Sigwart, who holds that logical questions must ultimately be decided by immediate feeling, and that the usages of the German language are the best evidence of what that feeling is, denies that the possible proposition is a proposition at all, because it asserts nothing. He forgets that if a proposition asserts nothing, the denial of it must be absurd, since it must exclude every possibility. Now, the denial of 'I do not know but that A may be true' is 'I know A is not true,' which is hardly absurd. Sigwart, it is true, in accordance with usages of speech, takes ' A may be true' in what the old logicians called the *sensus usualis*, that is, for the copulative proposition ' A may be true, and further A may be not true.' But this does not make it assert *less*, but *more*, than the technical form. In regard to the necessary proposition, Sigwart, following his guide, the usages of speech, finds that ' A must be true' asserts less than ' A is true,' so that from the latter the former follows, but not at all the latter from the former. This may be true for the usages of German speech, just as such phrases as 'beyond every shadow of doubt,' 'out of all question,' and the like, in our vernacular commonly betray the fact that there is somebody who not only doubts and questions, but flatly denies, the proposition to which they are attached. Bradley accepts the sensational discovery of Sigwart.

Lange (loc. cit.) thinks the matter is put in the clearest light by the logical diagrams

usually attributed to Euler, but really going back to Vives. 'We, therefore, here again see,' he says, 'how spatial intuition, just as in geometry, verifies (begründet) a priority and necessity.' (C.S.P.)

Mode [Lat. *modus*, manner]: Ger. *Modus*; Fr. *mode*; Ital. *modo*. In general, the manner of the existence of a thing. It is equivalent in the generic sense to the terms attribute, quality, state, all of which have substance as their correlative. But the term mode specially emphasizes the aspect of mutability or variability in things, that is, the change from one state to another. Although a substance, therefore, must exist in some mode, any individual mode is regarded as accidental. In consequence of this emphasis upon the aspect of variability, a differentiation arises between the term attribute, as signifying the permanent and essential qualities of a substance, and mode, as signifying its more variable qualities or the varying forms in which the fundamental attributes express themselves.

This is the sense of the term mode in the Cartesian system, where it first acquires philosophical prominence. 'We have understood by modes,' says Descartes (*Principia Philos.*, i. proposition 56), 'the same as what we elsewhere designate attributes or qualities. But when we consider substance as affected or varied by them, we use the term modes.' Besides God, to whom the term substance, in the sense of self-subsistent, is alone strictly applicable, there are for Descartes only two *summa genera* of things (or created substances), namely, minds or thinking things, and material or extended things. And of every substance, according to proposition 53, there is one principal property which constitutes its nature or essence, and upon which all the others depend. 'Thus extension constitutes the nature of corporeal substance, and is called *par excellence* its attribute, while the attribute of thought constitutes similarly the essence of thinking substance. For everything else that can be attributed to body presupposes extension, and is only some *mode* of an extended thing, as all the properties we discover in mind (such as imagination, sensation, or will) are only diverse modes of thinking.' Modes are thus modifications of the one fundamental attribute of substance. This is the distinction of substance, attribute, and mode which furnishes the framework of Spinoza's system, in which the substantiality of the *res extensae* and the *res cogitantes* disappears, individual minds becoming modes of the divine attribute

of thought, and individual bodies modes of the divine attribute of extension.

Locke gave the term currency in English philosophy by his division of complex ideas into 'modes, substances, and relations.' Modes are 'such complex ideas which, however compounded, contain not in them the supposition of subsisting by themselves, but are considered as dependences on, or affections of, substances.' Locke apologises for using the word in a technical sense. Modes are then divided into simple and mixed. Simple modes are 'only variations or different combinations of the same simple idea, as a dozen or score, which are nothing but the ideas of so many distinct units added together.' Mixed modes contain 'a combination of several ideas of several kinds, e.g. beauty, theft' (*Essay II*, 12. 3-5). (A.S.P.P.)

Literature: EISLER, Wörterb. d. philos. Begriffe, 'Modus'; HÖFFDING, Hist. of Mod. Philos. (and other Histories), Index. (J.M.B.)

Mode (in logic) [Lat. *modus*, trans. of Gk. τρόπος]. See MODALITY.

Model [Lat. *modulus*, dim. of *modus*, measure]: Ger. *Modell*, *Vorschrift*; Fr. *modèle*; Ital. *modello*. (1) In psychology: something held up for conscious IMITATION (q. v.).

It is recommended that this term be in all cases employed for the matter set up for purposes of imitation (the usage of Taine, Tarde, Royce), the term COPY (q. v.) being used in the wider sense given it under that topic. The word 'example' is used in the four languages, especially with an ethical reference, for cases in which the model is explicitly chosen and pursued.

(2) In biology: see MIMICRY (4).

Literature: see IMITATION, and MIMICRY.

(J.M.B., G.F.S.)

Moderation. Sometimes used to render the Greek σωφροσύνη. See TEMPERANCE. (J.M.B.)

Modesty [Lat. *modestus*, moderate]: Ger. (1) *Bescheidenheit*; Fr. (1) *modestie*; Ital. (1) *modestia*. (1) The form of timidity or shyness due to reflective self-consciousness.

(2) A popular term for general lowliness of mind.

The demarcation of modesty off from the other forms of SHYNESS (q. v.) is difficult, especially in view of the confusions of popular usage. There is often an element, both in the conscious state and in the physical reaction of modesty, due to the particular exciting object, which may, at the same time, excite SHAME or COYNESS (see those terms); as, for example, when modesty is excited by physical indelicacy, which also produces shame.

Indeed, it is seldom that reflective emotion such as this is not complicated with special feelings and attitudes toward the object.

Literature: see SHYNESS. (J.M.B., G.F.S.)

Modification (in biology) [Lat. *modificatio*]: Ger. (*individuell erworbene*) *Abänderung* (Wundt); Fr. *modification*; Ital. *modificazione*. A structural change wrought during the individual's lifetime (or acquired), in contradistinction from variation, which is of germinal origin (or congenital).

The term was used sometimes, but not consistently, in this sense by Darwin. In the Darwinian phrase 'descent with modifications' the ambiguity is evident as between what is congenital and what acquired.

The distinction indicated in the definition has been rendered necessary by the discussion as to the inheritance of acquired characters. Modifications are acquired by the individual; whether they can be transferred to the germinal substance and thus become hereditary as variations is the problem under discussion. See ACQUIRED CHARACTERS, and HEREDITY. Organisms capable of extensive modification are termed plastic; and this PLASTICITY (q.v.) may be subject to selection. The term ACCOMMODATION (q.v.) is reserved by some writers for the moulding of behaviour to environmental circumstances on the part of organisms, referring to function rather than to structure. On the hypothesis of ORGANIC SELECTION (q.v.) modifications of structure may serve to foster COINCIDENT VARIATIONS (q.v.) of like nature, and accommodations of behaviour may thus set the direction of congenital variation, and so of evolution under the action of natural selection.

Literature: LLOYD MORGAN, *Habit and Instinct*; J. MARK BALDWIN, *A New Factor in Evolution*, Amer. Natural., June-July, 1896; HEADLEY, *The Problems of Evolution* (1901). (C.L.L.M.—J.M.B.)

Modification and Variation (mental). The same distinction between these terms is recommended as that given under MODIFICATION (in biology). Cf. VARIATION. (J.M.B.)

Modulus [Lat. *modus*, a mode]. (1) Proposed by Schröder (Ger. *Modul*; Fr. not in use; Ital. *modulo*, suggested—E.M.) for the four relative terms upon which the logic of dual RELATIVES (q.v.) hinges; namely, 'Not,' 'Same as,' 'Excluded from a universe containing,' and 'With, or within a universe containing.'

These terms were first called by Peirce the 'definite dual relatives of second intention';

he now thinks it might be well to term these the four 'cardinals,' or four cardinal dual relatives.

Literature: PEIRCE, in *Studies in Logic by Members of the Johns Hopkins University*, 191, and Amer. J. Math., iii. 47; SCHRÖDER, *Algebra d. Logik*, iii. 117.

(2) See ERRORS OF OBSERVATION. (C.S.P.)

Modus ponens and **Modus tollens** [Lat.]. Two ways of reasoning from a conditional proposition or consequence. The *modus ponens* from the consequence and the antecedent infers the consequent; the *modus tollens* from the consequence and the falsity of the consequent infers the falsity of the antecedent, thus:

Modus Ponens. *Modus Tollens.*

If *A* is true, *C* is true; If *A* is true, *C* is true;
A is true; *C* is false;
∴ *C* is true. ∴ *A* is false.

A third way of reasoning, namely, from the truth of the antecedent and falsity of the consequent to the falsity of the consequence, is generally overlooked. See HYPOTHETICAL (syllogism). (C.S.P.)

Mohammed, or **Mahomet**, or **Mahomed**, or **Muhammed**. (cir. 570–632 A.D.) An Arabian prophet, born at Mecca. His father died about the time of Mohammed's birth, and his mother in his sixth year. He was raised by a grandfather and an uncle. The latter, Abu Talib, was his faithful friend and protector all through life. Accounts of Mohammed's youth are legendary: he probably tended flocks until his twenty-fifth year, when he entered the service of a rich widow named Chadidja, whom he married. In his fortieth year Mohammed saw his first 'vision' and received his 'message.' In four years he made forty proselytes, and it was revealed to him that he must preach openly. As his followers increased in numbers, he was forced to the most careful watchfulness to save his life. About 622 he moved to the friendly city of Medina, and the Mohammedan era dates from the first month of the following Arabic year. Mohammed now became the law-giver, judge, and ruler of Medina and of two powerful Arabian tribes. In the first year of the new era, he assumed hostilities against his enemies. War followed, and in the sixth year of the new era the first pilgrimage to Mecca was announced, but not carried out until the following year. The Meccans concluded peace with him, however, and he had become an equal power. His missionaries passed throughout Arabia, and even beyond its borders. Mohammed's forces being de-

feated in a battle with the Christians, the Meccans broke the peace-treaty. Mohammed defeated them, however, and his religion became supreme in Arabia. He was likewise successful against a combination of hostile tribes in the eighth year of the new era. Two years later, at the head of forty thousand Moslems, he made his last solemn pilgrimage to Mecca. See MOHAMMEDANISM.

Mohammedanism [Arab. *al-Islām*, the religion of 'self-surrender' or 'resignation' to God's will]: Ger. *Mahomedanismus* (*Islam*); Fr. *Mahométisme* (*Islam*); Ital. *Maomettismo* (*Islamismo*). It should be observed, however, that the Prophet, according to his own view and that of his followers, restored rather than created the religion of Islām, the faith of Abraham; and that hence the term *Muslim*—less correctly but more commonly written *Moslem*—is constantly applied by them to persons who lived before the time of Muḥammad or Mohammed (less correctly Mahomed, Mahomet). The religion founded by MOHAMMED (q. v.) may be defined as the latest of the great Semitic religions, teaching as its cardinal doctrines the Unity and Personality of God, the prophetic mission of Mohammed—the last of the prophets and the seal of the prophets—the plenary inspiration of the Qur'ān (Koran, Coran), the resurrection of the body, and a system of rewards and punishments in a future life.

The simplicity of the Mohammedan confession of faith—'I bear witness that there is no god but God, and I bear witness that Mohammed is his servant and his apostle'—is at once its strength and its weakness; its strength, because the deliberate utterance of this formula is sufficient to secure to him who utters it the rights, privileges, and status of a Muslim; its weakness, because it may be, and has been, interpreted in the most diverse senses. Hence we find the wide diffusion of Islām amongst many races, including alike the most subtle and spiritual and the most stupid and material, corresponding with an immense variety of sects amongst its adherents; a fact fully recognized by the Muslims themselves in the oft-cited tradition: 'The Magians are divided into seventy sects, the Jews into seventy-one, the Christians into seventy-two, and the Muslims into seventy-three, of all which sects but one shall be saved'; and the tradition: 'My Church shall become divided into seventy-three sects, whereof but one shall be saved, while the rest shall perish.' Nor are the differences which separate some

of these sects of a trivial character; the thorough-going pantheism of some of the Sūfis (see SŪFISM) stands at the opposite pole to the rigid monotheism of the orthodox followers of al-Ash'arī; the strong belief in free-will held by the Mu'tazilites (the dominant party under the early 'Abbāsid caliphs) offers the sharpest contrast to the extreme predestinarianism (commonly regarded as an essential feature of Islām) which prevailed later; while amongst certain sects of the extreme Shī'ites (see SUNNITES AND SHī'ITES) the most grotesque forms of anthropomorphism and metempsychosis are to be found, notably amongst the Isma'īlīs, Nuṣayrīs, Druzes, Ḥurūfīs, and certain of the Bābīs.

If, however, we except Persia (which is, from the point of view of a Turk, Egyptian, Afghan, or Moor, almost entirely unorthodox), the ordinary orthodox Sunnī doctrine teaches, in addition to the essentials already enunciated: (1) the plenary inspiration of the Qur'ān, which is throughout regarded as the direct utterance of God, conveyed from time to time to the Prophet as occasion arose; (2) the resurrection of the dead, and the judgment and recompense of all mankind; (3) predestination of both good and evil; (4) the consummation and conclusion of the prophetic function in Mohammed; and the following obligations: (a) declaration of the divine unity; (b) prayer, preceded by ablution, at five specified periods of the day; (c) almsgiving; (d) fasting in the month of Ramaḍān; (e) pilgrimage to Mecca once at least in a lifetime, for all whose health and wealth enable them to undertake it. Abstinence from certain foods (notably pork, and all intoxicating drinks) is also obligatory; while circumcision, though not theoretically indispensable, is in practice universally observed.

The doctrines of Islām are based on, and deduced from, (1) the *Qur'ān*, the Word of God; (2) the *Hadīth*, 'Traditions,' or sayings of the Prophet; and (3) the *Sunnat*, or practice of the Prophet, his 'companions,' and their immediate 'followers.' The Qur'ān alone is not only insufficient for that minute regulation of every detail of daily life which Oriental peoples are prone to expect from their religion, but is, in fact, often inconsistent with itself, reflecting, in its various portions, the changing moods of the Prophet, and the very diverse circumstances of failure, success, hope, despair, and ultimate triumph in which at different epochs of his prophetic career (A.D. 610–32) he found himself. In

general, the earlier or Meccan *súras* (chapters) are shorter, more vigorous, less doctrinal, and in some respects (notably in their attitude towards the Jews and Christians) more tolerant than those revealed at Medina after the *hijra* (Hegira) or 'Flight' (A.D. 622); and since the 114 *súras* which constitute the Qur'án are arranged, on the whole, according to their length, the shortest coming last, it has been truly observed that he who would study the evolution of the Prophet's doctrine would do better to read them in inverse order than as they are now placed. These inconsistencies, however, did not greatly trouble the Arabs (an essentially practical people, little given to metaphysical speculations), to whom primarily Mohammed addressed himself; nor, in any case, were the stirring times in which he and his immediate disciples lived favourable to the elaboration of a complete theological system. This was reserved for their successors, more especially the non-Arabian peoples on whom the valour, ambition, and proselytizing zeal of the conquering Arab Muslims soon imposed the religion of Islám. Amongst these the Persians were conspicuous, and, as has often been observed, it was to them especially that the elaboration of what is often misnamed Arabian science and Arabian philosophy (see the topics to which reference is made under ARABIAN PHILOSOPHY) was due. Arabic, it must be remembered, was, for the first four or five centuries of Islám, the language not only of religion, but also of philosophy, science, poetry, and diplomacy throughout the Mohammedan world, and even at the present day in Persia it is still the vehicle in which serious treatises on religious or philosophical subjects are written; while the semi-Persian character of the 'Abbásid rule, which had its centre at Baghdad, and reached its zenith in 'the golden prime of good Haroun Alraschid,' is now generally recognized.

It was, then, by these more civilized and speculative peoples that the elaboration and synthesis of Mohammedan doctrine was effected. The inconsistencies of the Qur'án were removed by the science of 'the abrogating and the abrogated' (*násikh wa mansúkh*); and its deficiencies were supplemented by the collection and critical examination of a vast number of traditions as to how the Prophet and his companions behaved, and what they said and did, in various circumstances and emergencies. The older traditionists (of whom al-Bukhári and Muslim are the most celebrated) spared

no pains in the collection and selection of these traditions, gathered orally in many long and laborious journeys through Arabia; and though the severe critical method which they adopted proved fatal to the pretensions of the greater number, enough remained to form a basis for a pretty complete system of theology and jurisprudence. At a later date, when the critical faculty waxed weaker and a less honest and more partisan feeling prevailed, spurious traditions (often fabricated with some obvious political or polemical purpose) were freely coined: 'I have observed,' says a traditionist who died in A.D. 827, 'that the pious man is in nothing more ready to lie than in what concerns the *Hadíth*,' and the Shí'ite theologians are generally regarded as particularly open to criticism in this respect.

The earlier sects of Islám (Khárijites, Murjiyya, &c.), including most of the early Shí'ites, or partisans of 'Alí and his family, were mainly political, but the Mu'tazilites ('Separatists'), or 'partisans of the divine justice and divine unity,' as they called themselves, who were the dominant party under the early 'Abbásids (especially in the 9th century of our era), strongly opposed the separation of the Attributes from the Essence of God, the doctrine of predestination, the theory that the Qur'án was increate and existed from all eternity, and the beliefs that God could be seen with the eyes, and that wicked Muslims should not suffer eternal punishment, in all of which points they were in antagonism to the 'orthodox' party, which, for all their liberal tendencies, they vehemently persecuted. Favoured by the court of Baghdad, and armed with the logical weapons which they had borrowed from the Greek philosophers, they enjoyed for a long time undisputed superiority, both intellectual and political, over their opponents; and, had they been able to maintain their supremacy, the whole future history and development of Islám might have been very different, but unfortunately their political ascendancy was checked by a change of view on the part of the caliphs, while the desertion from their ranks of the celebrated Hasan al-Ash'arí furnished their adversaries with the controversial weapons of which they had hitherto enjoyed a monopoly. Except for a few highly educated and intelligent natives of India, notably Syed Ameer Ali, author of *The Spirit of Islam*, the once powerful Mu'tazilites hardly exist at the present day; while even these 'neo-Mu'tazilites' are rather to be regarded as modern 'broad-church' Muslims

than as the lineal successors of the ancient sect.

The Sunnis, who greatly outnumber the Shi'ites, comprise the four orthodox schools or sects of Abú Hanífa (Hanífites), Ibn Hanbal (Hanbalites), ash-Sháfi'í (Sháfi'ites), and Ibn Málík (Málíkites), which differ from each other only in comparatively unimportant points of doctrine and practice. Of the Shi'ites, the 'Sect of the Seven' (*Sab'iyya*), or Isma'ílís, has still a few adherents in Syria, and is represented at Zanzibar, and by the Khojas and other cognate sects in India, notably at Bombay (where Aghá Khán, the spiritual head of the Khojas, resides) and in Chitrál. The great bulk of Shi'ites at the present day belong, however, to the 'Sect of the Twelve' (*Ithná 'ashariyya*), which is now the national religion of Persia. In Syria they commonly go by the name of *Metáwila*. At the opposite pole to them stand the *Wahhábís*, those Puritans and reactionaries of Islám who created so great a turmoil in Arabia and the adjoining regions at the end of the last century, and whose denunciations and attacks were especially directed against the adoration of saints, the superstitious veneration of holy places, and tobacco-smoking.

The finest conception of Islám promulgated by the Prophet himself occurs in the second *súra* of the Qur'án, v. 172, and runs as follows:—

'Righteousness is not that ye turn your faces to the East and the West; but righteousness is this. Whosoever believeth in God, and the Last Day, and the Angels, and the Book, and the Prophets; and whoso, for the love of God, giveth of his wealth unto his kindred, and unto orphans, and the poor, and the traveller, and to those who claim an alms, and for the release of the captives; and whoso observeth prayer and giveth in charity; and those who, when they have covenanted, fulfil their covenant; and who are patient in adversity and hardship, and in times of violence:—these are the righteous and they that fear the Lord.'

To appreciate Mohammed's work at its true value, we must remember what he found his people and what he left them. The contrast between the early Muslims and the heathen Arabs is nowhere better brought out than in the reply made by the fugitives at the Abyssinian court to the Nejáshí or sovereign of that country and his bishops and nobles. 'O king!' they said, 'we were a barbarous folk, worshipping idols, eating carrion, leading

sinful lives, violating the ties of kinship, evilly entreating our neighbours, the strong among us oppressing the weak; and thus we were until God sent unto us an apostle from among ourselves, whose pedigree we knew, as also his veracity, integrity, and chastity, who summoned us unto God, that we should declare His unity and worship Him, putting away the stones and idols which we and our fathers used to worship in His stead; and who bade us speak truly, faithfully discharge our trusts, observe the ties of kinship, act rightly towards our neighbours, and refrain from forbidden things and from blood; and who forbade us from sinful practices, vain words, consuming the property of orphans, and mis-using virtuous women; and who commanded us to worship God, associating none with Him, and to pray, and give alms, and fast.'

Molecule and **Molecular Force**: see MATTER.

Molinos: see QUIETISM.

Moment: see PRESENT, and TIME PERCEPTION.

Moment [Ger.]: an element or FACTOR (q. v.). It is coming into use in English. (J.M.B.)

Moment (of force) [Lat. *momentum*, movement]: Ger. *Kraftmoment*; Fr. *moment*; Ital. *momento (della forza)*. The product of the intensity of a force acting along a line DF by the perpendicular DP from that line to some given point P . The amount of the moment therefore depends on the position of P , which

may be any position required by the special problem in hand. Cf. MOMENTUM. (S.N.)

Momentum [Lat.]: Ger. *Moment*, *Bewegungsmenge*; Fr. *quantité de mouvement*; Ital. *momento*. The product of the mass of a moving body into its velocity.

Moment of momentum. In the case of a particle moving along a line DF (see MOMENT of force) by the perpendicular distance DP from the line to a given point. It differs from the MOMENT (q. v.) of force only in that the momentum of the particle is used instead of the force acting upon it.

In the case of a body or any other system of particles, the sum of the moments of momentum of the different particles. The following is a fundamental property: the moment of momentum is a minimum when for P we take the centre of gravity of the system, and remains constant so long as the system is not acted upon by any force but the mutual action of its own parts. (S.N.)

Monad (**Monadism**, **Monadology**) [Gr. *monás*, unit]: Ger. *Monade*; Fr. *monade*; Ital. *monade*. In ancient philosophy, the unit in arithmetic, or unity as opposed to duality; it figures in this sense in the numerical speculations of the Platonic school and the later Pythagoreans. The special case of the number two, considered as unit or constituent of being, was known to the Pythagoreans as the

Dyad (for Zenocrates' doctrine of the Dyad see ONE). (A.S.P.P.—J.M.B.)

(1) With the Pythagoreans, the monad was the number one considered, as well as we can make out, as the first creative deity (Zeller).

(2) In other Greek schools a monad is simply an individual. With the Atomists, an atom.

(3) In the philosophy of Leibnitz a monad is a being pursuing its development according to an inward law, in pre-established harmony with other beings. The idea may be illustrated by two pendulums, each moving according to a formula of its own. This illustration is used by Leibnitz himself. This theory has been resuscitated by Renouvier (*La Nouvelle Monadologie*, Paris, 1898).

(4) In the logic of RELATIVES (q. v.), a proposition with one term left blank, to be filled in if the proposition is to be completed. In chemistry: a radicle with one free bond. (C.S.P.)

In its modern signification the term appears to have been first made current by Giordano Bruno, who uses it, in conscious opposition to the atoms of Democritus, to denote the individual imperishable elementary substances in which the divine essence of the universe manifests itself. Each monad combines form and matter; it is at once spiritual and corporeal. The universe is thus living throughout its minutest parts, and each monad is a microcosm or mirror of the whole. God is called the *Monas monadum*. Bruno's conception of the monads thus combines an intense individualism with a thorough-going pantheism. The analogy of Bruno's conception with the later doctrine of Leibnitz is obvious, and it has been supposed that Leibnitz was indebted to the earlier thinker both for the doctrine and the term. Ludwig Stein, however, who traces very carefully the development of the doctrine of monads in Leibnitz's writings, adduces good grounds for the conclusion that Leibnitz worked out his doctrine of individual substances independently of Bruno, and that the term itself, which he first used in 1696, was suggested to him not by Bruno, but by a contemporary of his own (Van Helmont the younger), with whom he was in correspondence, and who visited him in that year. Had Leibnitz taken his view from Bruno, he would have taken the term at the same time; but the term is used for the first time in 1696, some years after the doctrine had taken definite shape in his mind, and is constantly used thenceforward as the technical term by which he desires to indicate the peculiarity of his own position.

Leibnitz's *Monadology* is the result of his revision of the Cartesian doctrine of substance. Substance, he maintains, is to be conceived as activity or active force; and whereas, according to the abstract definition of substance as the self-existent, it follows that there can be only one substance, room is left, according to the new definition, for an infinite variety of individual substances. These are the monads, not material or extended like the atoms of the physicists and the mechanical philosophers, but 'metaphysical points' or immaterial centres of force, their inward force or life being conceived, after the analogy of mental life, as a grade of 'perception' or ideation, though the grade of mentality may be so low as not to be properly spoken of as conscious. Each monad is entirely self-contained, developing all its experience from within, but each mirrors or 'represents' the universe from its own particular point of view. The system or hierarchy of monads, rising continuously from the lowest to the highest grade of perfection, constitutes the pre-established harmony in which the universe consists. God is represented as the creator of the monads, in so far as he conferred real existence on what pre-existed ideally in the divine thought. At other times, however, God would appear to be, in metaphysical consistency, only an expression for the harmony of self-subsistent monads.

Monadism, in accordance with the foregoing, might be defined as spiritual atomism or spiritual individualism. If the individual substances are supposed to be metaphysically self-subsistent in their isolation, monadism would be a doctrine of ultimate pluralism, at variance with the monistic impulse in which speculation has its rise and by which it is maintained. But a thinker like Lotze, who has his roots in the *Monadology*, conceives the monads or spiritual substances not as absolute or unrelated reals, but as organic members of one world, moments in the life of one Being, which conditions them all and makes reciprocal interaction possible.

The doctrine of MIND-STUFF (q.v.) or the theory that every atom or material fact has its inner side—its atom of sense or consciousness—presents a monadic character; but, in the form originally given to it by Clifford, it dissolves the unity of consciousness into bits or ultimate units of mind-stuff which compound themselves into what we call a mind. It is simply atomism done into terms of mind. (A.S.P.P.)

Literature: EISLER, Wörterb. d. philos.

Begriffe, sub verbo; LEIBNITZ, *Monadology* (Eng. trans., in J. of Specul. Philos., i. (1867) 129, or in ed. by Latta); DUNCAN, *Philos. Works of Leibnitz* (trans.); LOTZE, *Microcosmus*, and *Hist. of Philos.*; L. STEIN, *Leibnitz and Spinoza*. (J.M.B.)

Monasticism: see ASCETICISM.

Monergism [Gr. *μόνος*, alone, + *ἐργον*, work]: Ger. *Monergismus*; Fr. *monergisme*; Ital. *monergismo*. The doctrine of those Augustinians who deny the co-operation of the human will in the work of regeneration, and hold that it is wholly the work of the Holy Spirit, the human will being passive. See SYNERGISM. (A.T.O.)

Moneron [Lat. *monus*, alone, single]. A name given by Haeckel to the simplest known organisms, including naked Protozoa, such as Amoeba, Protomyxa, and Vampyrella. See E. Haeckel, *Gen. Morphol.* (1866); *Hist. of Creation*. Cf. AMOEBA, and PROTOZOA. (E.S.G.)

Money [OF. *monnaie*, Lat. *moneta*]: Ger. *Geld*; Fr. *monnaie*, *argent*; Ital. *moneta*. A thing which, by common consent of the business community, is used as a basis of commercial obligations.

There are two quite distinct purposes for which supplies of money are needed by the business community and its individual members: (1) as a reserve to secure solvency; (2) as a medium of exchange.

The latter function seems at first sight much more important than the former; so much so, that most writers have made it the basis of the definition of money. It was so in large measure with Smith and Mill; it is much more explicitly so with some modern writers. 'Money is the medium of exchange,' says Walker. 'Whatever performs this function is money.' To this view there are two objections. First, the actual medium of exchange for important transactions is the bank cheque; and Walker himself shrinks from calling this money, though it is a legitimate consequence of his own definition to do so. Second, the thing which a man must have in order to do business is not a convenient medium, but an acceptable reserve. If he has this, he can transfer title in any way he pleases. To lay stress on the means of transfer instead of that which is behind it, opens the way for fallacies both theoretical and practical.

Literature: JEVONS, *Money and the Mechanism of Exchange*; treatises on political economy and finance. (A.T.H.)

Monism [Gr. *μόνος*, alone]: Ger. *Monismus*; Fr. *monisme*; Ital. *monismo*. Monism is, in

strictness, a name applicable to any system of thought which sees in the universe the manifestation or working of a single principle. Cf. DUALISM, and PLURALISM.

Such a unity may be said to be at once the tacit presupposition and the goal of all philosophic effort, and in so far as a philosophy fails to harmonize the apparently independent and even conflicting facts of experience, as aspects or elements within a larger whole, it must be held to fall short of the necessary ideal of thought. Dualism, in an ultimate metaphysical reference, is a confession of the failure of philosophy to achieve its proper task; and this is the justification of those who consistently use the word as a term of reproach. But the contradictions of experience are so profound, and the difficulties of an ultimate synthesis accordingly so great, that monistic systems are apt to reach their unity by neglecting or overriding fundamental distinctions. Dualism in these circumstances is frequently the reassertion of these distinctions against a monism which the critic considers too 'cheap and easy'; and in the mouth of such critics monism in turn tends to be used in a dyslogistic sense, and to be applied specifically to systems which, by merging the variety of existence in a pantheistic unity, leave no room for individuality or freedom. The doctrine of the Eleatics in ancient, and that of Spinoza in modern, philosophy might be taken as types of such systems. Schopenhauer's pantheism of the will would be a more modern example. Lotze's reference to the 'bold monism' of Hegelian idealism hovers between the two usages of the word, for he expressly recognizes a monistic explanation as the goal of philosophy, while, at the same time, he contends that Hegel's synthesis is overhasty, and does not do justice to all the elements of the problem. Ladd points out (*Introd. to Philos.*, 403) that there are 'two fundamental and irremovable distinctions, the distinction between matter and mind and the distinction between moral good and evil,' the denial or insufficient explanation of which, by speculative systems, provokes, and relatively justifies, the recurrent protest of dualism. But 'we give credence to dualism only in order to be more cautious and penetrating in our philosophical analysis, more patient and comprehensive in our attempt at a final philosophical synthesis. In being consistently and persistently philosophical we are always seeking some form of monistic system.'

The term 'monist' seems to occur first in

Wolff, who uses it, in connection with the relation of mind and body, to designate those thinkers who acknowledge only one principle, whether mind or body. It thus includes both idealists and materialists, and is opposed to dualist, dualism being Wolff's own position. After Wolff the term was not much used till it was revived by the Hegelian school in the first half of the present century. Göschel published a book in 1832 called *Der Monismus des reinen Gedankens*. Sir William Hamilton uses it much in the Wolffian sense, in connection with the question of external perception, to include (1) idealists, (2) materialists, and (3) those who maintain that 'mind and matter are only phenomenal manifestations of the same common substance' (*Lects. on Met.*, i. 296). The term thus includes with him all philosophers except those whom he designates natural dualists (e.g. Reid) and hypothetical dualists (e.g. Descartes and Locke and the 'great majority of modern philosophers'). Hamilton's classification, however, is made with too exclusive reference to a single epistemological problem, instead of being undertaken from an ultimate metaphysical point of view.

In recent discussion the term has come into popular use in connection with the psychophysical question of the relation of MIND AND BODY (q. v.). It is used by a number of writers to denote what is otherwise known as the double-aspect theory or the theory of parallelism. According to this view, 'we have no right to take mind and body as two beings or substances in reciprocal interaction. We are, on the contrary, impelled to conceive the material interaction between the elements comprising the brain and the nervous system as an outer form of the inner ideal unity of consciousness. It is as though the same thing were said in two languages' (Höffding, *Outline of Psychol.*, chap. ii). As this doctrine obviously reproduces the Spinozistic theory of parallelism between the attributes of thought and extension, it is sometimes spoken of as Neo-Spinozism. It sometimes claims merely to state an empirical concomitance, and to rank therefore as a scientific law, without involving a decision on the metaphysical question of the ultimate ground of existence. But in general the theory is not limited to the case of 'minds,' or even of living things, but is made coextensive with existence, each particle of matter being supposed to possess a mental aspect. It passes, therefore, into a metaphysical theory which represents the world of consciousness

and the world of matter as parallel manifestations of one underlying substance. Philosophically, such a theory must be regarded as imperfect, in so far as it offers no explanation of the duality which it empirically accepts, and throws no light on the nature of the identical substance which it speculatively asserts. In any case, this application of the term monism is an unwarrantable limitation of the term to a single form or variety of monism regarded as a philosophical theory. It is sometimes known as 'scientific monism.'

Literature: works on metaphysics generally, and BIBLIOG. B, 2, f. In relation to the last-mentioned use of the term cf. HÖFFDING, as cited above; LLOYD MORGAN, *Compar. Psychol.*, Prolegomena and chap. ii; ROMANES, *Mind, Matter, and Monism*; CARUS, numerous papers in the *Monist*, i. ff.; E. HAECKEL, *Natürliche Schöpfungsgesch.*; *Monismus als Band zwischen Wiss. u. Religion* (1895, Eng. trans.); and *Riddle of the Universe* (Eng. trans., 1900); E. MORSELLI, *La Filos. monistica in Italia*, Riv. di Filos. scient. (1886); and GIORDANO BRUNO, *Commém.* Address, Rome, 1887 (1888). (A.S.P.P.)

Monitorial System [Lat. *monitor*, from *monere*, to advise]: see BELL AND LANCASTER.

Mono- [Gr. *μόνος*, single, only]: Ger. *Mono-*; Fr. *mono-*; Ital. *mono-*. (1) In one respect: as MONOMANIA (q.v.); also termed, by Clouston, *monopsychosis*. (2) Affecting one part or member of the body: as *monoplegia*, paralysis of one limb; *monocular*, relating to one eye; *monologue*, repetition of one sound (Lall-Monologue, Preyer: see LALLING). (J.J.)

Monogony: see AGAMOGENESIS.

Monoideism [Gr. *μόνος*, alone, single, + *ιδέα*, idea]: Ger. *Monoideismus*; Fr. *mono-idéisme*; Ital. *monoideismo*. A state of mind in which the attention is fixed for a somewhat extended period upon a single idea, with a certain artificial concentration known variously as 'paralysis,' 'rigidity,' 'spasm,' 'static contraction,' &c., of the attention. It occurs in cases of pathological FIXED IDEAS (q.v.), HYPNOSIS (q.v.), and what is variously called 'charming,' effect of 'evil eye,' &c.

This is in opposition to the usage (Ribot) which applies monoideism to normal attention, in which the ready and facile movement of attention over a field, and transition from one object to another, is in sharp contrast to the fixity noted here. (J.M.B.—G.F.S.)

Monologue: see MONO-, and LALLING.

Monomania [Gr. *μόνος*, single, + *μανία*, madness; according to Esquirol, derived from

μήνη, moon, maniac being the Greek form for the Latin form 'lunatic']; Ger. *Monomanie*; Fr. *monomanie*; Ital. *monomania*. Introduced by Esquirol for partial insanity and melancholia (in its original sense), in distinction from the more diffuse disorders—mania, dementia, and imbecility. Prichard introduced it in English (cf. MORAL INSANITY).

The existence of such limited disorders cannot be questioned; but they appear under so many distinct conditions that it is more customary and better to sacrifice the merely descriptive term monomania for one which suggests the actual clinical process involved. Indeed, the term is at present mainly of historical interest, and reflects an uncritical attitude which classifies symptoms on superficial resemblance instead of on ground of their origin, development, and correlation (cf. PSYCHOSES). Even for those psychoses in which the symptom-complex remains throughout that of partial delusional insanity, most writers have abandoned the term monomania in favour of PARANOIA (q.v.). The word mania is no longer used for delusional states or delusions in psychiatry; and even if it were, there are too many cases of this type in which more than one 'mania' exists (e.g. delusions of grandeur and delusions of persecution). Moreover, it seems dogmatic to merely call the delusions themselves abnormal, and not to acknowledge the weakness of the 'normal part' of the reasoning, which fails to counteract the formation of the delusions. Prichard himself admits that on careful inquiry it will often be found that the mind is in many respects in a different condition from that of perfect health.

The forms which Esquirol classified under this term are now divided as follows:—

(1) PARANOIA (q.v.) and paranoic conditions. (2) Residuals from processes of deterioration: chronic delusional conditions representing the result of katatonia and dementia praecox. See PARANOIA (secondary). Esquirol's cases of 'erotomania' are paranoic forms of dementia praecox. (3) Epidemic hysteria of religious character. (4) Manic-depressive insanity (several of Esquirol's instances of monomanie raisonnée are cases of recurrent hypomania). (5) Constitutional neurasthenia or psychopathic inferiority (phobias, tics, impulses, &c.). Prichard also includes melancholia, hypochondriasis, and paranoia with somatic delusions, &c. Cf. the topics cited.

Literature: ESQUIROL, *Des Maladies mentales*, ii. 1 ff. (1839); PRICHARD, *Treat. on*

Insan., 26 ff. (1835); SPITZKA, *Insanity* (1883); BALLET-MORSELLI, *Psicosi* (1896). (A.M.)

Monophysites [Gr. *μόνος*, single, + *φύσις*, nature]: Ger. *Monophysiten*; Fr. *monophysites*; Ital. *monofisiti*. A sect of Eastern Christians taking its rise in the 5th century, who, while admitting the union of the two natures in the incarnation of Jesus, yet maintain that his nature is essentially simple, the human element being virtually absorbed into the divine.

This doctrine gave rise to an important controversy, which involved both the political and ecclesiastical relations between Rome and Constantinople. The doctrine was finally declared heretical, and Severus, its principal exponent, condemned. The doctrine survived, however, being especially strong in Egypt. The Armenian Church of the present is nominally of the Monophysite belief.

Literature: DORNER, *Christliche Glaubenslehre*, ii (1880, also Eng. trans.). (A.T.O.)

Monopoly [Gr. *μόνος*, exclusive, + *πωλεῖν*, to barter]: Ger. *Monopol*; Fr. *monopole*; Ital. *monopolio*. (1) An exclusive trade privilege. (2) The control, in whatever way obtained, of all the sources of supply of any commodity in a particular market. (3) The control of a specially good source of supply.

The advantage under (3) is more properly called a differential gain than a monopoly.

The most common instances of (1) are patents and copyrights. They are granted not so much because of any theory of property in ideas, as on account of the fact that few people can develop a new process or issue a new book unless assured of some valuable gain in case of success to counterbalance the large loss in case of failure.

Monopolies of form (2) arise chiefly in this way: when the most economical supply of the market requires a mass of concentrated capital, there may not be an aggregate demand sufficient to support more than one such concern at any price; and even where things have not reached this extreme, there will often be so few concerns as to render continuation easy and the advent of a new competitor slow and difficult. Railroads and waterworks often furnish an example of the former class; manufacturing TRUSTS (q.v.) of the latter. (A.T.H.)

Monosyllogism: see SYLLOGISM.

Monotheism [Gr. *μόνος*, alone, + *θεός*, God]: Ger. *Monotheismus*; Fr. *monothéisme*; Ital. *monoteismo*. (1) In religion: the belief in one God.

This term is more in use in the history of religion than in philosophy, and is used chiefly in contrast to polytheism. Hence Xenophanes is frequently spoken of as a monotheist on account of his polemic against the polytheism of the popular faith of Greece: 'One God there is, greatest among gods and men, neither in form nor in thought like unto men.' So also Judaism is characterized as a monotheistic religion in contrast with the polytheistic nature-worship of the surrounding peoples, and the same epithet has been applied in later times to Mohammedanism. Monotheism, as a reaction from nature-worship, involves the conception of God as a spiritual being distinct from nature, which is regarded as his creation. This distinction of the Creator from his creation tends, in the typical monotheistic religions mentioned, to pass into an abstract separation, which reduces God to an externally active Cause and Lawgiver. Hence monotheism is treated by some writers as a defective doctrine—a stage on the way to a philosophical theism (see 2, below). Thus, for example, Edward Caird, in his *Evolution of Religion* (ii. 67), says, speaking of the relation of Judaism to Christianity: 'Nothing could meet the want of the time but a religion which should unite the immanence of pantheism with the transcendence of monotheism.' Historically, there are two conflicting theories of the order of religious development; the one regarding polytheism as the corruption of a purer form of monotheistic belief; the other representing monotheism as an evolution from pre-existing polytheism. (A.S.P.P.—A.T.O.)

(2) In philosophy: the doctrine that God is one indivisible being and the embodiment of the unitary principle of reality.

Monotheism, in philosophy, is a genus of which THEISM and PANTHEISM are species (see those terms). It is to be distinguished from henotheism, the doctrine of a supreme being in a hierarchy of deities. Monotheism may stop short of the assertion of the personality of God, as in pantheism. Its one distinctive feature is its dogma of the unity of the divine nature.

Literature: see the topics named, especially THEISM, and BIBLOG. E, 2, e. Also ZELLER, *Development of Monotheism among the Greeks*; S. B. GOULD, *Hist. of Monotheism*; E. CAIRD, *Evolution of Religion*. See also under THEISM. (A.T.O.)

Monothelitism [Gr. *μόνος*, alone, + *θέλειν*, to will]: Ger. *Monothelitismus*; Fr. *monothélisme*, *monothélisme*; Ital. *monotelitismo*. A

modified form of the Monophysite doctrine to the effect that the dual nature of Jesus Christ possessed but one energizing will.

This doctrine, brought forward as a compromise between Monophysite and orthodox parties, gave rise to a temporary truce, but was finally condemned as a heresy in 680-1, after which it disappeared.

Literature: SCHAFF, Christ and Christianity, 62; DORNER, Doctrine of the Person of Christ, ii. Pt. I; WATSON, Ketzerhistorie, IX. iii. 666; MÖLLER, in Herzog's Real-Encyc. (A.T.O.)

Monotypic and Polytypic Evolution: see EVOLUTION (in biology), and cf. PHYSIOLOGICAL SELECTION.

Monster [Lat. *monstrum*, a prodigy, a wonder]: Ger. *Missgeburt*, *Monstrum*; Fr. *monstre*; Ital. *mostro*. An organism congenitally much malformed. Cf. SPORT.

No definite line can be established between malformation and monstrosity, as the difference is one of degree only. When the malformation is so great that the appearance of the individual organism differs widely from the normal, the term monster is applied. These abnormal forms are not infrequently developed in the human species during the period of gestation. Such abnormal forms follow more or less certain types, and have therefore been classified. The study of monstrosities is called TERATOLOGY (q. v.).

While ordinarily used in regard to anatomical malformations, it is also employed in a psychological sense, especially in reference to absence or perversion of the moral and emotional sensibilities. (C.S.M.—J.J.)

ROUX, Gesammelte Abhandl. ü. Entwickelungsmech. d. Organismen (1895); TARUFFI, Storia della Teratologia (1895). (E.S.G.)

Montaigne, Michel Eyquem, Seigneur de. (1533-92.) Born at Périgord, France, and educated at Bordeaux, he studied law at fifteen, and in 1554 became a counsellor in the Parliament of Bordeaux, where his friendship for Étienne de la Boétie began. Resigned in 1570 and devoted himself to literature. In 1580 he travelled in Germany, Switzerland, Italy, and the north of France. In 1581 became mayor of Bordeaux. Fled from the city, 1585, to escape the plague.

Montanism: Ger. *Montanismus*; Fr.

Montanisme; Ital. *Montanismo*. The doctrine of a sect of Christians, in the second century, founded by Montanus, which combined belief in the continuance of the miraculous gifts of the Apostles and in the personal inspiration of Montanus, with the expectation of the second coming of Christ in the near future and the practice of a rigorous ascetic discipline.

The significance of Montanism lies almost exclusively in its claim of a continuance of miraculous gifts in the Church. This was, on the one hand, an anticipation of the ecclesiastical doctrine of infallibility, and on the other, the first assertion of the principle of the progressive revelation of Christian truth. Newman takes this view, while Ritschl, in Harnack's words, regards it 'as a reaction against secularism in the Church and an effort to conserve the principles of primitive Christianity.'

Montesquieu, Charles Louis de Secondat, Baron de. (1689-1755.) Educated in the Oratorian college of Juilly and (in law) at Bordeaux. Became counsellor in the Parliament of Bordeaux, 1714, and president, 1716. Chosen to the Academy, 1728. Travelled in Germany, Austria, and Italy, spending two years in England, studying methods of government. Returned to France, 1731, and devoted himself to historical study.

Mood [Lat. *modus*]: Ger. *Stimmung*; Fr. *humeur*; Ital. *umore*. Pronounced emotional tone not connected with particular mental objects, and having much colouring from organic sensations.

Literature: STOUT, Manual of Psychol., 286 f.; the titles given under EMOTION, and in BIBLIOG. G, 2, k. (J.M.B., G.F.S.)

Mood (in grammar): see CONJUGATION (linguistic), and INFLECTION.

Mood (in logic) [Lat. *modus syllogistici*, trans. of Aristotle's *τρόπος συλλογισμού*]: Ger. *Schlussmodus*; Fr. *mode*; Ital. *modo*. Kind of SYLLOGISM (q. v.), varying with the quantity and quality of the premises and conclusions.

In each syllogistic FIGURE (q. v.) sixteen combinations are possible of the propositions A, E, I, O. Only certain of these are recognized as valid, to which names are given as cited under MNEMONIC VERSES AND WORDS (q. v., 8). For the 'rules' for testing the validity of the various modes see SYLLO-

GISM. Historical citations on the topic may be seen in Eisler, *Wörterb. d. philos. Begriffe*, 'Schlussmodi.' (J.M.B., C.L.F.)

Moral and Morals: see ETHICS, and ETHICAL THEORIES. Cf. MORAL SCIENCES.

Moral Argument (for the existence of God): see THEISM.

Moral Courage: see COURAGE.

Moral Faculty: Ger. *moralische Fähigkeit*; Fr. *faculté morale*; Ital. *facoltà morale*. The mental capacity or 'power' in the individual by which is apprehended the moral quality of actions or the distinction between right and wrong.

The term is used by Butler as a general term which implies no special view of the nature of the power of distinguishing between right and wrong. 'That we have this moral approving and disapproving faculty is,' he says, 'certain, from our experiencing it in ourselves and recognizing it in each other.' Its existence is presupposed, 'whether called conscience, moral reason, moral sense, or divine reason, whether considered as a sentiment of the understanding or as a perception of the heart, or, which seems the truth, as including both' (*Diss. on Virtue*, apud init.). The term, which was frequently employed by the English moralists and Scottish philosophers, has for the most part fallen out of use with the decay of the 'faculty psychology.' Cf. CONSCIENCE, MORAL SENSE, and PRACTICAL REASON. (W.R.S.)

Moral Insanity: Ger. *moralischer Irrsinn*; Fr. *folie morale*; Ital. *pazzia morale*. 'A morbid perversion of the natural feelings, affections, inclinations, temper, habits, moral dispositions, and natural impulses, without any remarkable disorder or defect of the intellect or knowing and reasoning faculties, and particularly without any insane illusions or hallucinations' (Prichard, 1835).

The word moral was used not in the sense of ethical, but as a contrast to 'delusional' or 'incoherent,' referring to Locke's remark: 'Madmen do not appear to have lost the faculty of reasoning; but having joined together some ideas very wrongly, they mistake them for truths, and they err, as men do that argue right from wrong principles.' The cases which Prichard alludes to are mostly mild forms of manic-depressive insanity (see MANIA), of which he describes very plainly the ups and downs of exaltation and depression with absence of any delusion or immorality. Other cases have merely 'a liability to violent fits of anger breaking out without

cause and leading to the danger or actual commission of serious injury to surroundings, persons,' or criminal impulses (irresistible impulse to break things, to put fire to buildings, to commit every kind of mischief, to steal), or nostalgia, erotomania, satyriasis, and nymphomania (unusual intensity of sexual passion). Prichard also includes epileptic irascibility and finally the senile insanity in which 'the pious become impious, the constant and happy discontented and miserable, the prudent and economical imprudent and ridiculously profuse, the liberal penurious, the sober drunken.' Further, he mentions eccentric wayward and antisocial individuals in whom heredity of mental diseases, and even previous attacks of insanity and profound change of character, are demonstrable.

The term 'moral insanity' is now commonly replaced by the terms respectively which characterize the actual psychosis of which it forms a manifestation. As illustrated above, it occurs symptomatically in hypomania (see MANIA), in the restless and adventurous period of certain types of general paralysis or senile dementia, with prominent deterioration of character, in licentiousness and sexual crimes, stealing, &c., or in alcoholic deterioration; and in paranoia (acts of persecution for supposed wrong or of inspiration, as in the well-known case of Guiteau, the murderer of President Garfield) or in epilepsy (impulsive violence, stealing, &c.). There are, further, some cases which are now commonly thought of as real instances of 'moral insanity,' in which, notwithstanding normal educational opportunities, a peculiar deficiency of appreciation of moral values lasts beyond childhood, or crops out at the period of puberty, when a larger scope of individual and social responsibilities may normally be expected to arise. These cases belong to the category of constitutional psychic inferiority, and are properly classed as moral imbecility, whether they are combined with or occur in the absence of intellectual, emotional, and impulsive deficiency. In these cases there is an inability of adaptation to the demands and existing order of society, a predominance of vicious, antisocial, and even criminal instincts, resulting in discomfort and injury to those immediately affected and to society at large. Various forms of the defect occur: there may be a complete lack of appreciation of right and wrong, or a general appreciation of the difference without any desire to act accordingly, or a desire to act differently, but

no sufficient power of will to convert motive into action, i.e. a sort of moral abulia. Sexual immorality, prostitution, alcoholism, disregard of family and other duties, a fiendish passion for making trouble, stealing and forging and lying (Delbrück's *pseudologia phantastica*) are the most frequent types of action expressive of moral insanity.

A special reason for the survival of the term is its antagonism to certain concepts of English law which ignore completely the undeniable fact that there are states of merely diminished responsibility. This law recognizes irresponsibility only where the perpetrator is unable to distinguish between right and wrong in the act committed; while undoubtedly there are states where the criminal recognizes this distinction but is practically unable to choose between right and wrong, owing to the psychopathic conditions mentioned above.

Literature: see the topics mentioned; also DELBRÜCK, *Die pathologische Lüge und die psychisch abnormen Schwindler* (1891); BLEULER, *Über moralische Idiotie*, *Vtljsch. f. gerichtl. Med.* (1893); KAHLBAUM, *Über Heboidophrenie*, *Allg. Zeitsch. f. Psychiat.*, xlv. 461-74; ERDMANN MÜLLER, *Arch. f. Psychiat.*, xxxi. 325-77; J. C. PRICHARD, *A Treatise on Insanity* (1835); HACK TUKE, *art. Moral Insanity*, in *Tuke's Dict. of Psychol. Med.*, with literature. (A.M.)

Moral Judgment: Ger. *sittliches Urtheil*; Fr. *jugement moral*; Ital. *giudizio morale*. (1) The judgment passed upon the ethical quality of conduct or character. See CONSCIENCE. (W.R.S.)

(2) Judgments of value, WORTH (q.v.), or appreciation, distinguished from intellectual judgments, or judgments of relation, predication, assertion. Cf. JUDGMENT.

Intellectual judgments reflect what is true or consistent, moral judgments what is fit with reference to some sort of standard or ideal which may not be realized at all. Even on the theory that moral judgments are not absolute but relative, there is still a distribution of values, of which the given worth is one, with reference to a scale; and this in turn implies an ideal of excellence. The common element which perhaps justifies the use of the term moral judgment is the subjective attitude of assent or endorsement which it shares with cognitive judgment. It would be better to give up the use of the term moral in application to all sorts of worth (in such expressions as 'moral sciences,' and in the French 'fortune morale'), and to re-

strict it to the ethical, as in the definition (1). The word PRACTICAL (q.v.) is being more and more used in this general sense, and that term is available. See also PRACTICAL REASON, and PRACTICAL JUDGMENT.

Moral Order: see ORDER (moral).

Moral Philosophy (and **Science**): see ETHICS, and ETHICAL THEORIES.

Moral Progress [Lat. *progressus*]: Ger. *sittlicher Fortschritt*; Fr. *progrès moral*; Ital. *progresso morale*. Advance towards perfection, or the process of the realization of the moral ideal.

Moral progress is a characteristic idea of Christian thought, both as regards the individual and society. The moral ideal being conceived as infinite, the moral life is apt to be regarded as a *progressus in infinitum*. Thus Kant deduces from the infinity of the moral task the immortality of the moral being. Of the evolution moralists, some identify progress with evolution, and hold that the progress of society and that of the individual proceed *pari passu*, their common goal being the complete adaptation of the individual to his environment. Others find in social organization a reflection of the ethical progress made by the individual, at the same time that the individual's ethical nature has arisen for the fulfilment of social utilities. According to Mill, Spencer, and Stephen, the chief factor in moral progress is sympathy; according to Alexander, progress is the result of a struggle of ideals, in which the best or fittest survive. According to Leslie Stephen, the direction of progress is from conduct to character, from the form 'Do this' to the form 'Be this.' On the other hand, the fact of moral progress, and especially the identity of progress and evolution, has been denied. Cf. Huxley's *Romanes Lecture*, 'Evolution and Ethics' (discussed by Royce, Baldwin, and others in *Int. J. of Ethics*, 1895), and A. J. Balfour's 'Fragment on Progress,' in *Essays and Addresses*, 241 ff. The pessimists hold that the course of things is from bad to worse, a regress rather than a progress. Cf. SOCIAL PROGRESS.

Literature: many works on ethics, especially by the writers named, as cited under ETHICS, and ETHICAL THEORIES; see also BIBLIOG. F, 2, f, n. (J.S.)

Moral Science: see ETHICS.

Moral Sciences: Ger. *Geisteswissen-*

schaften; Fr. *sciences morales*; Ital. *scienze morali*. Those branches of inquiry which deal with mind and conduct, as opposed to matter and life; i. e. they are contrasted with the physical and natural sciences (see SCIENCE), and are often described as the 'mental and moral sciences.'

In this general division all knowledge of man, apart from his body and its history, falls to the moral sciences; history, political economy, law, and statistics, as well as psychology, anthropology, and ethics. The psychological factors involved, such as desire, emotion, effort, and the pursuit of ideals, stand in the way of the treatment of the phenomena by the formulas of quantitative measurement. The French cover the distinction by their phrase '*la FORTUNE PHYSIQUE (q.v.) et la fortune morale.*' (J.M.B.)

Moral Sense: Ger. *sittliches Gefühl*; Fr. *sens moral*; Ital. *sensio morale*. The specific feeling—or faculty of feeling—attaching to the distinction between right and wrong.

The term moral sense is described by Adam Smith (*Moral Sentiments*) as 'a word of late formation and not yet English.' The term 'moral sense writers' is now commonly used to denote a succession of English moralists, of whom Shaftesbury and Hutcheson were the chief. The term moral sense is used by Shaftesbury (in the margin of his *Inquiry concerning Virtue*) as synonymous with 'sense of right and wrong,' and as indicating a feeling in the individual which accompanies right or wrong action or disposition. It is spoken of as a 'reflex affection,' because the 'objects of the affection' are 'the very actions themselves, and the affections of pity, kindness, gratitude, and their contraries, which are brought into the mind by reflection.' 'So that, by means of this reflected sense, there arises another kind of affection towards those very affections themselves, which have been already felt, and are now become the subject of a new liking or dislike' (*Inquiry*, Bk. I. Pt. I. § 3). The doctrine of a moral sense was, however, most fully elaborated by F. Hutcheson in three works—*Inquiry into the Original of our Ideas of Beauty and Virtue* (1725), *Essay on the Nature and Conduct of the Passions and Affections with Illustrations on the Moral Sense* (1728), and *System of Moral Philosophy* (published posthumously in 1755). The moral sense is described by him as a 'determination of our minds to receive amiable or disagreeable ideas of objects.' 'By a superior sense,

which I call a moral one, we perceive pleasure in the contemplation of such [*sc.* good] actions in others, and are determined to love the agent (and much more do we perceive pleasure in being conscious of having done such actions ourselves) without any view of further natural advantage from them' (*Inq.*, 106, 124). It is described as a 'taste or relish' (*Syst.*, i. 59); and its 'gratifications are constituted by nature our most endurable pleasures' (*Essay*, xix). In Hutcheson's latest work the reflex nature of the moral sense is most distinctly brought out, and it is said to have reference to 'affections' or dispositions, rather than to actions (i. 97). Adam Smith replaces this view of a distinct moral sense by his doctrine of sympathy (*Mor. Sent.*, VII. iii. 3). (W.R.S.)

Moral Statistics: Ger. *moralische Statistik*; Fr. *statistique morale*; Ital. *statistica morale*. A branch of practical STATISTICS (q.v.). An examination of the French criminal statistics by the statistician Guerry in the year 1829 showed that the conduct of the population from a moral point of view might be made a subject of statistical investigation. Hence arose moral statistics.

The development of statistical inquiry among civilized communities within the present century has led to a corresponding expansion of the field of moral statistics. In addition to criminal statistics, moral statistics now include the statistics of suicide, of illegitimacy, of divorce, and in fact of any manifestation of human conduct in its moral aspects which admits of enumeration and effective comparison. Moral statistics draw material from almost every department of practical statistics. The birth-rate belongs to the statistics of population, but it is also of great value to the moral statistician. It not merely supplies him with the number and ratio of births which take place outside bonds of wedlock; it also assists him to discover how far the natural increase of the community is checked among the married population by artificial means. Ecclesiastical statistics may also be utilized by the moral statistician. The growth or decay of ecclesiastical or secular marriages is in its way a symptom of the moral condition of the community. Trade statistics, where they are concerned with the consumption of alcoholic drinks or with the statistics of luxuries, are to a certain extent an index of the moral standard of the people. Educational statistics and the statistics of pauperism have a close relation to moral statistics. Conduct depends

MORAL STATISTICS

on vital, intellectual, economic, religious, and political conditions, and the statistical materials which these conditions supply are all of value to the moral statistician.

Moral statistics admit of almost as much subdivision as society itself, and the subdivisions run upon somewhat similar lines. Morality is a characteristic of the human race. Hence moral statistics are international in character, and the first subdivision of moral statistics may be appropriately described as international moral statistics. The results of international moral statistics, in so far as it is possible to get results, are arrived at by the method of comparison. All civilized communities collect statistical material which enables them to give the ratio of crime, suicide, illegitimacy, divorce, &c., occurring in such communities within a strictly defined period of time. The task of international moral statistics is to collect these ratios and to present them in a comparative form. When this has been done, we see the rate of crime, the rate of suicide, the rate of illegitimacy, and so on, which exist in the civilized world at a given time, and the difference between one nation and another with respect to these ratios. Let us take the international statistics of homicide as an example.

Homicides per million inhabitants.

Italy, 1880-4	96
France, 1880-4. . . .	15
Germany, 1882-4. . . .	10
Spain, 1883-4	76
Austria, 1877-81	24
England, 1880-4	5
Ireland, 1880-4	10
Scotland, 1880-4	5

This table, which is extracted from Professor Ferri's *L'Omicidio*, sheds considerable light on the international distribution of homicide. It is not, however, to be taken as an absolutely accurate representation of the facts. Penal law, penal procedure, the definitions of crime, differ in different communities. These differences affect the statistical returns, and all that we get as a result of international statistical comparisons is an approximation to the facts. But approximations, although falling short of complete accuracy, are often of great value. They lead the student of moral statistics to inquire into the various conditions which tend to produce a high or a low rate of homicide or suicide, or whatever the subject under consideration may be. The conditions, for instance, which make homicide vary so much

in different countries may be partly climatic, partly racial, partly social, partly economic. International statistics, although they are too incomplete to be taken as a test of the position occupied by nations in the scale of morality, are, nevertheless, an invaluable means of awakening communities to the moral evils which exist within them; and when such statistics afford a clue to the conditions which produce these evils, they may help to pave the way for removing them.

National moral statistics embrace a narrower area, but are more accurate in character than international statistics. In national statistics the accuracy of the returns is not disturbed to the same extent by differences of method in the collection and arrangement of the statistical material. Practically the same method of collection and arrangement may exist for a considerable period of time. When this is the case, a comparison of the moral conditions of one period with the moral conditions of another attains a considerable degree of accuracy. This is exemplified, for instance, in the statistics of illegitimacy in England and Wales during the last quarter of a century. During that period there has been little or no change in the method of collecting the statistical data relating to the general birth-rate. In the quinquennial period 1876-80 the rate of illegitimate births to the total number of births was 47 per 1,000. In the quinquennial period 1893-7 the illegitimate birth-rate had sunk to 42 per 1,000. It may be fairly assumed from these returns that the vice of illegitimacy is diminishing in English social life. But it would be hazardous to argue from this fact that there has been a corresponding improvement in sexual morality as a whole. It is possible that this may be the case, but the decrease in the proportions of illegitimacy is not in itself a conclusive proof of it. In England the tendency of the population for a long period has been to concentrate in large cities. Prostitution is almost entirely a product of city life. The effect of prostitution is to diminish the proportions of illegitimacy. In London, for instance, the rate of illegitimacy is lower than it is in the population as a whole. But it would be rash to infer from this fact that the morality of the sexes is on a higher level in the metropolis than in other portions of the kingdom where illegitimacy is more prevalent. While illegitimacy is comparatively low in large English cities and comparatively high in the country districts, the reverse

is the case in France and also in Germany. M. Levasseur, in his remarkable demographic work *La Population française*, gives the following table exhibiting the proportions of illegitimacy in urban and rural France:—

Illegitimate births per 1,000 in 1879-83.

Department of the Seine . . .	24
Urban population of France . .	101
Rural population of France . . .	42
Average for France as a whole .	74

Notwithstanding the fact that prostitution tends to diminish illegitimacy, we find that it is urban and not rural France which has the highest proportion of illegitimate births. This leads the moral statistician to the conclusion that prostitution is only one of the conditions affecting the movement of illegitimacy. As far as France is concerned, M. Levasseur says that the other conditions are the growth of large cities, the development of industrialism, the obligation of military service, the weakening of the religious sentiment, an indisposition to accept the burdens of family life, the temptations of luxury for poor girls, and the prescriptions of the French law, which forbids 'la recherche de la paternité.' In addition to these causes the high rate of illegitimacy in many French and German cities is to be attributed to the growth of certain political and social ideals among the masses of the population. In certain anarchist and socialist circles the ideal of normal sexual relationship is regarded not as a legal but as a purely voluntary union. Where this ideal is practised, the offspring of such relationships are illegitimate in the eye of the law; and if this ideal is practised to any considerable extent, it at once heightens the proportions of illegitimacy. In such cases a high ratio of illegitimacy does not necessarily presuppose a correspondingly low level of sexual morality. It will also be observed, in connection with the statistics of illegitimacy in France and England, that international moral statistics sometimes assist us to interpret the meaning of national statistics, and to widen our grasp of the conditions which contribute to produce the statistical results.

In national moral statistics the difficulty of arriving at accurate results arises from the fact that we cannot compare contemporaneous periods as in international statistics, but must compare different periods, as, for example, the present with the past, or one period in the past with another period in the past. Even where the collection and arrangement of the

statistical material remains the same, the material itself is often considerably affected by changes in the law, or changes in the administration of the law, or by a combination of both. It is the operation of these circumstances which makes it so difficult to estimate exactly the national movement of crime over lengthened periods. Criminal law in the course of a generation undergoes considerable change. Old enactments are repealed or modified in their operation. New enactments are made. The development of legislation is constantly adding new crimes to the statute book, and to a limited extent removing old ones. In England the coming into force of the compulsory Education Act, which compelled every parent under a penalty to send his child to school, at once added enormously to the number of persons tried and convicted before the criminal courts. The growth of industrial legislation has worked in the same direction. Employers' liability Acts, factory and workshop Acts, mines and quarries Acts, merchant shipping Acts, are all Acts with penalties attached to them, and all of them have tended to add to the ratio of persons coming before the criminal courts. These facts must all be borne in mind and due allowance made for them when comparisons are made between two periods where the legal conditions differ under which the population live. If the moral statistician looks merely at the criminal returns relating to the total volume of offences for trial before the criminal courts, he will see that these offences are increasing; and if he does not look outside these returns, he will be led to the conclusion that crime, in its widest sense, is increasing, and that the morality of the population is deteriorating. If, on the other hand, the moral statistician looks merely at the growth of social legislation, if he counts up the number of education Acts, of industrial Acts, of municipal Acts passed into law in order to improve the intellectual and physical condition of the population, he will come to the conclusion that the moral sense of the community is developing, otherwise such Acts would not have come into existence. Both views would be one-sided, because neither view takes account of all the statistical material at hand for forming a comprehensive judgment. On the one hand, the statistics of social legislation show the growth of the sentiment of social duty; the statistics of the growth of offences, on the other hand, show the moral danger of bringing larger and larger sections of the

population under the lash of the criminal law. The ultimate problem in this case would be whether the danger is greater than the benefit, or the benefit than the danger.

The examples which have just been given show to what extent national moral statistics are affected by changes in legislation when these statistics cover a considerable period of time. They are similarly affected by changes in the administration of the law. If a law is very rigidly administered, if all offences under it, however trivial in character, are prosecuted without exception, the annual return of trials and convictions for such offences will be at a maximum. If, on the other hand, the law is administered with forbearance and consideration, the annual return of offences will not be nearly so high. And yet in both cases exactly the same number of offences may have been committed. One of the principal reasons why the juvenile population in English prisons has diminished so much in recent years, is that magistrates and judges are now exercising greater patience and forbearance with the juvenile offender. Instead of sending him to prison, they are cautioning him, or fining him, or committing him to an industrial school. In the same way the adult prison population in England has been greatly diminished by resorting on a larger scale to the penalty of fining rather than the penalty of imprisonment, and by the growing practice of passing shorter sentences on offenders committed to prison. All these circumstances have to be taken into consideration when we begin to interpret the contents of national moral statistics. The statistics themselves are little more than the raw material. They are meaningless and misleading until we have made a study of all the circumstances connected with them and affecting them. Comparisons between one period and another of the moral statistics relating to the national life must never be undertaken till a preliminary study has been made of all the conditions bearing upon the returns. It is the neglect of this elementary precaution which has done so much to bring statistical methods, when applied to social phenomena, into contempt.

A third subdivision of moral statistics is the moral statistics of the various localities, whether they are provinces, states, or counties, of which a nation is composed. The local or, as it is often called, the geographical distribution of divorce, suicide, crime, &c., is very uneven. In some parts of the country the

ratio is above the average for the whole population; in other districts it is below the average. It is the business of moral statistics to attempt to account for the conditions which produce these differences. In France, for instance, the rate of suicide is highest in the departments around the capital, and lowest in the extreme west and in the departments along the southern frontier. In the United States, homicide is highest in the south and west, and lowest in the east and north. In England, illegitimacy reaches its lowest in such counties as Middlesex and Essex, and its highest in Cumberland and Hereford. In the case of local moral statistics, all the statistical material is collected and arranged in the same manner in European communities, and thus lends itself to exact comparisons between district and district. In the United States this is not the case. Before interstate statistics can be compared, differences in legislation and in administration must be taken into consideration. But in local statistics, where law, administration, and the arrangement of the statistical material are identical, the problem before the moral statistician is considerably simplified, and his results are much more assured.

The moral statistics of classes, trades, and professions form another subdivision of moral statistics. Bosco, in his monograph on homicide in the United States, shows that the unskilled labourer is most addicted to homicide, and that this kind of crime is most rare among the liberal professions. Yet another subdivision of moral statistics is the moral statistics of the population according to civil condition—married or single, widowers or widows. In the third volume of the *Zeitschrift für Socialwissenschaft*, Julius Wolf points out that in Germany widows are more addicted to crime, suicide, and prostitution than women who have husbands. Wolf accounts for the moral degradation of widows by attributing it to the wretched economic conditions into which a large proportion of them are plunged by the loss of their husbands.

We have another division of moral statistics in the moral statistics of sex and age. Moral statistics of every kind exhibit the difference which exists between the sexes with respect to certain immoral or abnormal kinds of conduct. Such statistics show that women are on the whole less addicted to crime and suicide than men. They also show that the criminal age, and the age when suicide reaches its maximum, is not the same for

women as for men. But moral statistics, while giving these facts, do not give the explanation of them. This explanation must be sought in the social economic and biological condition of the sexes. In recent times the attempt to account for certain kinds of human conduct on biological grounds has led to an extension of the domain of moral statistics. Criminal anthropology is the name usually given to studies of this kind. Criminal anthropology attempts to explain the criminal act by a reference to peculiarities and abnormalities in the structure and functions of the individual who commits the crime. All these peculiarities are collected and tabulated; and when a convicted person exhibits a combination of them, he is declared to be a born criminal. One anomaly, or even two anomalies, are not necessarily sufficient to relegate the offender to this unfortunate class, and in most cases external conditions must co-operate with the anomalous personal conditions. But when the external and the personal conditions are both present, it is contended by the criminal anthropologist that the criminal act is the inevitable result. In many instances the theories of criminal anthropology have been carried too far, and the data on which these theories are based have not been subjected to a sufficiently rigid statistical and scientific scrutiny. But after all deductions have been made on this account an element of truth remains in the teachings of criminal anthropology. It is undoubtedly true that individuals of a degenerate physical or mental type are handicapped in the economic struggle for life. They usually find it hard to get or to retain employment. This fact alone has a powerful effect in driving them into the ranks of crime or suicide or insanity. It is possible that some creatures of this type may be purely the victims of a defective organization. But in the case of criminals it is practically impossible to prove this. All that can at present be adequately proved is that adverse biological conditions, unless counteracted by favourable social conditions, lead to social adversity, and social adversity in its turn leads to crime.

A summary of the preceding observations with reference to the subdivisions of moral statistics shows that such statistics may be classified in the following order:—international moral statistics; national moral statistics; local moral statistics; the moral statistics of classes, trades, professions; the moral statistics of civil condition; the moral statistics

of sex and age; the moral statistics of biological condition. This classification might possibly be enlarged, but it contains the main heads of moral statistical inquiry.

A fruitful source of inquiry in the domain of moral statistics is the confrontation of one set of moral statistics with another; such, for instance, as the confrontation of the ratio of divorce and separation with the ratio of suicide, or the ratio of illegitimacy with the ratio of pauperism, or the ratio of education with the ratio of crime. When these confrontations are made, the problem is to discover whether there is merely a parallelism between the two ratios or a real causal connection.

Moral Theology: Ger. *moralische Theologie*; Fr. *théologie morale*; Ital. *teologia morale*. (1) The doctrines of theology developed as postulates of the moral as distinguished from the logico-speculative reason. (2) That branch of systematic theology which treats of morals in its theoretic and practical forms.

Moral theology in the first sense had its distinctive origin in Kant's separation of speculative and practical reason, and his derivation of the postulates of religion from the latter. This position was further developed by Lotze, in whose system the basis of theology is the judgment of worth or value. The modern Ritschlian movement in theology is in this sense moral rather than speculative.

In the second sense, moral theology includes ethics as a branch of Christian doctrine developed either dogmatically or speculatively, and casuistry, which treats of the application of ethical principles to practice.

Literature: KANT, Critiques of Pure and Practical Reason, and Religion within the Limits of Pure Reason; LOTZE, Metaphysics, and Philos. of Religion. Also see RITSCHLIANISM. (A.T.O.)

Morality [Lat. *moralis*, moral]: Ger. *Sittlichkeit*; Fr. *moralité*; Ital. *moralità*. (1) The relation of conduct or character to the moral standard. For different views as to the nature of the moral standard see ETHICAL THEORIES. (W.B.S.)

(2) Disposition or conduct which is ethically good, contrasted with immorality. (J.M.B.)

Morality, Moral Obligation, Moral Consideration (in law): Ger. *Naturalobligation* (moral obligation), (*gesetzliche*) *Moralität*; Fr. *obligation naturelle* (moral obligation), *moralité légale*; Ital. *obbligo* (in ethics), *moralità legale*. A Moral Obligation is a duty, for the violation of which the law gives no redress; a Moral Consideration is a just but not a legal consideration of a contract, and which therefore will not suffice to support an action in the contract; Morality, so far as such a conception as legal morality exists, is conformity of external conduct to the rules of law and equity (using 'equity' in its technical signification of the principles upon which courts of Chancery or equity act). See Pollock, *Jurisprudence*, chap. ii. 44.

Law and morality have in great part a common descent from custom. 'The word *mos*, from signifying what is customary, has come to signify what is right' (Markby's *Elements of Law*, § 118). The English chancellor was originally the keeper of the king's conscience, and decided causes upon his view of right. From the long succession of decisions in Chancery, certain principles of 'equity' were developed or generalized, which became accepted rules for all equity courts, and have replaced any direct appeal to the principles of morals (Pomeroy, *Equity Jurisprudence*, ii. §§ 49, 62, 424; Smith, *Right and Law*, § 49 ff.; Holland, *Jurisprudence*, chap. v. 50). Pothier, in his *Traité des Obligations*, art. préI., distinguishes between obligations imparfaites, like gratitude, which do not even bind one in conscience, and obligations naturelles, which are real duties, though not enforceable by law.

Literature: works above cited, and BEN-

THAM, *Mor. and Legis.*; MAINE, *Ancient Law*, chap. i; CUQ, *Les Institutions juridiques des Romains*, Liv. I. iii, III. ii, and 'Conclusion.' (S.E.B.)

Morbid [Lat. *morbidus*, sickly, from *morbus*, a disease]: Ger. *krankhaft*; Fr. *morbide*; Ital. *morbo*. (1) Abnormal, diseased; thus morbid psychology is used as synonymous with ABNORMAL PSYCHOLOGY (q.v.). A morbid train of thought is one with an unwholesome trend, or one characteristic of an abnormal or an insane mind. (2) Specifically applied to an over-sensitive and usually morose state in which there is much self-conscious rumination and in which an exaggerated significance is attached to emotional fluctuations. (J.J.)

More, Henry. (1614-87.) An English divine, educated at Eton and Christ's College, Cambridge, where he held a fellowship from 1639.

Morphology [Gr. *μορφή*, form]: Ger. *Morphologie*; Fr. *morphologie*; Ital. *morfologia*. The philosophical study of comparative anatomy, being chiefly concerned with the genesis and homology of the structure and parts of living organisms. First used by Goethe, in 1817, to denote the study of form.

Literature: HAECKEL, *Gen. Morphologie* (1868); CARUS, *Gesch. d. Zool.*; art. 'Morphology' in *Encyc. Brit.* (9th ed.). (E.S.G.)

Mosaic Theory (of vision): Ger. *mosaische Theorie (des Sehens)*; Fr. *théorie mosaïque (de la vue)*; Ital. *teoria mosaicistica (della visione)*. A theory put forth by Johannes Müller to explain the vision of Arthropods possessed of compound eyes.

Insects, Crustaceans, and other Arthropods are provided with eyes having many facets, under which are grouped retinal elements surrounding a crystalline cone. According to the Mosaic theory, the whole image seen is made up of a number of minute points, corresponding to the facets, which combine to form one picture. According to the rival theory advocated by Gottsche and others, each element of the compound eye yields a small but complete image.

Literature: J. MÜLLER, *Zur vergl. Physiol. d. Gesichtssinnes* (1826); GOTTSCHKE, *Beitr. z. Anat. u. Physiol. d. Fliegen u. Krebse*, Müller's Arch. (1852); J. LUBBOCK, *The Senses of Animals* (1888). (E.S.G.)

Motion [Lat. *motus*, moved]: Ger. *Bewegung*; Fr. *mouvement*; Ital. *moto* (on all the foreign equivalents, cf. MOVEMENT). From the point of view of physics, motion is change in the relative position of two bodies ;

but this, as Locke truly observes, is to translate and not to define, for 'change' and 'position' already involve the idea of motion, which cannot in strictness be defined, but only exhibited in concrete experience. Motion involves the ideas of space and time, between which it seems in a sense to mediate. We measure space by the time which a body takes to move from one part of space to another. In doing so our ultimate standard of time is 'the constant and regular succession of ideas in a waking man' (Locke, *Essay*, ii. 14, II); but a convenient objective measure of time is subsequently found in certain uniformly recurring spatial movements, such as those of the earth and the sun.

The part of physics which deals with the theory of motion in its purely geometrical aspect is called kinematics. 'When the mutual action between bodies is taken into account, the science of motion is called KINETICS (q. v.), and when special attention is paid to force as the cause of motion, it is called DYNAMICS' (q. v.) (Clerk Maxwell, *Matter and Motion*, art. 36).

Heraclitus is the first philosopher to insist on the fact of movement as constituting the most characteristic aspect of the universe; but he is content to state the general fact of change or process without distinguishing its different forms. Treating it, moreover, as an ultimate fact, he does not inquire into the cause of motion (*ἄθεν ἡ ἀρχὴ τῆς κινήσεως*). The Eleatics, on the other hand, treated the fact of motion as an illusory appearance, and the arguments of ZENO (q. v.) against its possibility—founded chiefly upon the infinite divisibility of space—are among the best known pieces of ancient dialectic. The Atomists, by reducing all change to movement of the atoms in empty space, were the first to formulate the modern physical conception of motion. They conceived this motion as eternal, and found it sufficiently explained by the fall of the atoms through infinite space. Empedocles sought a cause of motion in the mythical forces of love and hate; and Anaxagoras, by tracing it to the action of *νοῦς*, or mind, made an epoch in Greek philosophy, even though mind was conceived by him quasi-materialistically as communicating a mechanical impact to his atomic elements. The most instructive account of motion in ancient times is to be found in Aristotle, who sees in *κίνησις* the most universal characteristic of nature. Physics, as contrasted with First Philosophy, deals with existence not in itself,

but in so far as it participates in *κίνησις*. Taking *κίνησις* in its widest sense, he distinguishes three varieties—*ἀλλοίωσις*, or qualitative change; *αὔξησις καὶ φθίσις*, quantitative increase or decrease; and *ἡ κατὰ τόπον φορά*, or movement in space. Of these the last is the fundamental form, as involved in the others, but Aristotle does not, like the Atomists, reduce qualitative differences to purely quantitative relations of size and position. Aristotle teaches the eternity of motion, as he teaches the eternity of the world, but he seeks the explanation of motion in an eternal mover, itself unmoved (*τὸ πρῶτον κινεῖν ἀκίνητον*, *Physics*, 8. 6, 258 B). This eternal principle of movement is God—conceived, however, not mechanically (and therefore not materialistically) as with Anaxagoras, but teleologically, as the immanent end and real explanation of the whole world-process. This is known as Aristotle's doctrine of 'mover and moved.'

The most recent philosophy still presents the same conflict between what may be called the Democritic and the Aristotelian—the mechanical and the teleological point of view. The modern mechanical theory, substituting gravitation for the 'fall' of the atoms, would reduce the world to a physical problem of the continual redistribution of matter and motion. But gravitation is after all a law rather than a force; and like all scientific laws, it furnishes us with a generalized description of what happens, but does not (at least, ought not to) profess to explain these happenings in the sense of assigning their true cause. The opposite view is that the true cause or ultimate explanation of any process always involves the conception of end; as Aristotle insists, the end, though apparently the last resultant, is first in the order of real existence.

Descartes' doctrine that the quantity of motion in the universe is constant, and the controversies to which it gave rise, belong to the history of physics rather than to that of philosophy. Cf. CONSERVATION, ENERGY, PHORONOMY, and ACTIVITY. (A.S.P.P.)

Motion (illusions of): see ILLUSIONS OF MOTION AND MOVEMENT, I.

Motion and Rest (in physics): Ger. *Bewegung und Ruhe*; Fr. *mouvement et repos*; Ital. *moto e riposo*. Motion is change of place; a phenomenon too familiar to need detailed definition. See MOTION. Rest is absence of motion.

Motion has two properties:—

(1) It is *continuous*: no body changes its position from a point *A* to another point *B*

except by passing through an unbroken series of intermediate positions, which, if the body is regarded as a point, will form a line.

(2) Motion can be apprehended only as *relative*. In space itself there is no such thing as sameness of position. Position can be defined only with respect to the position of a body. Given one such body, and only one, there will be no way of determining whether it is in motion or at rest. Given two bodies, either may be in motion relative to the other; but of neither can we say that it is in motion or at rest when considered by itself. Motions on the earth's surface are familiarly conceived with reference to that surface. But the earth itself is in motion on its axis, and this axis moves around the sun. Thus motions around us are very different when we refer them to the earth's centre, or to the sun. The sun itself is in motion relative to the other stars, and thus we may have another link in the chain, the end of which we cannot conceive. (S.N.)

Motive [Lat. *motus*, from *movere*, to move]: Ger. *Motiv*; Fr. *motif*, *mobile* (AFFECT, q. v.); Ital. *motivo*. (1) Any conscious element considered as entering into the determination of a volition.

(2) Any conscious END (q. v.) considered as entering into the determination of a volition.

The first definition is better and is recommended, principally for the reason that the term end is sufficient to express the second meaning. There is great confusion of the two meanings with each other. The second usage arises from the attempt to prove that all motives are intellectual, and of the nature of ends. There is need, however, for a term of the wider signification; and the division of ends from other motives, in the first sense, may be marked by the term AFFECT (q. v.), as is recommended under that topic. Affects are the motives, however uncognized and affective—such as organic sensations, vital sensations, dispositions of an emotional or conative sort, &c.—which do not have the character of presentation in idea. They also include the negative determining or limiting (massgebende, Wundt) conditions of a voluntary decision. Ends, on the other hand, are the motives which do have the character of presentation in idea.

The broader definition (1) had early statement in Bentham (*Introd. to the Princ. of Mor. and Legisl.*, 1789, chap. x. § 1), i. e. 'Anything that can contribute to give birth to, or even to present, any kind of action,' or 'Anything whatsoever which, by

influencing the will of a sensitive being, is supposed to serve as a means of determining him to act, or voluntarily to forbear to act, upon any occasion.' (J.M.B.—G.F.S.)

When two or more ends are presented as desirable, either simultaneously or in immediately succeeding states of consciousness, we have the experience known as 'conflict of motives,' the conflict being terminated by a voluntary decision or choice. The denial of the appropriateness of the term 'conflict of motives' is due to the limitation of the term 'motive' to an experience in which the motive actually issues in action—a limitation which appears to be an unnecessary restriction of the prevailing use of the term. The term 'controlling motive,' applied to that motive to which the decision most nearly conforms, is unfortunate, since it is difficult to say what it controls, and also since the course chosen is rarely true to any one of the alternative motives. (W.R.S.—J.M.B.)

Literature: the textbooks of psychology and ethics. For the distinction between the two definitions see citations under AFFECT. Cf. STOUT, *Manual of Psychol.*, Bk. IV. chap. x; D. G. RITCHIE and others in *Int. J. of Ethics*, iv. 89, 229. A notable discussion from the point of view of the second definition is that of GREEN, *Prolegomena to Ethics*, Bk. II. chap. i. (J.M.B.—W.R.S.)

Motor [Lat. *motum*, from *movere*, to move]: Ger. *motorisch*; Fr. *moteur*; Ital. *motore*. Pertaining to the apparatus and consciousness of action.

The term is opposed to sensory, which is applied to the apparatus and consciousness of the reception of experience. Motor is used in various phrases, such as VASO-MOTOR (q. v.), 'motor consciousness,' 'motor reaction.' It characterizes also the type of psychological theories which explain complex mental products more or less in terms of 'motor elements' (i. e. sensations from muscular and physiological movements), and of conations. See MOVEMENT, and cf. SENSORY AND MOTOR ELEMENTS. (J.M.B., G.F.S.)

Motor Intuition: see INTUITION (in psychology).

Motor Type: see TYPE (mental).

Movement [Lat. *movere*, to move]: Ger. *Bewegung* (used also for motion); Fr. *mouvement*; Ital. *movimento*. (1) Motion of any sort.

(2) Organic action; cf. MOVEMENT (in physiology).

(3) Action of the motor apparatus.

There is great confusion as between these meanings in all the languages cited. Movement is used (1) in the broadest possible sense to cover mechanical motion. But there is a distinct tendency to restrict the term motion to the mechanical, and to use movement (2) for the action of organisms, in which vital or psychological processes complicate the phenomena. The further restriction contained in definition (3) has arisen in psychology, where the distinction between the motor and the sensory processes, and their correlative psychological states, has made the term movement in this sense convenient. On the whole, it is safe to recommend that the term be restricted in psychology to meaning (3); that, nevertheless, its use in sense (2) be recognized in physiological discussions; but that, so far as possible, the distinction between movement and motion be observed, the latter having exclusive application to the objective phenomena of change of place. For example, I make a movement of my arm; but I observe by sight the motion of a bird through the air. For the midway cases of one's observation of his own movement, the term movement is preferable, as in the phrases 'movement sensations,' 'illusions of movement,' &c.; yet when these are classed with other phenomena of motion, the latter term should be applied to them.

Psychological theories in the realm of movement are largely concerned with the formulations respecting conation—with reflexes, instincts, and voluntary determinations—on the side of consciousness; and with those of reaction, dynamogenesis, theory of kinaesthetic sensations and equivalents, on the side of the organism; together with the motor and 'action' theories, which assign to elements of motor content—attitudes, dispositions, habits, accommodations, &c.—important rôles in mental development. The discussions of effort, fatigue, and emotional expression, and the investigations into the localization of the motor areas of the brain cortex, have emphasized the tendency to make active accommodation and its requirements at least as essential as are the cognitive and receptive functions—a point of view quite undeveloped until this generation. The two sides of the mental life, however, are more sharply distinguished for the purposes of theory than from any fundamental difference of kind; for the movement elements are throughout sensational in their origin, and accordingly the reduction of the motor to the sensory con-

tinuum seems to be legitimate. The theoretical question then concerns the determination of the sensational elements—muscular and kinaesthetic—which, in their function as determining motor accommodation and control, minister to the progress of the mental life. This is where motor or action theories get their value; and it is being fully recognized in current discussion.

The analysis of a given movement function, of which HANDWRITING (q. v.) may be taken as a good example, results in the establishment of certain factors: (1) a 'copy series,' which is held up to be reproduced. (2) The acquisition, by a process of selection through experimentation, of the series of kinaesthetic equivalents required for reproducing the 'copy-series'; this we suggest calling the 'efficient series.' (3) The association of the efficient series with any 'remote' sensation series (cf. KINAESTHETIC SENSATION) which enters into the accomplished movement. (4) The establishment of a 'control series,' by which the efficient series is, term by term, held to its proper course in each successive performance of the movement. Of these elements the first is not kinaesthetic, but is a copy presented by sight, hearing, or other sense, to the reproduction of which the muscular apparatus is made to bend its energies. The second, the efficient, is gradually brought into conformity with the copy. The third comes to take the place of the copy, so that short-cuts are established, allowing the performance of the movement without the original copy-series. The fourth is found in that one—or all—of the series in question which stands to check and guide the performance of the movement. It establishes what is called the control of a movement, and may be looked at a little more closely.

The phenomenon of muscular performance with control seems to have two elements, more or less distinct from each other: release and actual control. The release is found in the conscious 'equivalent,' of the kinaesthetic order, which, when held in the attention, serves as preparation for the voluntary execution of the efficient series. Without attention successfully given to the equivalent the movement is impossible; this is shown in cases of patients who cannot move a limb unless that limb be seen—the equivalent being visual. The control, on the other hand, is not essential to the movement, but regulates it. It consists of the holding in the attention, together with the efficient series, of a

secondary or auxiliary series, seen negatively in handwriting with the eyes closed: the hand goes astray, because of the absence of the optical perception of the letters as they are made. This latter, when present, acts as control in the progress of the writing, although without it writing of an irregular and unformed kind is still possible.

The most adequate theory of the mechanism of control makes it a function of attention, which effects a synthesis of all the elements necessary for the perfected movement; certain more important series, however, taking the lead in this case or that. Interesting differences among individuals are brought out in pathological cases: to some, from their mental type, habit of performance, or emphasis in learning, one series is more necessary; to some another, in the performance of the same motor function. Furthermore, there is the fact of progressive automatization of function in the matter of control, as elsewhere. Such a semi-automatic performance starts with the same release; but the attention is given not to the details of the successive stages of the action, but to the act as a whole. In these cases, the attempt to control the movements by giving attention to the individual terms of the control series delays and disturbs the action.

See, besides the various topics mentioned, **MUSCLE**, **ILLUSIONS OF MOTION AND MOVEMENT**, and **SYNERGY**.

Literature: the textbooks of psychology, and the citations made under the various topics indicated; also **BIBLIOG. G**, 2, *p*, et al. On muscular control see under **HANDWRITING**; also **JANET**, *Automatisme psychol.*; **PICK**, *Zeitsch. f. Psychol.*, iv. (1892) 161; and in general the literature of the various motor processes and of **ATTENTION**. Distinctively 'motor' or 'action' theories are developed in the works of **MÜNSTERBERG** (see the résumé in *Grundz. d. Psychol.*, i. chap. xv, with literature); **FOUILLÉE**, *Les Idées-Forces*; **SROUT**, *Manual of Psychol.*; **BALDWIN**, *Ment. Devel.* (2 vols.). (J.M.B., G.F.S.)

Movement (disorders of). Disorders of movement may be due to irregularities in (1) the execution or control of the action, or in (2) the relation of the action to its motive impulse. The former constitute true motor disorders; the latter are of the nature of affections of the will, impairing action. See **WILL** (disorders of).

(1) True movement or motor disorders of psychological interest may be grouped as

(a) inability to execute (certain types of) movement or their imperfect and difficult execution owing to an impaired co-ordination; and as (b) inability to restrain or control (certain types of) movement. The former group includes paralyses and pareses, contractures, ataxias, &c.; the latter tremors, spasms, convulsions, movement-habits (choreic movements, tics, &c.). The movements thus considered are in most part of a voluntary type; but disorders of reflex and automatic movements also occur. Such conditions as rigidity, *flexibilitas cerea*, *cataplexy*, illustrate abnormal motor symptoms, in which a psychic element is prominent. The physiological and medical aspect of motor disorders is concerned with their relations to degenerations and irritations in spinal and higher nervous centres, to diseases of nerve and muscle tissues, and to defective nutritional conditions.

The detailed and systematic account of the nature of motor disorders is to be found in the standard works on diseases of the nervous system; they are there treated as symptoms in connection with organic and functional disabilities of nerve and nerve-centre; special attention is given to the differential diagnosis of motor affections resulting from peripheral and from central defect, and again to the correlation of the symptom-complex with the specific grade of centre involved (cortical, spinal, &c.). **PARALYSIS** (q.v.), for instance, is a most common symptom of disease of the peripheral nervous system, but may be the result of lesion of brain or cord. A paralysis affecting the distribution of one nerve, and completely so, and depriving the muscle of its tone, thus producing a flaccid palsy (without secondary contracture), is recognized as of peripheral origin. Paralyses of cortical origin have other characteristic differentia.

A group of neuroses in which the motor disorders form the most conspicuous symptoms are sometimes termed *spasmodic neuroses*. They include *chorea*, with its convulsive movements, contortions, tremors, &c.; *tetanus*, with its characteristic contracture, facial and other local spasms, the professional neuroses, such as *writer's cramp*, the convulsive tics and motor habits which often exhibit sensitiveness to contagion and suggestion. The inco-ordinations of speech seen in *stuttering*, the ataxic symptoms of *tabes*, the epileptic fit, the spasms and convulsions of *hysteria*, the motor affections due to alcohol or other poisons, illustrate the range and variety of motor defects. See the various terms cited. (J.J.)

Movement (illusions of): see ILLUSIONS OF MOTION AND MOVEMENT, II.

Movement (in physiology): Ger. *Bewegung*; Fr. *mouvement*; Ital. *movimento*. Change of form of cells or organs brought about by power inherent in a tissue to rearrange its particles; as amoeboid movement: that resembling the changes of form of an amoeba; ciliary movement, muscular movement (see MUSCLE, and cf. MOVEMENT, 2, 3). (C.F.H.)

Movement and Motion (experiments on). The following are the chief topics of experimentation upon MOVEMENT (q. v.) and MOTION (q. v.). Cf. LABORATORY AND APPARATUS, II, A, B, (c), (3-5).

(1) Movement and its perception. (a) Liminal (least perceptible) movement. The various joints differ considerably in the extent of the least perceptible passive movement; for the forefinger the threshold is 1.03° - 1.26° ; wrist, $.26^{\circ}$ - $.42^{\circ}$; elbow, $.40^{\circ}$ - $.61^{\circ}$; shoulder, $.22^{\circ}$ - $.42^{\circ}$ (Goldscheider, *Arch. f. Physiol.*, 1889, 486); the thresholds for active and passive movement are about equal (*ibid.*, 1889, Suppl.-Bd., 141); a slower rate of movement raises the threshold (*ibid.*, 1889, 369). See also EYE-MOVEMENTS. (b) Comparison of movements: repetition of movement with same hand or arm, to determine least perceptible difference in extent; relations of extent between movements of the two arms (either successive or simultaneous); relations of symmetry and form between simultaneous movements of the two arms. Cf. Loeb, *Pflüger's Arch.*, xli. (1887) 107; xlv. (1890) 1-46; Hall and Hartwell, *Mind*, ix (1884), 93; Münsterberg, *Beitr. z. exper. Psychol.*, Heft iii. 65, Heft iv. 192; Baldwin, in *Science* (1890). (c) ILLUSIONS OF MOTION AND MOVEMENT (q. v.).

(2) Motion and its perception. The motion of an object is most frequently judged by comparison with some subjective movement, e.g. following it with the eye (cf. EYE-MOVEMENTS). In special cases the two are separated: (a) Motion upon the skin when the member is at rest; experiments here include least perceptible distance (on various parts of the body), judgment of direction, judgment of rate, comparison of different distances. Cf. Hall and Donaldson, *Mind*, x. (1885) 551; Tawney and Hodge, *Psychol. Rev.*, iv. 591. (b) Motion of the body as a whole, progressive or rotary; direct perception is here limited to change of rate; in rotary motion, the least perceptible change is about 5° per second. Cf. Mach, *Grundlinien*

d. Lehre v. d. Bewegungsempfindung; Warren, *Psychol. Rev.*, ii. 273. See ILLUSIONS OF MOTION AND MOVEMENT.

(3) Execution of voluntary movement. (a) Time. See REACTION TIME. (b) Precision; effect of practice; 'cross-education,' e.g. gain of precision with one arm as a result of practice with the other. Cf. Scripture, Smith, and Brown, *Yale Stud.*, ii. 114. (c) Rate. Cf. Galton, *Rep. Anthropol. Lab.*, 1885; Fullerton and Cattell, *On the Perception of Small Differences* (1892). (d) Force; adjustment of motor discharge to expected resistance. Cf. Müller and Schumann, *Pflüger's Arch.*, xli (1891), 119; Delabarre, *Ueber Bewegungsempfindungen* (1891); Fullerton and Cattell, *loc. cit.*; Delabarre, Logan, and Reed, *Psychol. Rev.*, iv (1897), 615. (e) FATIGUE (q. v.). (f) Passage of voluntary into automatic movement. Cf. Solomons and Stein, *Psychol. Rev.*, iii. 492, and v. 295; the literature given under HABIT and REACTION TIME (effects of practice).

(4) Involuntary movement. (a) Reflexes (knee-jerk, &c.). See REFLEX, and PATELLAR REFLEX. (b) Tremor of hand. See Jastrow, *Amer. J. of Psychol.*, iv, v; Tucker, *ibid.*, viii. (c) Accommodation and convergence. Cf. EYE-MOVEMENTS. (d) Jerking of eyes. Cf. EYE-MOVEMENTS. (e) Motor expression of emotion. Cf. EMOTIONAL EXPRESSION. (H.C.W.)

Mover and Moved (in Aristotle): see MOTION, *passim*, and PRIMUM MOBILE.

Müller, Friedrich Max. (1823-1900.) Born at Dessau, Germany; educated at Leipzig and Berlin Universities. Settled at Oxford in 1848, and became professor of comparative philology in Oxford University in 1868. His fame was principally as a philologist and orientalist, although he wrote also on philosophical and psychological topics.

Müller's Circle: Ger. *Müller'scher Kreis*; Fr. *cercle de Müller*; Ital. *circolo del Müller*. A circle which passes through the fixation point and the optical centres of the two eyes, and which lies in the plane of regard when the eyes are in the primary position of convergence. Cf. HOROPTER. (E.B.T.)

Multiplicity: Ger. *Vielheit, Mannigfaltigkeit*; Fr. *multiplicité*; Ital. *multiplicità*. This term appears in connection with the problem of the One and the Many which so early agitated Greek philosophy. How, that is to say, are we to reconcile the aspect of the world as consisting of an apparently infinite number of separate beings with the unity of existence which philosophic reason de-

MULTITUDE

mands? Cf. ONE (the), and UNITY AND PLURALITY.

The Eleatic philosophy pronounced the appearance of multiplicity to be an illusion of the senses; and Zeno, by a series of indirect arguments, endeavours to demonstrate its impossibility. The same problem (*ἐν τὰ πολλὰ εἶναι καὶ τὸ ἐν πολλὰ*) reappears in Plato, who reduces the multiplicity of sense-phenomena to the unity of the idea in which they participate or which they represent. The multiplicity of the sense-world appears to be regarded here also as a species of illusion. But Plato recognizes a multiplicity within the ideal world itself, in virtue of what has been called the community of concepts (*κοινωνία τῶν γένων*), or the participation of the ideas in one another. This world of ideas thus differs from the abstract unity of the Eleatics in being rather a series of ideas which dialectically imply one another. As he says in the *Philebus* (15 D): 'The One and the Many run about everywhere together, in and out of every word which is uttered, as they have done in all time past as well as present; and this union of them will never cease, and is not now beginning, but is, I believe, an everlasting quality of thought itself, which never grows old in us.'

The same question of the One and the Many is the underlying motive of the scholastic disputes between nominalism and realism, and gives a pantheistic or an individualistic bias to the systems of most philosophers.

In the Kantian philosophy, the contribution of sense to knowledge is spoken of as a mere Manifold (*Mannigfaltiges*), a multiplicity or diversity of particulars. The synthetic function of the understanding must supervene with its categories or connective notions upon these passively apprehended units of sense before we can speak of knowledge or experience.

(A.S.P.P.)

Multitude (in mathematics) [Lat. *multitudo*]: Ger. *Mächtigkeit*, *Cardinalzahl*; Fr. *puissance*; Ital. *moltitudine*. That relative character of a collection which makes it greater than some collections and less than others. A collection, say that of the *A*'s, is greater than another, say that of the *B*'s, if, and only if, it is impossible that there should be any relation *r*, such that every *A* stands in the relation *r* to a *B* to which no other *A* is in the relation *r*.

The precise analysis of the notion is due to G. Cantor, whose definition is, however, a little different in its mode of expression,

since it is more abstract. He defines the character in these words: 'By *Mächtigkeit* or cardinal number of a collection (*Menge*) *M*, we mean the universal concept, which by the help of our active faculty of thought results from the collection *M* by abstraction from the characters of the different members (*Elemente*) of that collection and from the order in which they are given (*Gegebensein*).

A cardinal number, though confounded with multitude by Cantor, is in fact one of a series of vocables the prime purpose of which, quite unlike any other words, is to serve as an instrument in the performance of the experiment of counting; these numbers being pronounced in their order from the beginning, one as each member of the collection is disposed of in the operation of counting. If the operation comes to an end by the exhaustion of the collection, the last cardinal number pronounced is applied adjectivally to the collection, and expresses its multitude, by virtue of the theorem that a collection the counting of which comes to an end, always comes to an end with the pronunciation of the same cardinal number.

If the cardinal numbers are considered abstractedly from their use in counting, simply in themselves, as objects of mathematical reasoning, stripped of all accidents not pertinent to such study, they become indistinguishable from the similarly treated ordinal numbers, and are then usually called *ordinal numbers* by the mathematico-logicians. There is small objection to this; yet it is to be remarked that they are ordinal in different senses in grammar and in the logic of mathematics. For in grammar they are called ordinal as being adapted to express the ordinal places of other things in the series to which those things belong; while in the logic of mathematics the only relevant sense in which they are ordinal is as being defined by a serial order within their own system. The definition of this order is not difficult; but the syntax of ordinary language does not lend itself to the clear expression of such relations in the manner in which they ought to be expressed in order to bring out their logical character. It must, therefore, be here passed by. In fact, none of the doctrines of logic can be satisfactorily expressed under the limitations here imposed, however simple they may be. The doctrine of ordinal numbers is by Dedekind (*Was sind und was sollen die Zahlen?*) made to precede that of the cardinal numbers; and this is logically

preferable, if hardly so imperative as Schröder considers it.

The doctrine of the so-called ordinal numbers is a doctrine of pure mathematics; the doctrine of cardinal numbers, or, rather, of multitude, is a doctrine of mathematics applied to logic. The smallest multitude is most conveniently considered to be zero; but this is a question of definition. A *finite* collection is one of which the syllogism of transposed quantity holds good. Of finite collections, it is true that the whole is greater than any part. It is singular that this is often taken as the type of an axiom, although it has from early times been a matter of familiar knowledge that it is not true of infinite collections. Every addition of one increases a finite multitude. An infinite collection cannot be separated into a lesser collection of parts all smaller than itself.

The multitude of all the different finite multitudes is the smallest infinite multitude. It is called the *denumerational* multitude. (Cantor uses a word equivalent to *denumerable*; but the other form has the advantage of being differentiated from words like *enumerable*, *abnumerable*, which denote classes of multitudes, not, like *denumerational*, a single multitude.) Following upon this is a denumerational series of multitudes called by C. S. Peirce the *first*, *second*, &c. *abnumerable* multitudes. Each is the multitude of possible collections formed from the members of a collection of the next preceding multitude. They seem to be the same multitudes that are denoted by Cantor as *Alephs*. The first of them is the multitude of different limits of possible convergent series of rational fractions, and therefore of all the quantities with which mathematical analysis can deal under the limitations of the doctrine of limits. (The imaginaries do not increase the multitude.) What comes after these is still a matter of dispute, and is perhaps of inferior interest. The transition to continuity is, however, a matter of supreme importance for the theory of scientific method; nor is it a very complicated matter; but it cannot be stated under the limitations of expression here imposed upon us.

(C.S.P., H.B.F.)

Literature: see NUMBER.

Mundane: see MUNDUS.

Mundus [Lat.]: Ger. *Welt*; Fr. *monde*; Ital. *mondo*. The term used by the Romans to render the Greek *κόσμος*, the visible orderly system of the world, with more particular reference to the heavens and the heavenly

bodies, whose regular motions first impressed the idea of order on primitive thought.

Cicero's definition (*Tim.* 10) retains this reference: 'ut hunc hac varietate distinctum bene Graeci κόσμον, nos lucentem mundum nominaremus.' In so far as this system is contrasted with a preceding state of things—whether chaos or primitive elements—the κόσμος or *mundus* is regarded as limited both in time and in space, and is not therefore to be identified with the universe (τὸ πᾶν, *omne*). The Epicurean philosophy in particular supposes innumerable worlds (in some respects perhaps resembling, in many more probably differing from, the world-system we know) to result from the mechanical clashing of the atoms in infinite space throughout infinite time. Each world-system is girdled from the embrace of hungry space by an outer envelope of fire or ether—the 'flammanitia moenia mundi' of Lucretius' account. In the 'inter-mundia' or intermundane spaces Epicurus supposed the gods to reside. Cf. Lucretius, *De rerum Natura*, iii. 16–22, finely rendered by Tennyson in his poem *Lucretius*.

The terms *mundus sensibilis* and *mundus intelligibilis* were used to express the Platonic contrast between the world of sense-perception, which is a world of phenomena or mere appearance, and the ideal world, the world of noumena or of ultimate reality. They were appropriated by Kant, in a somewhat altered sense, to denote the world of nature or of categorized sensation, to which he limits our knowledge; and the intelligible world (*Verstandeswelt*), which is for the theoretic reason a merely negative or limitative conception, but which the practical reason reveals as a realm of ethical ends and moral freedom. It is in connection with this Kantian distinction that the term mostly occurs in modern philosophical writing.

(A.S.P.P.)

Mundane and extra-mundane are used respectively for what is and what is not subject to the conditions of the physical world. (H.R.S.)

Muscae Volitantes [Lat. *musca*, a fly, + *volitans*, dancing]: Ger. *fliegende Mücken*; Fr. *mouches volantes*; Ital. *mosche volanti*. Variable entoptic appearances, due to the presence of small foreign bodies in the vitreous humour. They take the form of bright worm-like threads, strings of glistening beads, groups of bright dots, tiny circles with brighter centres, &c., and usually travel downward in the field of vision (i. e. upward in the humour). Cf. ENTOPTIC PHENOMENA.

MUSCLE

(2nd ed.), 188; SANFORD, Course in Exper. Psychol., expt. 110. (E.B.T.)

Muscle [Lat. *musculus*, little mouse, dim. of *mus*, Gr. *μῦς*]: Ger. *Muskel*; Fr. *muscle*; Ital. *muscolo*. The active movements of animals are accomplished by means of a specially differentiated contractile tissue called muscle.

Contractility is a general property of living organisms manifested in amoeboid, ciliary, or muscular movements. Even in the unicellular Protozoa, certain portions of the cell-substance become specialized as contractile fibrils for executing movements, and in the lower Metazoa, such as the Coelentera (Polyps and Jelly-fish), cells of the outer and of the inner epithelium may develop special contractile basal processes. The muscular movements of the Coelomata are accomplished by means of special muscle-cells, or cross-striated muscle-fibres, developed from the mesodermal layer of the EMBRYO (q.v.). Muscle-cells chiefly are found in Worms, Molluscs, and Echinoderms; striated muscle-fibres in Arthropods. In the higher vertebrates, such as man, the 'smooth' muscle-cells are found in the walls of the intestine and other viscera, and of the blood-vessels. Their contraction is not under the direct control of the will, hence they are frequently called the involuntary muscular tissue. These muscles are formed of elongated cells pointed at both ends, consisting chiefly of longitudinally striated contractile substance, enclosed in a delicate sheath, and provided with an oval nucleus. The muscles of the heart are composed of peculiar fibres made of rows of flattened, more or less branched, cells exhibiting transverse striations. The voluntary or skeletal muscles, the contraction of which is under the direct control of the will, constitute by far the greater part of the muscular or fleshy portions of the body, and consist of cross-striated fibres.

The fibres are formed of a thin sheath (sarcolemma) enclosing the elongated, more or less cylindrical, soft muscular substance provided with numerous oval nuclei at its periphery. Under the microscope the muscular substance exhibits fine longitudinal and coarse transverse striations. The former seem to be due to the fact that each fibre is formed of a bundle of fine parallel fibrils (sarcostyles); whilst the cross striae are due to the alternation of narrow light with broader and more opaque regions. The denser and firmer substance of the sarcostyles appears to be the more actively contractile element, embedded in the more fluid substance (sarcoplasm) accumulated in the

region of the light-zones. Contraction of the fibre is brought about by the shortening and swelling of the row of segments of the sarcostyles occupying the dark zones. Waves of contraction may pass along the fibre.

Muscles are formed of bundles of such fibres bound together in connective tissue and extending from one point of attachment to another. Movement of the parts is brought about by a drawing together of the points of attachment when the muscle contracts, portions of the bony skeleton often serving as levers.

The energy required for the muscular contractions is derived partly from carbohydrates, such as glycogen, stored in the muscle itself or brought to it by the blood, and probably also from fats.

Living muscle is very elastic and extensible. During contraction it shortens and becomes correspondingly thicker. On relaxation it reverts to its original shape by virtue of its elasticity. Normally, a muscle contracts on receiving a stimulus through its motor nerve; but it may be made to contract by the application of suitable mechanical, electrical, thermal, or chemical stimuli, either directly or indirectly by means of its nerve. A single stimulus causes a single 'twitch' of the muscle; the contraction is preceded by a very short 'latent period,' and is followed by a longer period of relaxation. On repeating the stimulus, the contractions at first slightly increase in strength, then begin to decrease, and steadily diminish, until finally the muscle reacts no more. This muscular 'fatigue' is due probably both to the accumulation of waste products and to the exhaustion of the materials which afford the source of energy. Within certain limits, the contraction of a muscle is proportional to the strength of the stimulus, being nil with less than minimal stimulus, and constant after the stimulus has reached its maximal intensity. A repetition of stimuli following each other so rapidly that the muscle has no time to relax, leads to the condition known as 'tetanus,' in which the muscle remains in a state of contraction until the stimuli cease or it is exhausted. Persistent voluntary contractions are considered by some physiologists to be of the nature of a tetanus.

Literature: E. A. SCHÄFER, Essentials of Histology, also in Quain's Anat. (10th ed.); textbooks of physiology, e.g. FOSTER'S, WALLER'S, 'American,' &c. For a full table of the human muscles, with figures, see GOULD, Illus. Dict. of Med., sub verbo. (E.S.G.)

Muscle Reading: Ger. *Muskellesen*, *Gedankenlesen* (thought reading); Fr. *lecture de la pensée* (thought reading); Ital. *lettura del pensiero* (thought reading). The interpretation through contact, such as grasping the hand, of slight involuntary movements or muscular contractions, and the detection thereby of the direction or object of another's thoughts.

The basis of muscle reading rests upon the tendency—a marked one in some individuals, and less so in others—of involuntary movements and impulses to motor expression to accompany mental operations. Such movements find most ready expression in the contraction of delicate and specialized muscle groups, of which the hand is a familiar example. Such involuntary movements, particularly of the hand, were offered in explanation of the phenomena of spiritualism, such as the rappings, table turning, and planchette writing. The phenomena of the divining rod have also been referred to involuntary movements (see letter of Chevreul, 1852, in Binet, *Alterations of Personality*, Eng. trans., 221). The experimental demonstration of these movements has been frequently made. For such purpose an apparatus is necessary by which the movements may be rendered visible. Such apparatus have been devised by Jastrow (*Fact and Fable in Psychol.*, 130) and Sommer (*Zeitsch. f. Psychol.*, xvi. 275). See Automatonograph, under LABORATORY AND APPARATUS, II, B, (c), (5).

In this way it has been proved that the thought of a particular corner of the room is likely involuntarily to direct the hand towards that corner, the direction of the attention towards a sound is apt to start a movement towards the locality of the sound, and so on. In brief, the local direction of the attention is more or less readily reflected in the accompanying involuntary movement. More recently it has been shown that involuntary whispering may also occur; and the movements of the larynx accompanying reading to oneself, the active thinking of certain sounds, &c., have been recorded. While the mere fact of movement not infrequently rises into consciousness, the directions and details of the movements remain unconscious and wholly involuntary. When, in susceptible persons, these movements become pronounced and directive, they develop into AUTOMATIC WRITING (q. v.), planchette writing, &c. Ordinarily the movements fundamental to muscle reading involve only direction and local indication; but truly 'automatic' move-

ments convey by symbols, such as writing, an indication of the content of the mover's thoughts.

Muscle reading as an expert performance has been exhibited by various performers from about 1874; it is often misleadingly termed mind reading and heralded as dependent upon a mysterious power to divine another's thoughts. The usual procedure is for the muscle reader to place the hand of his subject against his own forehead, and by noting the indications of the movements and of their direction and the moments of increased excitement, to find a hidden object, to select from a group of numbers the digits which compose the number of a bank-note of which the subject is thinking, and other more elaborate variations of such procedures. The skill with which such involuntary indications can be interpreted by an expert muscle reader—combined with a more general shrewdness and alertness—is remarkable, and many striking feats have been recorded. It may be stated as probable that, apart from general shrewdness, such performances (feats involving collusion or fraud are not considered in this connection) involve nothing more than the skilful interpretations of involuntary muscular contractions; but with this must be included not only definite movements, but exhibition of excitement (change of respiration, flushing, the hush of the audience when the muscle reader approaches the hiding-place, &c.), and all the various accompaniments of intense concentration. The process on the part of the muscle reader requires an extreme and wearing concentration, and some performers are only dimly conscious of their *modus operandi*. The difference in the readiness with which various subjects become helpful to a muscle reader is very great; but nothing more than general correlations of such motor tendencies with other nervous dispositions may be postulated.

We may name Cumberland, Bishop, Brown, Onofroff, Capper, Pikman, Dalton, Caselli, and others as expert performers.

Literature (on involuntary movements): JASTROW, *Amer. J. of Psychol.*, iv. (1892) 398 ff., v. (1892) 223 ff.; PREYER, *Die Erklärung des Gedankenlesens* (1886); HANSEN and LEHMANN, *Ueber unwillkürliches Flüstern*, *Philos. Stud.*, xi. (1895) 471-530; CURTIS, *Automatic Movements of Larynx*, *Amer. J. of Psychol.*, xi. (1900) 237-40. On muscle-reading performances: articles on Muscle Reading, Mind Reading, or Thought

Reading, in *Nineteenth Cent.*, xx. 867; *Forum*, xi. 192; *Pop. Sci. Mo.*, x. 459, xxi. 634 (Beard); *Annual Encyc.* (1887), 506. (J.J.)

On 'Pikmanism' or 'Cumberlandism' see articles by MORSELLI, TAMBURINI, GUICCIARDI, and FERRARI, in *Riv. Sperim. di Freniat.* (1891-9). See also OTTOLENGHI, *La Suggerione e la Facoltà psichiche occulte* (1900), 95-139; BEARD, *The Study of Trance, Muscle Reading, &c.* (New York, 1882); TARCHANOFF, *Gedankenlesen* (1895). (E.M.)

Muscle-sense and Muscle-sense Illusions: see MUSCULAR SENSATION, and ILLUSIONS OF MOTION AND MOVEMENT, II.

Muscular (or **Muscle**) **Sensation:** Ger. *Muskelempfindung*; Fr. *sensation musculaire*; Ital. *sensazione muscolare*. The phrase is used, loosely and vaguely, for (1) the complex of sensations arising from skin, joint, muscle, and tendon in such perceptions as those of resistance, of movement, and of lifted weight. It is thus the equivalent of Bastian's KINAESTHETIC SENSATION (q.v.); and for (2) a sensation of dull and diffused character obtained (after elimination of other sense-qualities) by stimulation of a striped muscle; localized, like articular sensation, within the stimulated limb. (E.B.T.-J.M.B.)

(3) A sensation of muscular fatigue which follows long-continued stimulation of a muscle, either voluntary (indirect) or non-voluntary (direct: electrical, chemical, &c.).

It is probable that muscular fatigue is a congeries of mixed qualities of the preceding sorts, (1) and (2). The question of its central or peripheral seat is now about settled in favour of the kinaesthetic view. Mosso and Waller have shown that intellectual work induces muscular fatigue. (J.M.B.)

Literature: The recognition of a distinct muscle sense appears to go back to ARISTOTLE (*Hist. An.*, i. 4; *De Part. An.*, ii. 1, 10; *De Anima*, ii. 11). It certainly goes back to SCALIGER (*De Subtil.*, 1557). Cf. HAMILTON, ed. of Reid (1880), 867. The modern doctrine of the muscle sense may be said to begin with Sir CH. BELL. An excellent résumé to 1898 is by HENRI (*Année Psychol.*, v. 1899), who (cf. also JOTYKO, *ibid.*, on muscular fatigue) traces the subject back to Descartes. Henri gives a bibliography of 391 titles. Music [Gr. *μουσική*]: Ger. *Musik*; Fr. *musique*; Ital. *musica*. The fine art which employs tones produced in rhythmic succession.

Making rhythm the essential to music, complex effects are produced by added factors, notably melody, in which the succession is marked by recurring similarities, and HARMONY (q.v.), in which complex simultaneous tone effects are employed.

The problems connected with music are principally the following. (1) The essential factor or factors. (2) The enhancing of the musical effect by the additional factors: how and why harmony, for example, is combined with melody in a musical whole. (3) The origin of music and its development as a fine art. (4) The relation of music to the other arts in general aesthetic theory (cf. ART AND ART THEORIES, and CLASSIFICATION of the fine arts). (5) The nature of musical enjoyment; its emotional and other psychological elements.

The origin of music has been found by some in association with the early dance, the latter being held to have supplied the element of rhythm to which rude instruments beat the accompaniment. Others connect music with spontaneous cries, particularly those of the mating season. The song of birds is the best illustration of the employment of successive notes for the purposes of instinctive expression.

As to the 'meaning' or 'expression' conveyed by music, the two current views are widely apart. Some hold—and possibly the best psychological opinion is with this view—that the musical effect is purely a sensuous one; when, however, the sensuous ingredients of higher emotional and sentimental states are aroused through this connection, the music itself is considered to express or 'mean' the emotion or sentiment. General moods and dispositions are, no doubt, ministered to by music, through differences of rhythm, &c., and so come to be expressive to the hearer, of what he already finds in himself. The other theory—held principally by musicians, who are certainly entitled to an opinion—maintains that music is expressive of emotions and thoughts; indeed, that a musical composition is analogous to a drama in the unfolding and

presentation of a theme or narrative. The views of musicians, however, are generally mystical and obscure.

Literature: SPENCER, *Princ. of Sociol.*; WALLASCHKE, *The Origin of Music*; HIRN, *The Origins of Art*; works on HARMONY (q. v.). Also HELMHOLTZ, *Sensations of Tone* (Eng. trans.); GROVE, *Dict. of Music*; GURNEY, *The Power of Sound*; the literature of Wagner and Wagnerism. (J.M.B.)

Musical Tone: Ger. *Ton*, *Klang*; Fr. *son*; Ital. *suono* (or *tono*) *musicale*. See TONE (and CLANG), and COMPOUND TONE.

Mutation (in biology) [Lat. *mutare*, to change]: Ger. *Mutation*; Fr. *mutation*; Ital. *mutazione*. A term introduced by W. Waagen to denote the hypothesis that the causes of modification lie deep in the specific nature and affect uniformly large numbers of individuals simultaneously. Cf. VARIATION.

The essence of this idea, like many another rechristened at a later date, passed through the mind of Darwin, was weighed and found wanting. Thus, long before natural selection had presented itself to him, he wrote of the causes of extermination acting from within the specific nature and leading to the simultaneous dying-out of the whole of the individuals of a species spread over, perhaps, a vast tract of country. He also thought of such species as compelled by their constitution to change into other species or else to die out. W. B. Scott has argued that the evidence of paleontology is consistent with 'that steady advance along certain definite lines which Waagen called mutation,' while he considers it inconsistent alike with (1) the 'discontinuous evolution' of W. Bateson, or 'transilience' of F. Galton, depending on the occurrence of large variations, and with (2) the accumulation of minute individual differences by natural selection. The former criticism is undoubtedly well aimed. Bateson's statement is an account of what he believes has happened rather than a theory of causes. Paleontology is an account of what has happened; and whenever it yields a complete account, the history is continuous and not discontinuous. On the other hand, the record of paleontology is exactly what the natural-selectionist would expect. W. B. Scott indeed says, 'The direct, unswerving way in which development proceeds, however slowly, is not suggestive of many trials, and failures in all directions save one.' The contemplation of a series of pigeons' skeletons, from the most modern product of artificial selection right back to the ancestral

rock dove, would lead this distinguished paleontologist to similar conclusions, did he not in this case know the history and the creative part selection has played. The phenomena mutation has been invoked to explain are precisely the phenomena we should expect to appear if evolution has been the product of the action of natural selection upon minute individual differences. The upshot of the struggle for existence as we see it waged to-day, with its 'many trials' and 'failures in all directions save one,' the one which leads to the survival of a minute fraction of each generation, could, with our present knowledge, but rarely be inferred from a study of the skeletons of the individuals concerned. How much less should we be justified in expecting to reconstruct the details of its operation by a careful study of the skeleton of forms, of which in the living state nothing directly is known? But while we cannot expect, as yet, to recover these details, the general trend of evolution is exactly what the selectionist would anticipate, exactly what is unexplained by any other theory than natural selection; viz. an advance along a line of ever more perfect adaptation to their past environments, so far as their main features can be reconstructed. (E.B.P.)

The theory of mutation seems to have received some support from a research of de Vries published since the above paragraphs were written, although it is too early to judge as to its permanent value. The following passage is quoted from an article signed J. P. K. in *Nature*, June 27, 1901:—

'De Vries has just published the first part of a book entitled "*Die Mutationstheorie*. Erster Band. Versuche und Beobachtungen über die Entstehung von Arten im Pflanzenreich" (Leipzig: Veit, 1901), containing, as the title indicates, the account of a series of observations on the formation of new species in plants. Starting from the fact, well known to florists, of the appearance of "single variations" in their flower-beds, de Vries has been trying to find wild flowers which would show the same phenomenon. Of the 100 species investigated only one appeared to possess the property which was looked for, the *Oenothera Lamarckiana*, originally from America, but at present growing wild in Holland. Now about ten years ago de Vries transferred specimens of this plant to the botanical gardens at Amsterdam, and up to date he has studied as many as 50,000 of its descendants.

'Of these 50,000 about 49,200 were in no respect different from the original patriarchal *O. Lamarckiana*, showing no tendency towards gradual change in any special direction, but only the common small fluctuating "variations" as regards size and appearance on either side of a normal, in fact resembling in that respect other plants and animals which are left to themselves without being interfered with.

'Quite otherwise the 800 other plants. None of these, although appearing spontaneously, could be said to be representatives of the species *Lamarckiana*, from which they were descended. De Vries arranges them in seven distinct species, viz. 1 of *O. gigas*, 56 of *O. albida*, 350 of *O. oblonga*, 32 of *O. rubrinervis*, 158 of *O. nanella*, 221 of *O. lata*, and 8 of *O. scintillans*. Now comes the crucial question of the whole investigation. What right has de Vries to look upon the differences between these seven species and the original species as being of a different order from the variations between the specimens of each species, and what entitles him to call these differences *mutations* as opposed to variations? The answer is this: a representative of these new species produces descendants the majority of which unmistakably belong to the same species as itself. Not all the new species behave in the same way; as an instance, the only representative of *O. gigas* was isolated and made to fertilize itself. From it were obtained 450 plants, all of which, with only one exception, were *O. gigas*, the one exception not being a return to *Lamarckiana* but belonging to a new variety. The plant is a strong one and retains its properties in subsequent generations so far as investigated.

'The *O. albida*, on the other hand, which appeared frequently, is a weak plant, not very fertile, but perfectly constant so far as it went. The last species in the above list, the *O. scintillans*, differs from the others in this respect, that it is extremely unstable, i.e. possesses the property of mutation to a high degree, a large proportion of its descendants belonging to other species, specially *O. oblonga* and *Lamarckiana* itself.

'Enough has been said to show that de Vries has evidently made a momentous discovery. So far as his observations go, new species appear suddenly by mutation, never as the outcome of a progressive variation. . . . As we saw, some of the new species which made their appearance did not seem to be inferior

in stability to the mother-species; on the other hand, one of the species, the *O. lata*, only appeared as female plants without pollen, and the *O. albida* did not show the same vitality as the others and was evidently doomed to disappear again. The observations, therefore, do not support the idea that in the formation of new species Nature is carrying out a definite plan; on the contrary, it all looks like accident. A new species may be one strong and fertile enough to remain, and possibly, under favourable conditions, replace the mother-species, but it may just as well be a sickly kind without any chance in the struggle for existence. For the struggle for life between individuals de Vries substitutes the struggle for continued existence between species, the new species always appearing suddenly.

'De Vries' views are thus directly opposed to the common form of the theory of evolution; not that the importance of the single variations had escaped attention altogether, but they were always lost sight of, and prime importance is generally attached to the selection through the ordinary variations. De Vries' experiments support the results arrived at by Scott and other paleontologists that there is no evidence in the successive strata of the earth of a gradual development of one species into another and that everything points at small but sudden transitions.' (J.M.B.)

Literature: W. WAAGEN, Die Formenreiche des Ammonites subradiatus, in Be-necke's Geognost.-Palaeontol. Beitr., ii. 179-256; W. B. SCOTT, On Variations and Mutations, in Amer. J. of Sci. (1894), xlviii. 355; W. BATESON, Materials for the Study of Variation (London, 1894); Life and Letters of Charles Darwin (London, 1887); CONN, The Method of Evolution; BAILEY, and DE VRIES (as cited above). (E.B.P.-J.M.B.)

Mutism [Lat. *mutus*, dumb]: Ger. *Mutismus*; Fr. *mutisme*; Ital. *mutismo*. The lack of development or the functional inhibition of the faculty of speech. It is contrasted with aphasia, which is defect or organic disturbance of speech. Cf. SPEECH AND ITS DEFECTS. (J.M.B.)

The most frequent form of mutism, which may be partial or complete, is that arising from congenital or early deafness. See DEAF-MUTISM. Mutism may also be the result of serious mental defect or disorder (idiocy), of mental stupor, of a delusional insanity in which the patient for some insane reason refuses to speak. Hysterical mutism, like

hysterical aphonia, is of that special type peculiar to hysterical disturbances. See HYSTERIA. Mutism of an allied nature is also symptomatic of the disease KATATONIA (q. v.). (J.J.)

Mutuality [Lat. *mutuus*, from *mutare*, to change]: Ger. *Gegenseitigkeit*; Fr. *mutualité*, *échange mutuel*; Ital. *mutuazione*. Double relation of give and take, in which the two relations are identical. (J.M.B.)

Myelitis (chiefly in combination) [Gr. *μυελός*, marrow]: Ger. *Rückenmarksentzündung*, *Myelitis*; Fr. *myélite*; Ital. *mielite*. A diseased condition of the spinal cord.

Leucomyelitis is a diseased condition of the white or fibrous matter of the cord. Primary lesions of the white column consist in destruction of the nerve fibres and simultaneous increase of the neuroglia. The medullary sheaths are the first to be affected. Granular corpuscles collect in the lymph-spaces about the blood-vessels. The so-called crossed pyramidal tracts are most frequently affected with sclerosis. Secondary degenerations in the cord also result from injuries to the motor areas of the cortex and the basal centres. Cf. DEGENERATION. Poliomyelitis, or degenerative atrophy of the anterior cornea, occurs as 'infantile paralysis' and 'chronic anterior poliomyelitis' in adults. The last named is very obscure. (H.H.)

Myo- (in compounds) [Gr. *μῦς*, muscle]: the same in other languages. Muscle (in compounds or expressions); as myograph, an instrument for recording the contraction of a muscle. (J.M.B.)

Myograph: see MYO-, and LABORATORY AND APPARATUS, III, A.

Myopia [Gr. *μύειν*, to close, + *ὤψ*, the eye]: Ger. *Kurzsichtigkeit*; Fr. *myopie*; Ital. *miopia*. Near-sightedness; short-sightedness, hypometropia, brachymetropia; the condition of an eye in which, with relaxed accommodation, parallel rays of light are brought to a focus before they reach the retina.

Its most frequent cause is an abnormal elongation of the antero-posterior axis of the eye-ball, and it may then be termed axial; it may also be due to excessive convexity of the refracting media (myopia of curvature) or to an excessive index or amount of refraction of the dioptric constants (index myopia). In myopia the rays of light are dispersed on the retina, and the confused images which thus result must be corrected by the use of concave lenses of suitable strength. The statistics and causes of myopia furnish an important topic in discussion of the hygiene of vision in the

school-room and elsewhere. The opposite of myopia is HYPERMETROPIA (q. v.); both are forms of Ametropia as opposed to Emmetropia. See also VISION (defects of), and PRESBYOPIA.

Literature: J. S. WELLS, *Dis. of the Eye* (Amer. ed., 1883), 629; NORRIS and OLIVER, *Syst. Dis. of the Eye*. (J.J.)

Mysteries [Gr. *μυστήριον*, secret doctrine or rite]: Ger. *Mysterien*; Fr. *mystères*; Ital. *misteri*. Those rites of the ancient Greek religions which were concealed from the view of the public and practised only by persons who had been solemnly initiated and set apart for that service.

In Christian theology, hidden truths that have been brought to light through divine revelation; or the Sacraments of the Church, particularly the Eucharist. (A.T.O.)

Mysticism [Gr. *μυστικός*, belonging to secret rites]: Ger. *Mystik*, *Mysticismus*; Fr. *mystique*, *mysticisme*; Ital. *misticismo*. Those forms of speculative and religious thought which profess to attain an immediate apprehension of the divine essence or the ultimate ground of existence.

Mysticism springs most frequently from the religious desire for an intimate communion with God, when this is allied with a temperament of speculative boldness. But whereas ordinary religion realizes such communion in the life of ethical endeavour and aspiration, the practical element in religion is overmastered in the mystic by the metaphysical. Penetrated by the thought of the ultimate unity of all existence, and impatient of even a seeming separation from the creative source of things, mysticism succumbs to a species of metaphysical fascination. Its ideal becomes that of passive contemplation, in which the distinctions of individuality disappear, and the finite spirit achieves, as it were, utter union or identity with the Being of beings. As this goal cannot be reached under the conditions of relation and distinction which ordinary human thought imposes, mysticism asserts the existence of a suprarational experience in which this union is realized. Such is the intuition or ecstasy or mystical swoon of the Eastern mystics, the mystical or metaphysical love (*ἔρως*) of the Neo-Platonists, and 'gifts' of the mediæval saints. Bonaventura speaks of the 'apex mentis' or 'scintilla,' and Meister Eckhart of the 'Fünklein' or spark, as the faculty by which the mystical union is attained. In a more purely speculative form,

a similar appeal to a 'higher' faculty or mode of apprehension is made by Schelling in his theory of intellectual intuition; and Schopenhauer describes in similar terms the vision of the Platonic ideas in which he conceives the mind to achieve its emancipation from the evils of finitude and the sway of the irrational will. In both these cases, however, the inspiration is drawn from the aesthetic rather than the religious sphere.

The element of truth in mysticism is its keen realization of the metaphysical unity of existence, and, in particular, of the intimacy of the relation between the finite spirit and the infinite. Intense religious feeling tends to be tinged with mysticism; and historically, both in philosophy and in religion, mysticism frequently appears as a protest against mechanical, external, or anthropomorphic fashions of representing the divine and its relations to man and the world. But in its impatience of separation it overleaps the conditions of thought altogether, and in its reaction against anthropomorphism it neglects the element of relativity which must enter into all human conceptions of the absolute. A union so immediate that the distinction of subject and object disappears involves the suppression or absorption of the conscious person; the mystics themselves describe 'the ecstasy' in terms which leave it indistinguishable from a lapse into unconsciousness. Mysticism becomes, in fact, the victim of sensuous metaphor applied to supersensuous or spiritual experience, and treats the relation of ethical harmony and dependence between the divine and the human spirit as if it were one of chemical fusion or interpenetration of substances. Moreover, in its attempt to transcend the bounds of reason and to exalt the divine above all anthropomorphic predicates, mysticism leaves us, as in Neo-Platonism, with the empty abstraction of the nameless and supra-essential One—the One which transcends both knowledge and existence (*ἐπέκεινα τῆς οὐσίας*). We reach a truer and more adequate account of the absolute when, with a justifiable and inevitable anthropomorphism, we interpret its nature according to the highest categories of our own experience. As Cousin has well said: 'The true union of the soul with God takes place through virtue and truth. Every other union is a chimera, a peril, sometimes a crime. It is not permitted to man to abdicate under any pretext what makes him man and renders him capable of understanding God and expressing in him-

self an imperfect image of him, that is to say, reason, will, consciousness.'

Mysticism is sometimes used, by writers of an empirical or positivistic bias, as a dyslogistic term or opprobrious epithet, and is apparently extended to cover any system of so-called 'transcendental' philosophy, which accepts other data than sensation and association. So it appears to be used by Mill (*Logic*, Bk. V. chap. iii. § 4), where he introduces it under the head of 'a *priori* fallacy or natural prejudice.' In a somewhat similar sense, but with an intention to commend, it is applied by a writer like Carlyle to any philosophy which does not limit itself to the world of 'the visible' and 'our logical mensurative faculty' (cf. the *Essay on the State of German Literature*, and *Sartor Resartus*, iii. 3). Such a usage is, however, quite inexact.

In defining mysticism some reference has already been made to its historical appearances. In India the Brahmanic pantheism has always lent itself to a mystical asceticism. In Western thought mysticism appeared in the Orphic-Pythagorean sects (cf. Rohde, *Psyche*). The theosophical speculation of Plotinus and other Neo-Platonists—foreshadowed in the so-called Neo-Pythagoreans, and, to some extent, in the contemplative asceticism of the Essenes and in Philo Judaeus—culminates in the idea of mystical union with the utterly transcendent One. Ecstasy, coalescence, contact (*ἔκστασις, ἀπλῶσις, ἀφή*) are some of the terms used by Plotinus to describe this union (*Enneads*, vi. 9. 8–9). The speculative mysticism of Neo-Platonism was transfused into Christian thought through the literary forgeries of the Pseudo-Dionysius. Dionysius was translated into Latin by Scotus Erigena, who adopts his 'negative theology' and the idea of God as exalted above all predicates, and therefore, 'on account of his pre-eminence, not improperly called Nothing.' Religious mysticism first appears in the mediaeval Church in Bernard of Clairvaux, as a protest against the dialectical spirit of Abelard. It was cultivated by the Victorines and also by various heretical sects. The greatest of the mediaeval mystics was Meister Eckhart, among whose followers are reckoned Heinrich Suso, Johann Tauler, and the anonymous author of the *Deutsche Theologie*. The mysticism of Ruysbroeck in the Netherlands was less speculative in character. Nicolaus of Cusa teaches a species of intellectual intuition which he describes as 'comprehensio incomprehensibilis.' Boehme's system of theosophy

is one of the chief monuments of mystical thought. In the field of modern philosophy, mysticism is represented in the 17th century by the Cambridge Platonists, especially Henry More. Some of the phases of Schelling's thought are strongly tinged with mysticism; and thinkers like Novalis, Carlyle, and Emerson, whose philosophical tenets are reached by vivid insight rather than by 'the labour of the notion,' often exhibit a mystical tendency. Swedenborg, on the other hand, though treated by Emerson in his *Representative Men* as the typical mystic, has few of the traits of speculative and religious mysticism, strictly understood. (A.S.P.P.)

The word is used also in recent discussion for the pursuit of the occult, in psychical appearances, spiritualism, and the various forms of magic. The spread of irreligious views, i.e. the decline of the recognition of the supernatural, properly characterized as religious, induces various mystical substitutes for it. Höfding (*Hist. of Mod. Philos.*, Eng. trans., ii. 328 ff.) cites the mysticism of Comte; Guyau (*Non-religion of the Future*) dwells upon the 'recrudescence of faith'; Renan sublimates religion in a form of poetic mysticism; the rise of various 'isms' and 'ologies,' such as 'Christian Science,' 'metaphysical healing,' &c., especially in 'free-thought' communities, bears witness to the vitality of a broadly-defined mystic consciousness (cf. Münsterberg, *Psychol. and Life*, 'Mysticism'). (J.M.B.)

Literature: besides the numerous accounts of NEO-PLATONISM (q.v.), reference may be made to NOACK, *Die christl. Mystik des Mittelalters*; PREYER, *Gesch. d. deutschen Mystik*; COUSIN, *Hist. de la Philos. moderne*, tom. ii, leçon 9. III. chap. ix. (A.S.P.P.-E.M.)

Myth [Gr. *μῦθος*, word, legend]: Ger. *Mythe*; Fr. *mythe*; Ital. *mito*. A story, the spontaneous product of a primitive unreflecting and uncritical consciousness, in which the forces of nature or other agents are represented in personal or quasi-personal forms, and as performing supernatural or superhuman actions.

A myth is to be distinguished from a legend whose subject is, as a rule, some human being rather than a force of nature. It differs from a fable or parable in being direct and spontaneous, having in it no element of reflection

or external design. In an abusive sense the term has become a synonym for pure fiction, although the author of a myth is not conscious of producing a fictitious representation.

Literature: see MYTHOLOGY. (A.T.O.)

Mythical Theory: Ger. *Mythentheorie*; Fr. *théorie mythique*; Ital. *teoria mitologica*. The special designation of the method of Strauss and his followers in explaining the supernatural elements in the story of Jesus as myths or products of the mytho-poetic faculty.

Strauss, in his *Leben Jesu*, starts by recognizing the fact of the human life of Jesus. The supernatural elements arose, he maintains, out of the expectation among the Jews that their Messiah would perform miracles and supernatural actions. Out of this the supernatural elements spontaneously originated in the imagination of the disciples. Strauss maintains that while these myths are fictitious as elements of the historic life of Jesus, they nevertheless represent abstract truths regarding humanity as a whole.

Literature: D. STRAUSS, *Leben Jesu* (1833); P. SCHAFF, *The Person of Christ* (1883); G. P. FISHER, *Essays on the Supernatural Origin of Christianity* (1866). (A.T.O.)

Mythology [Gr. *μυθολογία*]: Ger. *Mythologie*; Fr. *mythologie*; Ital. *mitologia*. Either the body of myths which embody the primitive religious conceptions of a people or race, or the investigation of mythic materials, in order to reduce them to scientific form.

The first reflective treatment of the myth arose among the early Greek thinkers as an effort to develop from it a more rational explanation of the world. This attempt was the parent of both science and philosophy. It was only in modern times and in the present century that the science of mythology originated in a comparative study of the myths of all nations. The most important recent controversy that has developed in this field is that between the philologists led by Max Müller and certain anthropologists whose champion is Andrew Lang, on the issue raised by Max Müller's claim that mythology is a disease of language.

SPENCER, *Princ. of Sociol.*; SAUSSURE, *Lehrb. d. Religionsgesch.* (Freiburg, 1887-9); VIGNOLI, *Myth and Science* (Eng. trans., 1882).

N

NAÏVE — NAME

Naïve [Lat. *nativus*, native, natural]: Ger. *naiv*; Fr. *naïf*, *naïve*; Ital. *semplice*, *ingenuo*. Unreflective, unaffected; the naïve is 'a child-like ingenuousness which is encountered where it is not expected' (Schiller).

Applied in a specifically aesthetic use by Schiller to ancient poetry in contrast with the more reflective modern poetry. This latter he styles 'sentimental,' as making direct appeal to feeling and setting forth conspicuously the feelings of the poet himself. 'The ancients felt naturally; we feel what is natural' (i.e. feel our separation from the natural and make the natural the conscious object of sentiment).

Literature: SCHILLER, On Naïve and Sentimental Poetry, in *Essays Aesthetical and Philosophical*. (J.H.T.)

Naïve Realism: see NATURAL REALISM.

Name [AS. *nama*]: Ger. *Name*; Fr. *nom*; Ital. *nome*. A verbal symbol applied to an object.

The function of naming seems, apart from its use for social communication by means of language, to have the utility of affording a system of symbols which abbreviate and sum up experience, and so serve, in Bacon's phrase, as 'counters of the mind.' See NAME (in logic), and SYMBOLIC FUNCTION; and cf. LANGUAGE FUNCTION. (J.M.B., G.F.S.)

Name (in logic). Two quite different sorts of terms are called in logic names. A *proper name* serves to call to mind an individual object of experience well known both to the speaker and hearer (for if the object is not known to the hearer it is only just beginning to fulfil for him the function of a proper name), and to show that it is that object concerning which information is fur-

nished or desired. Many proper names are names of collective individuals; and a few are grammatically plural, as the Gracchi. A common name, usually now called a *class-name* in logic, though common name is better, has a *signification* as well as a denotation. That is to say, it conveys the idea that whatever it may be that is spoken of, it is of a certain indicated general description, which may be in some sense negative.

Abstract names are common names of fictitious objects which correspond to predicates. At first sight they appear to be mere convenient superfluities; for to say that opium has a soporific virtue, is precisely the same thing as to say that opium puts people to sleep. But closer examination shows that abstract words enable us to express relations which could not otherwise be expressed. A relation is something true of a set of objects. But abstractions enable us to express a fact true of a set of *sets of objects*. Every collective name is an abstract name; and it would be a want of discrimination to say that numbers are superfluities. Moreover, when we see what the true nature of abstract names is, we must confess that their objects may be just as real as the objects of concrete names. They are fictitious only in the sense of having been made up out of concrete names. An abstract name may be regarded as the name of a fictitious individual; and when this individual is perfectly indescribable, like the quality of a simple sensation, the abstract name may perhaps be more like a proper name than like a common name.

Names are divided into names of first imposition and names of second imposition, which latter are names applicable to words, as

pronoun, conjunction, &c. The precise definition is given by Ockham, *Logica*, Pars I, cap. xi. Names are also divided into names of first and of second intention. See TERM. (C.S.P.)

Narcosis [Gr. *νάρκωσις*, a benumbing]: Ger. *Betäubung*, *Narkose*; Fr. *narcose*; Ital. *narcosi*. Lessening or complete deadening of sensibility to pain by means of a narcotic agent, as opium, morphine, chloral hydrate. See NARCOTICS. (C.F.H.)

Narcotics [Gr. *ναρκωτικός*, making stiff or numb]: Ger. *Narkotika*; Fr. *narcotiques*; Ital. *narcotici*. A substance which induces sleep and in large doses insensibility and stupor.

The tendency is to use the term narcotics to include all substances having a marked influence on the nervous system, thus including the sedatives, the hypnotics or soporifics, those which, like curari, produce immobility by paralysing the nerve-endings, and such substances as strychnine, digitalis, &c. Narcotic in the more special sense refers to an intense hypnotic. Among narcotics, sometimes termed direct narcotics, may be mentioned opium, morphine, cannabis indica. Cf. PSYCHIC EFFECTS OF DRUGS. (J.J.)

'Narcotics are substances which lessen our relationships with the external world' (T. L. Bunton).

Narcotic is a word rapidly giving place in scientific uses to terms of more exact signification, such as anaesthetic, analgesic, hypnotic, somnifacient, and delirifacient (H. C. Wood). Great confusion also exists at present as to the proper classification of the various substances. (C.F.H.)

Nascent [Lat. *nascere*, to be born]: Ger. *anfangend*, *wachsend* (*steigende Vorstellung*, Herbart—K.G.); Fr. *naissant*; Ital. *nascente*. Germinal: applied to a developing thing or psychological state before it reveals its positive character.

The term incipient is used with a similar meaning, but the emphasis is rather on the undeveloped than on the hidden character of what is incipient.

Nascent was more in use (e.g. by Spencer) before the rise of the theory of the SUBCONSCIOUS (q.v.). The postulate of 'nascent' psychological states was especially convenient in association theories in cases where clear and positive psychological elements could not be discovered (cf. James' criticism of Spencer in *Princ. of Psychol.*, i. 148 ff.). Writers of other schools find equal convenience in the use of the terms implicit and potential. (J.M.B.—G.F.S.)

National Wealth: Ger. *Nationalvermögen*; Fr. *richesse des nations*; Ital. *ricchezza nazionale*. (1) Measured as a 'fund' (capital), the amount of useful things existing in a country at a given time. (2) Measured as a 'flow' (income), the goods produced and services rendered during a given period. (3) Popular, the money value of (1).

Also called public or social wealth; distinguished from property, which consists of rights or titles to parts of national wealth.

We must beware of confounding public wealth with public property. Waterworks and railroads owned by private companies are just as much part of the national wealth as municipal waterworks or national railroads.

We must also beware of treating an increase or diminution of private property at any point as clearly indicating a corresponding change in national wealth. If a useful article becomes abundant, it means a great increase in national wealth; but the price of the article in question may fall as fast as the abundance increases, and leave no apparent effect on private wealth. (A.T.H.)

Nationality [Lat. *nationalis*, pertaining to birth]: Ger. *Nationalität*, *Volksthum*; Fr. *nationalité*; Ital. *carattere nazionale*. The term expresses properly the quality of being a nation or belonging to a nation; it is improperly used as the equivalent of nation.

It is not easy to say what constitutes a nation, although a common language and the belief, at least, in a common origin seem to be the most essential elements in nationality. To occupy, or rather to have occupied, at some period of history, a common territory seems only a less important requisite. A common national character and common institutions have often been produced by community of race, language, and territory, and have in turn deepened nationality. Some of the best known nations fulfil very imperfectly these conditions. The inhabitants of the United States are a nation; but although they occupy a common territory and speak a common language, they are of different descents. The Scottish nation is made up of two peoples very different in their origin, which down to quite recent times spoke totally distinct languages. The Swiss nation is made up out of fragments of the German nation, of the Italian nation, and of a Romance population akin to the French, each speaking its own language and notoriously of different origins. The Belgian nation is similarly composed of Flemings and Walloons. In these cases unity of territory,

unity of political institutions, and unity of patriotic feeling serve to constitute an artificial nationality. On the other hand, the Hebrews, who for many centuries past have not inhabited the same territory or been subject to the same government, and who have learnt to speak many alien tongues, still constitute a nation bound together partly by common descent, but much more by a religion of the antique tribal type. Thus we see that nationality is not merely an affair of race or of language, or of a common territory, or of common political institutions, or of common civilization, but depends in different cases more or less upon each or some of these unifying circumstances. Indeed, any large mass of human beings which feels itself to be one for any great purpose not merely spiritual is on the way to become a nation. Down to the time when Christianity was first preached, most religions had been national and had tended to strengthen nationality, but Christianity, and after it Mohammedanism, appealed to mankind at large. In the 19th century it was often laid down that every nation ought to enjoy political independence, but this feeling is very recent. In the ancient world the political unit was not the nation, but the city, canton, or tribe. In the mediaeval world states were based not on nationality, but on the principles of feudal law. In modern times the stronger and better organized nations have subjugated and sometimes absorbed their weaker neighbours. The Socialists very generally decry nationality and propose to found political institutions on a totally different basis. Surveying history as a whole, we cannot say that either political unity and independence, or even the conscious wish for them, is essential to nationality. (F.C.M.)

Nativism [Lat. *natus*, from *nasci*, to be born]: Ger. *Nativismus*; Fr. *nativisme*; Ital. *nativismo*. The theory according to which, in the several departments in which it is advocated, this or that is native, inherent, or constitutional. See the next topic.

Cf. A PRIORI, KANTIANISM, INNATE IDEAS, and INTUITION (nativism of knowledge); EXTENSION, SPACE, and TIME (nativism of space and time); ACQUIRED AND CONGENITAL CHARACTERS, and CONNATE (nativism in biology). (J.M.B.)

Nativism (1) and (2) **Empiricism** (in epistemology): for foreign equivalents see the separate topics. (1) Nativism seems to be a convenient name for the common theory that certain assignable parts of our knowledge

are caused by mental properties which are connate with every mind and the same in all.

This theory has generally been held in opposition to the theory that all our knowledge is due to or caused by experience, but it is in reality only one of several alternatives which might be opposed to that theory. Thus it is no mark of nativism to hold: (i) the generally admitted theory that the knowledge of any individual mind is not wholly due to its own experience, and is therefore partly caused by its native constitution; (ii) that the native constitution of any individual mind is not wholly or even at all due to the inherited results of its ancestors' experience, but partly or wholly to what is called accidental variation or to other unknown causes not included under that description; (iii) that all knowledge, including experience itself, is partly caused by such a native constitution.

It is essential, however, to nativism proper that it should hold, in distinction from (ii), that either every mind or every human mind has some native properties, which are the same in all, and cannot therefore have been gradually acquired by the successive action of various causes; and in distinction from (iii) that part of our knowledge can be distinguished as in no degree caused by the native properties which it asserts to be the cause of another part. The part of our knowledge which it thus asserts to be due to the native constitution of our minds is our knowledge of necessary truths, and the part which it asserts to be in no degree due to the same cause consists of sense impressions or perceptions (see *Empiricism*, below).

Thus understood, the term will obviously apply to the well-known 'theory of innate ideas'; and perhaps it may also properly include Kant's transcendentalism, although it may be contended that, according to this theory, the universal properties of mind, to which knowledge is partly due, do not exist in time, and cannot therefore be properly said to be native or congenital. However that may be, transcendentalism and nativism have in common this difficulty, that they allow sense-impressions to be the necessary occasion even for the knowing of those truths, the knowledge of which they assert to be due to the native or essential constitution of the mind. This admission would seem to imply that the native or essential constitution of the mind is not the sole cause of any cognition whatever, but that its joint action with

sense-impressions is necessary for the production of our knowledge of necessary truths, whereas that part of our knowledge which consists in or is produced by sense-impressions is entirely independent of its action.

It must be admitted, however, that the supporters of both doctrines do not seem generally to have recognized this as a consequence of their admission. They seem to wish to maintain that there is something in our knowledge of necessary truths which is *solely* due to the constitution of the mind and entirely independent of the action of sense-impressions. Their theory would seem to be that the occurrence of sense-impressions is only necessary to make us conscious of something of which the complete cause was present in the mind before their occurrence. Thus the 'theory of innate ideas' seems to hold this complete cause to consist in the 'idea' of that truth whereof we afterwards become conscious. Against this view it must be urged that our consciousness of anything is not divisible into two distinct parts: (a) the mere being-conscious, (b) that which distinguishes this instance of consciousness from another, such that the one part might have one cause and the other a totally different one. Some particular consciousness and not mere consciousness is the smallest mental element for which a distinct cause can be assigned; nor do the supporters of either doctrine expressly deny this. If, therefore, we are to say that there is something in the consciousness of necessary truths, in the production of which sense-impressions do not in any way co-operate, this can only be the truth itself. This certainly cannot be in any way due to the occurrence of sense-impressions, since it is not a thing which exists at any particular moment of time. But then, for the same reason, it can have no cause at all.

There seems good evidence, however, that it is the nature of necessary truths themselves which makes the supporters of nativism and transcendentalism anxious to maintain that there is something in our knowledge of them entirely independent of the influence of sense-impressions. Both doctrines, in fact, strenuously maintain that necessary truths are *logically* independent of sense-impressions, and both frequently fail to distinguish this contention from that by which they are to be defined, namely, that our knowledge of necessary truths is *causally* independent of sense-impressions; that is, both contentions remain undistinguished in the usual form in which

their common creed is expressed: 'necessary knowledge is independent of experience or *a priori*.' The definition of nativism is, then, perhaps best completed by the proviso that 'parts of our knowledge' is sometimes to be understood as equivalent to 'some of the truths which we know.'

(2) EMPIRICISM (q. v., 2) is a term in much more common use, and would seem to be best defined (a) as a characteristic of some philosophical disquisitions consisting in the fact that their arguments and conclusions largely presuppose the principle that all known truths assert something about what exists at one or more moments of time.

(b) The definition in Webster's *English Dictionary* (ed. 1891)—'The philosophical theory which attributes the origin of all our knowledge to experience'—is, however, commoner. Cf. EMPIRICISM (1).

To definition (b) it may be objected (i) that empiricism is not a theory, because there would seem to be no one express principle or combination of principles which is enunciated by all empiricists and rejected by all other philosophers. An empiricist is recognized rather by the general character of his arguments and conclusions than by any principle from which he professes to deduce them. (ii) That this general character consists in the fact that his arguments or conclusions, very various in other respects, exhibit the constant influence of some principle, of which he may or may not be conscious, would perhaps be generally admitted. But a principle can only be said to influence arguments and conclusions where there is either an actual or an apparent logical relation between them and it. But even where one proposition only *appears* to have a logical relation to another, it really has this relation to some other proposition which may be easily confused with that to which it appears related; and further, in a continuous philosophical disquisition, not only that which appears to have this relation, but also that which really has it, will in general be expressly stated. It may, therefore, be fairly assumed that wherever philosophic reasoning is influenced by a principle, this principle will be actually presupposed by many of the propositions occurring in its course. (iii) That empirical reasonings can only be defined by the fact that they *largely* presuppose a certain principle, is due to the fact that they always also presuppose others contradictory of this one, and that they do not at all points presuppose this. Thus an empiricist can only

be distinguished from other classes of philosophers by the degree of frequency with which this presupposition occurs. (iv) That the principle, by the presupposition of which empiricism must be defined, is not 'that experience is the origin of all our knowledge,' needs longer discussion. This principle would, indeed, be commonly held to characterize empiricism, either as presupposition or as theory. Objection must, however, be taken to it in the first place on the ground of its ambiguity. 'Experience' would be admitted by all to be an ambiguous word; and the words 'origin' and 'knowledge' involve the twofold ambiguity, pointed out in the definition of nativism, as to whether 'cause' or 'logical premise' be meant by the one, mental state or that which is known by the other. When, however, all ambiguity is removed, it will be found that the only part of its meaning which will really serve to characterize empiricism is the principle given in the definition first given.

History. (1) *Nativism.* The early Greek philosophers, notably Heraclitus, had already made that distinction between truths of reason (λόγος) and truths of sense (αἴσθησις) which was ultimately to be connected with nativism; but they seem to have seen no reason to assign a different origin to the knowledge of these different kinds of truth. Their theory of the origin of knowledge was that the mind (generally conceived as material) and the object always co-operated in producing it; and they attributed to the mind no greater share in producing the one kind than the other. Protagoras and the Sophists, however, used this theory in order to draw sceptical consequences; and Plato, while he seems to have accepted both it and these consequences with regard to sensation, was therefore bound to give some other account of the origin of true knowledge (ἐπιστήμη νοητῶν), which it was his main aim to vindicate against scepticism. Hence his famous theory of ἀνάμνησις, viz. that our knowledge of necessary truths or 'ideas' is a remembrance of truths learnt by the soul before birth—a remembrance which is excited by sensations, but which, since its objects are not temporary, cannot be caused in the same way. It is, however, doubtful how far he himself intended this theory to be allegorical, since he always concerned himself rather with the truth of necessary knowledge and its intrinsic difference from sense-knowledge than with its origin. In Aristotle, speculations as to the origin

of knowledge are even less prominent; but there seems to be no doubt that he seriously held the view that every man was endowed from his birth with a reasoning faculty, which was the same in all men, and was the source and potentiality (δύναμις) of abstract knowledge, although it required the stimulation of sense to actualize this knowledge. It is from the Stoics that the word 'innate' (ἐμφυτος, innatus), as applied to truths, seems to be derived. They seem to have applied it to truths of reason (especially to moral principles), and they undoubtedly held that we were only able to know this kind of truths, owing to the immanence in us of the universal reason; but in harmony with their materialistic conceptions of reason, they seem to have thought that truths of this kind were logically identical with sensible truths, and hence they seem to have regarded the innate *logos* not even, like Aristotle, as a virtual knowledge of truths different from those of sense, but merely as a power of recognizing what was given in sense. Nevertheless, their doctrine, through its extreme popularity and adoption by the Romans, seems to have been the chief means of perpetuating a nativistic theory of rational knowledge. In the middle ages, again, interest was centred rather upon the nature of what is known than upon the causes of our knowing it. The realists, however, who contended for the separate reality of universals as something different from sensible objects, always tended to defend nativistic doctrines against the nominalists, who, adopting the view which Aristotle opposed to Plato, that the universal is real only in the particular, unintentionally went very much further than Aristotle in maintaining as his doctrine 'Nihil esse in intellectu, quod non prius fuerit in sensu.' In modern philosophy nativistic theories of the origin of necessary knowledge were strongly held by Descartes and by Leibnitz; the latter, especially, in opposition to Locke, gives to the theory far greater precision than it had hitherto possessed. Kant differs from him chiefly in supposing that the innate cause of necessary knowledge does not *resemble* that knowledge itself, and the great influence of his theory in this respect finally put an end to the doctrine of 'innate ideas' as such. It was only in the latter half of the 19th century that the question of nativism was connected with that of inheritance. It had never before been clearly recognized that the knowledge of a single individual, even if entirely attributable

to experience, could certainly not be attributed solely to his own. But, this once recognized, the doctrine that it could be attributed to the inherited results of ancestral experiences was seen to be 'inconsistent with the famous theory of Weismann that no acquired characteristics can be inherited. Accordingly there arose a new division between theories of the origin of knowledge, according as Weismann's view was adopted or denied, and it is mainly in connection with this question that the term 'nativism' has been used.

(2) *Empiricism*. In the sense defined it is plain that all the early Greek philosophers, with the possible exception of the Eleatics, were empiricists. But that there was possible in philosophy that kind of difference in principle, which is vaguely denoted by the term empiricism, was first recognized by Plato, in consequence of the irreconcilable differences of Socrates and the Sophists, which were not, like the differences of earlier philosophers, capable of being specified as differences of opinion as to what existed, but seemed to proceed from something which was equally compatible both with agreement and with difference on such points. Plato uses the word *ἐμπειρία* to denote that way of acquiring knowledge, as to a thing's effects, which consists in frequent use of the thing—a sense more closely analogous to that preserved in the word 'empiric' than to that of the philosophical term 'empiricism.' He opposes it to *λογισμός*; and the knowledge thus acquired to *ἐπιστήμη*. But his term for 'experience,' in the sense above defined, is rather *αἴσθησις*; *ἐμπειρία* denoting the manner in which experience gives rise to other knowledge, without the intervention of inference. Much the same use of terms is continued by Aristotle, but in him it has not the same importance as a method of classifying philosophies. The Stoics are a good instance of non-empirical philosophers, who nevertheless appear to have expressly held the theory generally taken to be characteristic of empiricism: they recognized constantly truths different from objects of experience, without recognizing that these truths were thus different. The Epicureans, on the other hand, were both actual and avowed empiricists. From the extinction of the Epicurean school till the close of the middle ages there was no empirical philosophy. The nominalist Schoolmen, as has been said, sometimes avowed a principle similar to that of empiricism; but just as they falsely thought this principle was held by Aristotle, so they agreed with him

in many respects in which he is very far from empirical. Bacon, in pleading the cause of experimental inquiry, could not but avow empirical tenets; but his philosophy, so far as he has any, cannot be classed as empirical. Hobbes is probably the first noted empirical philosopher of modern Europe; but in the history of empiricism the influence of Locke is far more important. He not only definitely avows, but continually implies the principle, that all the knowledge of every individual is caused by the action of objects upon his mind; and though he admits that we have some necessary knowledge, it is only such as he could easily believe to be analytical. The theory that objects cause our knowledge of them was expressly given up by Berkeley and by Hume; but they did not cease to imply it; and both their avowed and their implied views of necessary truths are the same as that of Locke. It was Kant who, by his recognition of necessary synthetic truths, first brought into prominence the necessary distinction between the causal and the logical origin of knowledge: accordingly it is since his time that the term empiricism has been most commonly and significantly used in the classification of philosophers, although never yet with a clear recognition that the sole basis of the classification is the logical and not the causal question. English philosophy has continued to be empirical during the greater part of the century; but owing to the influence of Kant's proof that some necessary truths, particularly the law of causation, are synthetic, the interpretation of them as universal has been more commonly adopted by empiricists, especially by J. S. Mill. At the same time, while it is generally held that experience is due to the action of objects upon our minds, the theory that the constitution of our minds has no influence upon the character of our knowledge has been generally seen to be absurd.

Literature: PLATO, *Meno*, *Phaedo*, *Theaetetus*; ARISTOTLE, *De Anima*; ZELLER, *Stoics*; LEIBNITZ, *New Essays*; LOCKE, *Essay on the Human Understanding*; KANT, *Krit. d. reinen Vernunft*; J. S. MILL, *Logic*; W. JAMES, *Princ. of Psychol.*, chap. xxviii. (G.E.M.)

Nativity [Lat. *nativitas*, birth]: Ger. *Nativität*; Fr. *nativité*; Ital. *natività*. The doctrine of the birth of Christ, including its time, mode, and commemoration.

The birth of Christ occurred probably four years prior to the date fixed by current chronology. The season of the year is con-

jectural. According to the Scriptural account and the belief of the Church the conception of Christ was miraculous. Early in the history of the Church the doctrine of the Immaculate Conception was broached, and became a subject of controversy throughout the middle and later centuries of church history, being finally promulgated as the accepted doctrine of the Roman Catholic Church in 1854 by a bull of Pius IX. The date of Christmas, the official commemoration of the Nativity, was fixed by the Romish Church on evidence that at best yields only a degree of probability.

Literature: see JESUS CHRIST, and ADVENT. (A.T.O.)

Natura naturans, and **Natura naturata**: see NATURE.

Natura non facit saltum [Lat.]. 'Nature makes no leaps': the principle of continuity or uniformity of natural operations. Cf. UNIFORMITARIANISM.

The principle has new meaning in view of the theory of EVOLUTION (q. v.). (J.M.B.)

Natural [Lat. *naturalis*]: Ger. *natürlich*; Fr. *naturel*; Ital. *naturale*. In accordance with, belonging to, or derived from nature.

While the term is derived from and associated, philosophically as well as etymologically, with the term NATURE (q. v.), it has selected especially one side of the meaning of that term, namely, that which is in accordance with the course of events, that which is regular, stated, and usual. The sense of physical has thus dropped into the background, though still apparent in such phrases as natural science and natural philosophy. A double meaning, that is, a higher and a lower sense, corresponding to similar connotations of nature, still persists, however, in its ethical implication. (1) On one side, that which is regular and uniform is that which is to be expected; it is the normal, that from which as a standard all departures are measured, and is opposed to the artificial as the purely factitious and strained. As norm, the word gets a highly ideal import, often being the highest term of commendation, as in popular aesthetic judgment of a picture, or in social intercourse, in judgment of a personality. (2) In its theological use, however, it is identified with the carnal, base, or worldly—thus the term 'natural man' in the writings of St. Paul, and through him in theology generally. (3) In a midway or neutral sense the term natural is simply opposed to that which is supernatural or revealed, and then may be further supplied with a good or bad sense, according

to the disposition of the writer—as natural religion, natural theology. (4) It is also defined as that which belongs to men, by and from birth, as opposed to which has been acquired historically or conferred by political authority—as NATURAL RIGHTS (q. v.) distinguished from POSITIVE RIGHTS (q. v.). (J.D.)

Natural Dualism: see NATURAL REALISM.

Natural History: Ger. (1) *Naturwissenschaft* (wider than natural history), (2) *Naturgeschichte*; Fr. *histoire naturelle*; Ital. *storia naturale*. (1) Description of the objects found in terrestrial nature. The term is still used as a convenient collective designation for physiography, geology, mineralogy, botany, zoology, and anthropology, with emphasis on the biological sciences, especially since 'history' has become illuminated by the theory of evolution. Consequently an easy transition is made to the following meaning. (2) Record or history of natural occurrences; in this sense sometimes applied to the development and evolution of mind. (C.S.M.—J.M.B.)

Natural Law: see LAW, and PRINCIPLE, and cf. SCIENCE.

Natural Law or **Law of Nature** (in political philosophy): Ger. *Naturrecht*; Fr. *loi naturelle*; Ital. *legge naturale*. (1) A law of which the precepts are not of deliberate human institution, but arise spontaneously, in the manner of instincts. (2) A law which, however it arises, is the fulfilment of implanted instincts and capacities, and is the condition or way of their development.

Most of the ambiguities attaching to the term NATURE (q. v.) attach also to the Law of Nature. The German distinction between *Naturrecht* and *Natargesetz* is inadequately rendered by our 'principles of law' and 'enactment.' There is the further difficulty of so interpreting 'law' as to avoid the suggestion of a legislator or the analogy of the uniformities of physical science.

The most imposing use of the term was made by the Stoics. The term was revived by Grotius when he based international law on law of nature. Hobbes and Spinoza recur to the first sense more bluntly. The second is the sense in which the term and idea have been defended by Krause, Stahl, Lorimer, Ahrens, T. H. Green, and Herbert Spencer. Bentham, Lewis, and Stephen are the chief critics. (J.B.)

Literature: HERBERT SPENCER, *Man versus the State*, 87 ff.; JAS. LORIMER, *Inst. of Law* (1880); KRAUSE, *Syst. d. Rechtsphilos.*; STAHL, *Philos. des Rechts*; AHRENS, *Cours de Droit naturel*; T. H. GREEN, *Works*,

ii, Political Obligation; BENTHAM, Mor. and Legisl., chap. ii; CORNEWALL LEWIS, Use and Abuse of some Political Terms; LESLIE STEPHEN, English Thought in the 18th Cent.; ARDIGÒ, Sociologia. (J.B.)

Natural Realism: Ger. *natürlicher Realismus*; Fr. *réalisme naturel*; Ital. *realismo naturale*. The theory that in the fact of perception, as a veracious datum and testimony of consciousness, a knowledge both of mind and matter is indubitably given. The same as Natural Dualism. Cf. REALISM, PRESENTATIONISM (1), and COMMON SENSE.

The term is defined as used by Hamilton. See his edition of Reid, Note A, § i, and *Discussions on Philos.*, 55. (J.D.)

Such natural realism as is held by the naïve (i.e. unreflecting) or ordinary man is called 'naïve realism.' (J.M.B.)

Natural Religion: Ger. *natürliche Religion*; Fr. *religion naturelle*; Ital. *religione naturale*. Religion in so far as it may be derived from nature and reason and from the constitution of man, without the aid of supernatural revelation.

Natural stands contrasted here with supernatural and includes rational. It excludes but does not deny supernaturalism. The naturalistic theory of religion does, however, deny the supernatural, and derives all religious truth from natural sources. But natural religion does not need to occupy this exclusive ground. It may simply rest on the assumption, which all will concede, that man is either a religious being by nature or that he is capable, by the exercise of his unaided power, of apprehending certain religious ideas and of developing a religious experience.

Literature: see RELIGION, and SUPERNATURALISM; the Bridgewater Treatises; SEELEY, Nat. Religion. (A.T.O.)

Natural Rights: Ger. *Naturrechte*; Fr. *droits naturels*; Ital. *diritti naturali*. The claims founded on the law of nature.

The expression played a part in early Greek speculation among the Sophists, who appealed to natural rights as founded on natural law in the sense of elementary instincts of human nature. In Locke's writings and in the political creed of the United States and the French Revolutionaries something of the second sense of NATURAL LAW (q.v.) is mingled, and in the background (as long before with Hobbes) there is a supposed STATE OF NATURE (q.v.). (J.B.)

Natural Selection: Ger. *natürliche Auslese* (or *Züchtung*); Fr. *sélection naturelle*;

Ital. *selezione naturale*. The theory that the struggle for life due to the rate of multiplication of animals and plants and to other conditions, results in the survival of those individuals having the most advantageous variations; and thus leads, by accumulation through a series of generations, to evolution. See SELECTION (in biology), and EVOLUTION; and cf. EXISTENCE (struggle for), EXCESS, PRODIGALITY OF NATURE, MALTHUSIANISM, SURVIVAL OF THE FITTEST, and VARIATION.

The two men whose names will always be associated with this great hypothesis, Charles Darwin and Alfred Russel Wallace, were led independently to the same conclusions by their memory of the *Essay on Population* by Malthus. Darwin had reflected much on evolution during the voyage of the *Beagle* (1831-6), and on his return home opened a notebook, in July, 1837, in which to record all facts bearing on the process and its possible causes. He says in his *Autobiography*: 'I soon perceived that selection was the keystone of man's success in making useful races of animals and plants. But how selection could be applied to organisms living in a state of nature remained for some time a mystery to me.' Various possible causes of change passed through his mind and were dismissed as inadequate, until, in October, 1838, he read Malthus, and the idea of the survival of favourable and the extinction of unfavourable variations at once occurred to him. In 1842 he wrote a short account of the theory, which he expanded into an essay of 231 folio pages in 1844, but continued to observe and experiment, and could not be induced by his friends to publish until on June 8, 1858, he received a manuscript essay from Wallace, who was then at Ternate in the Molucca Islands. In this essay, entitled 'On the Tendency of Varieties to depart indefinitely from the Original Type,' Darwin found a complete exposition of his own hypothesis. 'If Wallace had my manuscript sketch written out in 1842, he could not have made a better short abstract! Even his terms now stand as heads of my chapters,' he wrote to Lyell. Sir Charles Lyell and Sir Joseph Hooker, whose advice Darwin sought, decided that Wallace's essay should at once be published, but that it should be accompanied by an abstract of Darwin's own work. The joint paper was read before the Linnean Society of London, July 1, 1858, with the title, 'On the Tendency of Species to form Varieties; and on the Perpetuation of Varieties and Species by Natural

Means of Selection.' Thus the phrase 'natural selection' first came before the world.

Probably the essential difference between this and all other theories of the motive cause of evolution is the clear appreciation of the intensity of the struggle for existence as well as its significance in the origin of species. On this point the minds of the two discoverers ran in such parallel grooves that Darwin insists on the 'struggle for life,' Wallace on the 'struggle for existence.' A brief account of 'sexual selection' is included in Darwin's essay. This most memorable episode was the beginning of a life-long friendship between the two men. Wallace, like Darwin, had been convinced of the truth of evolution itself before natural selection occurred to him. The hypothesis flashed across him suddenly in Feb. 1858, when he was lying ill in bed with fever and was thinking of the 'positive checks' described by Malthus. In two hours after this he had 'thought out almost the whole of the theory,' and in three evenings had finished his essay. Darwin's chief work appeared on Nov. 24, 1859, with the exact title, *On the Origin of Species by means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*. The whole edition of 1,250 copies was sold on the day of issue. The plan of the book is remarkable: it begins with an account of natural selection, then considers special difficulties in the way of a belief in natural selection and in evolution, and ends with the evidences for evolution. In this arrangement there is the recognition of the fact that it was hopeless to expect a belief in evolution until some intelligible motive cause had first been suggested.

It is especially noteworthy that the theory makes no attempt to explain the origin of the individual variations upon which it is based. It rests upon the demonstrable fact of their existence. Furthermore, the variations which form the material for the operation of selection are inherent and hereditary, thus differing from the 'acquired' characters or MODIFICATIONS (q. v.) upon which Lamarck based his hypothesis. Although Darwin incorporated a certain element of LAMARCKISM (q. v.) in his conception of evolution, it formed no part of his own theory of natural selection.

Natural selection has been criticized by those who suppose that a non-useful stage is an early but essential phase in the development of every character. Thus the Duke of Argyll spoke in this sense of 'prophetic germs.' Dohrn was the first to meet this difficulty

by the hypothesis of 'change of function' (Functionswechsel), in which he suggested that new organs are rarely formed *de novo*, but are produced by modification of the function and subsequently of the structure of pre-existing organs. The recent hypothesis of ORGANIC OR INDIRECT SELECTION (q. v.) also materially assists in early beginnings and transitional stages. It has furthermore been objected that the process of natural selection is necessarily so slow that geological time would have been wholly insufficient for evolution thus caused. This objection does not take into account the very different rates at which evolution by natural selection must be supposed to have proceeded when a change in the organic or geographical conditions has upset a pre-existing equilibrium between the inhabitants, animal and vegetable, of any district. In those areas upon the earth's surface where such an organic balance is, from the nature of the case, less exposed to disturbance, evolution has proceeded at a slower rate. Thus certain islands still contain the forms which have been replaced by more modern products of evolution upon the adjacent continental areas. In the greatest depths of the ocean the conditions, both organic and inorganic, have been more persistent than in any other part of the globe, and there evolution has been slowest. In the brachiopods especially we meet with forms which appear to have undergone no progressive evolution since Cambrian times. This association between persistent conditions and arrested evolution is explained by the followers of Buffon on the ground that variation is the direct effect of changed conditions, and is at its minimum when conditions are constant, while Lamarckians believe that variation is the indirect effect of the same cause through its operation as a stimulus to individual desire and effort. The convinced natural-selectionist holds that arrested evolution is not due to the absence of sufficiently large individual variation, but a natural result of the successful adaptation of a species to conditions which remain permanent, when the average fertility of the species exactly compensates for the average loss. He holds that the characters relied on by the followers of Buffon and Lamarck are 'acquired,' and incapable of hereditary transmission, and can only assist evolution indirectly by means of 'organic selection.' Cf. ACQUIRED AND CONGENITAL CHARACTERS, and HEREDITY.

The natural-selectionist further holds that

such beneficial acquired modifications are themselves due to one of the highest reaches of natural selection in rendering the individual capable of an adaptive response to the stimulation provided by external conditions or its own activities. Cf. PLASTICITY.

Evolution normally proceeds from the selection of the ordinary minute differences which distinguish the individuals of a species, and which are present during a state of evolutionary arrest no less than in one of rapid progress. Changed conditions lead to progress by establishing a new or a higher selective 'mean' rather than by acting directly upon the selected material. This, at least, is the conclusion to be reached by a study of the animal world.

There are, however, many facts and observations which lead to the conclusion that changed conditions may evoke hereditary variation in plants. It may well be that evolution by selection operates in two ways upon the higher groups of the vegetable kingdom, with their comparatively passive relation to environment, and the liability of species to be driven out of existence by environmental change. In the first place, there is the ordinary operation of selection upon the ever-present individual differences; in the second, the germinal constitution of such plants may have been rendered by natural selection especially sensitive to changed conditions, so that fresh hereditary material may be afforded to selection by the very changes which might otherwise have been fatal to the existence of the species.

Quite apart from this special question, affecting a certain proportion of the vegetable kingdom, the character of the variational material upon which selection operates has been the subject of much difference of opinion. Darwin originally believed that large variations like those made use of in artificial selection played a part, although not a very important one, in evolution. Fleeming Jenkin's essay convinced him that their effect is nothing as compared with that of ordinary minute individual differences. The belief in large variations has been recently revived by Bateson, and has been supported by F. Galton in connection with the idea of a prepotent hereditary influence. Evolution by the selection of large variations would be discontinuous (Bateson) or transilient (Galton) as contrasted with the smooth continuous history of change dependent on the selection of minute individual differences. Under the topic MUTA-

TION (q. v.) it is shown that the paleontological record, wherever complete, represents such a history rather than the discontinuous advance demanded by the former conception.

T. H. Huxley was never completely convinced of the efficacy of natural selection, because the domestic breeds or races produced by man, while differing in structure far more than many natural species or even genera, are still completely fertile *inter se*. Until this usual characteristic of natural species could also be reproduced by experimental selection he was unable to give more than a qualified assent to the theory of natural selection. But Darwin never believed that mutual sterility was produced by direct selection in nature, so that, if he is right, the production of mutual sterility by experiment, although most interesting in itself, would be the production of a common natural result by means which are not adopted in nature. Darwin looked on mutual sterility as an incidental rather than a direct result of species separation, and pointed out that it was most irregular in its occurrence, so that an immense number of plants considered to be true species are still perfectly fertile *inter se*. The late G. J. Romanes, in his hypothesis of PHYSIOLOGICAL SELECTION (q. v.), on the other hand, placed mutual sterility as the basis, instead of the climax, of a large amount of species formation, viz. of all cases in which interbreeding was not prevented in some other way. The fact that so many natural species can still produce hybrids, while others are even perfectly fertile when brought together, supports the Darwinian conception, and leads to the belief that our domestic breeds will need separation until some immensely remote epoch before the same incidental results can be expected to manifest themselves. If they did so now they would furnish no experimental verification of the natural condition.

The following interpretation of sterility between species is consistent with Darwin's views. The germ substances which meet in fertilization are of infinite complexity, and require the most exact adjustment the one to the other if the union is to be fertile. The adjustment is often inexact between individuals of the same species, but natural selection rigidly keeps up the standard among the individuals of a species so long as these constitute a single organic whole interbreeding together. As soon, however, as a species separates into two groups of individuals which do not interbreed, natural selection

can only keep up the standard of fertility within each group, and not between the two groups; for while unfertile unions within each group are rigidly excluded by selection, those which would have been unfertile between the two groups, but are nevertheless fertile within each group, are encouraged by selection. We witness a condition in which complete sterility between the two groups is certain to be attained after the lapse of an immense period of time in consequence of the mere cessation of selection. Cf. FERTILITY, STERILITY, and REPRODUCTIVE SELECTION. (E.B.P.)

The accompanying diagram may serve to illustrate the theory of evolution which makes exclusive use of the principle of natural selection. In its 'pure,' or Neo-Darwinian, or Weismannian form, it is contrasted with LAMARCKIANISM or ORTHOGENESIS (q. v.) and with ORTHOPLASY (q. v.). Under those terms similar diagrams are given, with which this may be compared.

Neo-Darwinism or Weismannism. LL', line of evolution; 1, 2, &c., successive generations by physical heredity; cm, cm', &c., congenital mean; v, v', variations (congenital). Evolution is by selection of variations added to the congenital mean from generation to generation.

Among the questions which arise in the interpretation of natural selection are: (1) In what sense is this principle a 'force' or 'motive force'? (cf. Darwin's discussion with Asa Gray, given in Poulton, *Charles Darwin*): cf. FORCE AND CONDITION, and BIONOMIC FORCES. (2) What relation does this principle sustain to others which claim to be FACTORS OF EVOLUTION (q. v.)? (3) That of the operation of natural selection in MENTAL EVOLUTION (q. v.). (J.M.B., E.B.P.)

Literature: CHARLES DARWIN, *Life and Letters* (London, 1887); *Origin of Species*; Linn. Soc. J., 1858; A. R. WALLACE, Linn. Soc. J., 1858; *Tropical Nature and Natural Selection*; and Darwinism; T. H. HUXLEY, *Life and Letters* (1900); Anonymous, *Quart. Rev.*,

art. on Huxley (Jan., 1901); E. B. POULTON, *Charles Darwin and the Theory of Natural Selection* (London, 1896); W. BATESON, *Materials for the Study of Variation* (London, 1894); FLEEMING JENKIN, *North Brit. Rev.*, June, 1867; H. F. OSBORN, *From the Greeks to Darwin* (N. Y., 1894). For recent expositions see ROMANES, *Darwin and after Darwin*, i; CONN, *The Method of Evolution* (1900); HEADLEY, *Problems of Evolution* (1901); GROOS, *The Play of Animals* (Eng. Trans.); COPE, *Primary Factors of Organic Evolution* (Lamarckian). The authors cited under LAMARCKISM nearly all criticize natural selection. (E.B.P.—J.M.B.)

Natural Theology: Ger. *natürliche Theologie*; Fr. *théologie naturelle*; Ital. *teologia naturale*. The systematic treatment of the problems of God's existence, nature, and relations, in so far as it proceeds upon natural and unrevealed data.

The idea of natural theology is positive and proceeds on the assumed possibility of obtaining knowledge of God from the natural resources of human reason. It is opposed to agnosticism on the one hand and to the claims of an exclusive supernaturalism on the other. The science is as old as Socrates and the design argument. The earliest modern treatise on natural theology is the *Theologia Naturalis* of Raymond de Sabunde in the 15th century. The 18th century was prolific of works in natural theology, that of Paley standing pre-eminent. The criticism of Kant was supposed to have given the science its death-blow, and later the design argument was thought to have received its quietus from Darwin. But the result has been revolution and reconstruction along profounder and more comprehensive lines rather than destruction.

Literature: HUME, *Dialogues on Natural Religion*; KANT, *Criticism of Theistic Proofs*, in *Critique of Pure Reason*; FLINT, *Theism and Anti-Theistic Theories*; PHYSICUS, *Candid Exam. of Theism*; the *Bridgewater Treatises*; JANET, *Final Causes*; LE CONTE, *Evolution of Religious Thought*; STERLING, *Philos. and Theol.* (A.T.O.)

Naturalism [Lat. *naturalis*, natural]: Ger. *Naturalismus*; Fr. *naturalisme*; Ital. *naturalismo*. (1) The theory that the whole of the universe or of experience may be accounted for by a method like that of the physical sciences, and with recourse only to the current conceptions of physical and natural science; more specifically, that mental and moral processes may be reduced

to the terms and categories of the natural sciences. It is best defined negatively as that which excludes everything distinctly spiritual or transcendental. In this meaning it is about equivalent to POSITIVISM (q. v.). (J.D.)

(2) Synonymous with MATERIALISM (q. v.).

(3) There is a growing use of the term to indicate a view which simply limits itself to what is natural or normal in its explanations, as against appeal to what transcends nature as a whole, or is in any way supernatural or mystical.

This is established in the case of the adjective NATURAL (q. v.), as in the claim that the mental and moral sciences should be classed with the 'natural' as opposed to the physical sciences. The term naturalist is also used for a scientific investigator in the biological and psychological, not in the physical, sciences. Besides this demand for the term naturalism as the theory of what is natural, including the mental and moral, from the side of science, a similar usage has come from theological study, where we have naturalism in interpretation and in doctrine opposed to supernaturalism; that is, naturalism is the appeal to natural occurrences of the mental and moral order as opposed to miracles, divine enlightenment, &c. Cf. also NATURALISM (in art).

It is extremely desirable that this distinction of usages should be recognized. Note the controversy occasioned by Balfour's *Foundations of Belief*, arising from the protests of naturalists (sense 3) against his description of naturalism (sense 1). In view of the oscillation of the philosophical term (cf. Ward, *Naturalism and Agnosticism*), the third usage is in many respects to be preferred. For the other meanings we have POSITIVISM and MATERIALISM covering the whole ground. And it is a false position from the start, as the development of science shows, to limit nature to physical nature, and that minus animated nature. Indeed, the development in the meaning of natural to include man is so firmly established that it were better to yield up the word naturalism altogether to go with it. (J.M.B.)

Naturalism (in art). A theory which holds it to be the true end of art to 'follow nature.' The rendering of a landscape or human character without subjective idealization; without omission of elements that are opposed to the personal or average taste and conscience. It is, however, distinguished from realism by implying faithfulness to the forces at work rather than minute copying of details. (J.H.T.-J.D.)

The term has had a varying meaning according to varying interpretations of the phrase 'follow nature' (see ART, II). At present the naturalistic school of art is characterized especially by individualism—emphasis upon the CHARACTERISTIC (q. v.) and often upon the unpleasant aspects of nature (by way of emphasizing the significant as over against the formally beautiful). It has been defined as 'science applied to literature,' since both science and art are by it regarded as seeking 'truth.'

In German, however, 'minute copying' is the rather associated with naturalism, not with realism; but usage is not well fixed. Alt (*Syst. d. Künste*, 1888, 19) says, 'The method which aims at the complete reproduction of all the details of sense-phenomena is, in our as yet incompletely developed terminology, called *naturalism* in contrast to realism, which aims to construct a picture only of the most striking phases of the object.' (K.G.)

Literature: VOLKELT, *Aesth. Zeitfragen* (1895), chap. v; STEIN, *Entsteh. d. neueren Aesth.* (1886), 81-270, 325 ff.; HÖFFDING, *Rousseau* (1897), 104 ff.; ZOLA, *Le Roman Expér.*; GUYAU, *L'Art au point de vue sociol.* (1889), 143 ff.; BRANDES, *Die Hauptströmungen in d. Literatur* (1892); BRAITMEYER, *Gesch. d. poet. Theorie u. Krit.* (1888-9); M. PILO, *Estetica* (1898). (J.H.T.)

Naturalism (in theology). The doctrine which excludes the supernatural from the religious realm, and refers the facts of religion either to the operation of natural agencies and laws, or to the divine conceived as identical with the natural order of the world. Cf. NATURALISM.

The naturalistic tendency in religion has been greatly strengthened by the doctrine of evolution. The tendency of naturalism is not so much to deny the divine agency as to merge that agency in the operations of nature.

Literature: H. BUSHNELL, *Nature and the Supernatural* (1876); WARD, *Naturalism and Agnosticism* (1899). See SUPER-NATURALISM. (A.T.O.)

Nature [Lat. *natura*, from *nasci*, to be born or produced; an equivalent of the Gr. *φύσις*, from *φύω*]: Ger. *Natur*; Fr. *nature*; Ital. *natura*. The word has a primary double sense, each of these meanings having in turn a number of subdivisions. (1) In the first place, nature means whatever (literally or figuratively) is born with the thing, and hence belongs originally to its own being instead of being acquired or superadded.

It thus means (a) the constitution, native

structure, essence, or very being of a thing. Thus we speak of the nature of anything—of a horse, stone, man, star, thought, soul, God, &c. The Scholastics used the term as equivalent, objectively or as regards the existence concerned, to essence, but as connoting more especially not the being in itself, but (*b*) considered as the active source (or principle) of the operations by which the being realized its destined end. Here is the transition to the second meaning.

(2) Nature is the sum total of forces which animate the created world, or the aggregate of events and changing things which make it up.

In this conception two quite distinct meanings are obviously contained. In one meaning, nature is conceived (*a*) as the dynamic agent concerned in bringing about the changes in the world. It is at least semi-personified. Thus the Scholastics talked of nature doing this and that; of various forces and qualities as the various modes of the operation of nature, &c. This use of nature, as a cause at large, was seized upon by Comte (see POSITIVISM) as a sign of the 'metaphysical' stage of thought, distinguished equally from the theological, where God is the active cause, and the positive or scientific, where search for efficient agents is given up, and simple sequences and coexistences are traced. Under (2, *a*) we again have a subdivision, according as nature is conceived (*a*) as an independent, self-active agent, as in various forms of pantheism and mysticism, or as (*β*) a subordinate principle, a secondary cause, intervening between God as efficient principle and the details of existence. In its other meaning (*b*)—under (2)—nature is regarded as simply the name given to the sum total or phenomena in time and space; the physical world as presented to the senses. It is expressly restricted to phenomena, in their material relations to one another; and the idea of productive or formative agency is excluded. It is equivalent to the physical world, the realm of things and events with which physical science deals.

Few terms used in philosophy have a wider or a looser use, or involve greater ambiguity. While often used as equivalent to the mechanical and material world, as a system of particular objects and changes, it rarely quite loses its sense of primordial, primitive, intrinsic, or, indeed, of something dynamic and productive; and so the term is used in an active or passive, a spiritual or material sense, about as the writer pleases.

It is not surprising, then, that historically we find it used to mark off, in a most definite way, the world from God, and again to identify the world with God, and once more to afford a connecting principle between God and the details of the world. Its various sub-meanings can, however, best be brought out in connection with the history of the term.

It is perhaps the oldest of all formulated and general philosophic concepts—that is, in its Greek form φύσις. Aristotle expressly calls the earlier philosophers (particularly the Ionic school) physicists (φυσικοί) and physiologists (φυσιολόγοι) to express their pre-occupation with nature as the object of philosophy. Περὶ φύσεως (concerning nature) is the putative, traditional, or actual title of the writings of Xenophanes, Melissus, Parmenides, and Heraclitus. The term began with that wide and vague sense which has always hung about it—something designating the whole world, considered not as a chaos of particular things, but as referred to some general principle for explanation or to account for its production. Thus the statement of Windelband (*Hist. of Philos.*, 73, Eng. trans.) that the 'constitutive mark of the concept φύσις was originally that of remaining ever like itself,' its contrary being the transient, is altogether too narrow. While the chief object of interest to the 'physiologues' was what we should term the physical world, and their categories are, to us, of a physical sort (fire, air, water, &c.), yet it must be remembered that no clear distinction of mind and matter had yet been made; nature was conceived of as living and, in so far at least, as psychical; the scheme, in a word, was HYLOZOISM (q.v.), not materialism. It was with Plato that the distinction between the physical and the metaphysical was clearly stated, and thus the tendency initiated to use the term nature in a restricted sense which marked it off from the spiritual; it was the sphere of becoming, as distinct from that of being, and hence was contingent, and the object of probable knowledge only. (God as distinct from φύσις was the ὁθεὶν φέρεται.) But it was far from being identical with what we should term nature in the purely physical sense, the term σῶμα much more nearly expressing that. Moreover, in general and in detail, a teleological explanation of nature was required by which it was subjected to the good and to reason (see NOUS). In Aristotle, this Platonic conception of nature joined with a strain derived from the Sophists, and the term got for the

first time a complete, explicit statement—the term, though not the idea, being rather incidental in Plato. In their political and ethical discussions, the Sophists (Hippias, see Xenophon, *Mem.*, iv. 14 ff.) had raised the question as to whether obligation exists by nature (φύσει) or by institution or convention (θέσει or νόμῳ). This gave rise to the conception of nature as a standard or norm that could be used to justify objective validity as distinct from arbitrary assertion or merely subjective convenience. The dramatists (Sophocles, *Antigone*) had already developed the conception of a law of nature which was universal and eternal, and the ethical industry of Socrates was devoted to establishing the existence and worth of such a law-giving nature. Hence, in Aristotle we have the conception of nature as, on one hand, the system of moving, changing things so far as directed to realizing an end, or (in their totality) the end, the absolute good; and, on the other, as the standard by reference to which all particulars of a given class, as well as all failures, deviations, and abnormalities, are to be measured; while it is distinguished from art because its efficient cause is internal, and not external. It is in this sense, for example, that man is, by nature, a political animal, and that the state is, by nature, prior to the individual citizen.

This conception, like the rest of the Aristotelian philosophy, was reformulated by the Scholastics, and thus has become (in the popular sense of nature as at once a productive force and the standard of order and regularity) a part of the ordinary view of the world. But there are two elements involved in the Aristotelian conception; and even if we grant that his own synthesis was adequate, it was hardly possible that later writers should not emphasize one factor or the other. On the one hand, there is the mechanical element—the physical is just the realm of extended and movable bodies, being thus distinguished from both the metaphysical and the teleological (*Met.*, vi. 1, and *De Caelo*, i. 1).

In the Epicurean philosophy, this conception becomes dominant and exclusive; the teleological factor, the reason or end, which, according to Aristotle, had animated the complex of moving bodies, is absolutely eliminated; and nature is simply the sum total of the mechanical impacts and arrangements of the purely quantitative elements, the atoms. This is the view which found its classical expression in the *De rerum Natura* of

Lucretius, a poem which perhaps has done more than any one other cause to give to the term its limited, purely physical, content.

But all the order and uniformity and system (orderly unity) of nature is due, according to Aristotle, to the fact that it represents the transition of the potential to completion, under the teleological influence of forms, and of the supreme FORM (q.v.), God. In it, so far as it is really nature, nothing is superfluous, nothing perverted, nothing happens just by accident. It is an organic whole (ζῶον). This aspect is emphasized by the Stoics (Strato being the connecting link, Windelband, 179), save that, denying the transcendence of form and nous, nature is regarded as self-moved, both efficiently and teleologically. Nature is not merely ordered and attracted to perfection by God; it is God. It is itself law, cause, standard, and providence. 'To live in accordance with nature' is the sum of all virtue. Nature is also used by the Stoics, in a restricted sense, as the peculiar animating principle of the plant, as distinct from the ζῆς of the inorganic, the ψυχὴ of the animal, or the νοῦς of man (Erdmann, *Hist. of Philos.*, i. 189, trans., and Zeller).

With Plotinus, nature again assumes a definite intermediate position, established, however, on the basis of emanations, not upon a teleological one. As NOUS (q.v.) comes below the supreme and ineffable One, so nous subdivides into a higher and lower soul (ψυχὴ), the higher which contemplates and enjoys the rational forces (νοῖ) which make up the νοῦς: the lower, which after the archetype thus contemplated, carries them into act and thus creates the objective world. This lower soul is nature—equivalent practically to the world soul of Plato and the λόγος σπερματικός of the Stoics. In the middle ages three strains appear. One is the orthodox scholastic, following Aristotle, expressly defining nature as the essence of anything, so far as it operates in a regular way to bring the thing to its appointed end. Another is the mystic, which continued the Platonic and Neo-Platonic sense, but in a more pantheistic way, tending to make nature the mysterious, vital creative energy of God. The third is the Arabian interpretation of Aristotle. Averroes, like the Stoics, interpreted Aristotle so as to deny the transcendent nous; form and purpose are wholly immanent in nature. Hence the distinction of nature (*De Caelo*) into *Natura naturans*, equivalent to God, the one reality viewed as active, as form and force, and into

Natura naturata, the world as materialized form, as effect (see Siebeck, *Arch. f. Gesch. d. Philos.*, iii. 370, for origin of this distinction). The two terms made their way both among the Mystics and the Scholastics, being adapted to their respective uses. They appeared with Cusanus and Giordano Bruno, and (probably) from them made their way into Spinoza. With him, in scholastic fashion, the nature of a thing is its essence and its idea (*Ethica*, iv. def. 8); and so the supreme essence is also *Natura*, *Natura naturans*, or *Deus*, while the world of modified existences is *Natura naturata* (i. pr. 29, schol.). In his earlier writings he distinguishes the latter into *generalis* and *particularis*, but abandons this in the *Ethics*.

Modern thought has added no essentially new elements to the concept of nature. It has, however, clearly brought out the homogeneity of nature, its identical structure and operation in all its parts, mundane and stellar, thus effectually doing away with the ancient conception of a diversity of grades, values, and qualities, a conception which, more than any other, is the philosophical idea underlying modern science (Windelband, loc. cit., 402). So far as science is concerned, the mechanical conception of nature may be said to have become, through the writings of Descartes, Galileo, Hobbes, and Newton, completely victorious, as against the Platonic and Aristotelian conceptions. The problem still remains, however, whether, taken as a totality and system, nature does not demand a rational and teleological valuation; and thus at the Renaissance, in the 17th and again in the 19th century, have arisen philosophic systems which have insisted that nature as a totality or system is an expression of thought, and which have attempted, with varying degrees of success, to combine a modified Aristotelianism with the detailed results of contemporary science.

This found its most ambitious expression in the so-called *Naturphilosophie* of Oken, Schelling, and Hegel, in the early part of the 19th century. In another connection the names of Rousseau and Goethe need special mention. Rousseau's motto and warcry was 'Return to Nature,' and in his treatment of the idea all the various senses and ambiguities were rolled into one. Nature meant at once the historically primitive and original; that which is distinct from art and the artificial; that which is opposed to the politically instituted; and that which is normative and ideal. In formulating the opposition between nature and culture he

stimulated Herder and Schiller (as well as many others), and was, indirectly, an important factor in the development of the Modern German philosophy of history and society. Goethe, moved by the discussion, was led back to Spinoza; revived Spinoza's conception of nature, giving it, however, a thoroughly dynamic and organic interpretation, and by embodying it in his poetry, as well as in his prose criticism and his scientific efforts, influenced not only the *Naturphilosophie* movement already referred to, but all modern literature and aesthetic theory. (J.D.)

Nature (law of): see NATURAL LAW.

Nature (moral): Ger. (*sittliche*) *Natur*; Fr. *nature morale*; Ital. *natura morale*. The constitution of man as a being capable of morality, i. e. as a being at once sentient and rational, whose sentient nature can be rationalized.

Plato held that human nature is an economy or constitution, like a state, in which each part has its appropriate work to do for the nature as a whole. Human virtue or excellence accordingly consists in the harmonious activities of all the parts in the interest of the total welfare of the soul. Aristotle held that the proper or characteristic activity of any being is determined by its specific nature, and that, since man's specific nature is rationality, his true life is an activity 'according to right reason.' The Stoics regarded human nature as part of the nature of things, and held that to live 'according to nature' or according to the reason which is the pervading nature of the universe, is the sum and substance of morality. The early British rationalists (Cudworth, More, Clarke) also held that man as a moral or rational being was capable of discerning the rational nature of things, and that moral distinctions are 'eternal and immutable.' Butler returned to the Platonic or psychological view of moral nature as a constitution, in which there are various principles, differing in rank or authority, as well as in power, among which conscience occupies the supreme place. According to the associationist and utilitarian school, the moral, like the intellectual nature of man, is derivative, not original; complex, not simple. The evolutionists see in it the changing product of the evolutionary process, the result of the action and reaction of man and his environment, physical and social. The idealists seek to establish the ultimateness and absoluteness of the moral nature, Kant regarding it as noumenal or transcendent, Hegel and his followers finding in it

the highest expression of the principle of thought of the universe. Cf. ETHICS, and ETHICAL THEORIES.

Literature: many general works on ETHICS (q. v.), also BIBLIOG. F, i, d. (J.S.)

Nature (philosophy of): Ger. *Naturphilosophie*; Fr. *philosophie de la nature*; Ital. *filosofia della natura*. That branch of fundamental philosophy which deals with NATURE (q. v.): co-ordinate with theology (philosophy of God) and with rational psychology or philosophy of spirit (as philosophy of man). Often used synonymously with cosmology.

For the earlier history see NATURE. Kant first connects it expressly with the modern scientific view of the world, and defines it as the attempt to carry back the facts and forces of physical science to a limited number of forces—in his own theory, attraction and repulsion. His own philosophy is dynamic, but in a mechanical sense. Schelling emphasizes, on the side of method, the self-contained, non-empirical character of *Naturphilosophie*; and, in content, the dynamic-organic concept. According to Hegel, it takes up into itself all the results and methods of physics, but develops them, showing they do not have their basis in experience, but constitute a self-included, necessary whole derived from thought itself (Begriff).

The content of the system is found in the dialectic sequence which takes us from the extreme externalization of thought (space and time) to its internalization in sentient life—living and feeling organisms. With the latter, the philosophy of spirit takes up its tale, since thought is now coming to conscious recognition of itself. The philosophy of nature soon fell into disrepute, partly because of the arbitrary and artificial use made of its categories; and even more largely because the manifold results of the continually multiplying specialisms in science defied all attempts at reduction to a few fundamental principles. Spencer has revived the notion (though not the term) in his attempt to connect the phenomena of life, mind, and society by the formula of evolution, in a way which reduces all facts to terms of integration of motion and differentiation of matter. There are many signs of attempts to reinstate a philosophy of nature in connection with the idea of evolution, often in a sense quite divergent from Spencer; but the special sciences still lack organization, both themselves and in relation to one another, to an extent which makes the problem the most

baffling of all the phases of philosophy to-day. Among recent English-speaking authors, Tyndall, Huxley, John Fiske, Cope, and Le Conte have occupied themselves particularly with the philosophic interpretation of scientific phenomena. In Germany the names of Lotze, Fechner, Haeckel, Wundt, Ostwald, and Mach are prominent. (J.D.)

Nature (state of): see STATE OF NATURE.

Nature Worship: Ger. *Naturverehrung*; Fr. *culte de la nature*; Ital. *culto della natura*. The worship of natural forces or objects, or of these as embodied or symbolized in living or quasi-living forms.

Religions are classifiable under the categories of nature and ethics. The objects of worship in the nature-religions are fundamental forces of nature to which the processes of hypostatization and ethical personalization have been applied in various degrees.

Literature: ANDREW LANG, art. Religion, Encyc. Brit. (9th ed.). (A.T.O.)

Naturism [Lat. *natura*, nature]: Ger. *Naturismus*; Fr. *naturisme*; Ital. *naturismo*. The theory that the primitive form of religion was the deification of nature. See the works cited under RELIGION (philosophy of). (J.M.B.)

Nazarites [Gr. *Ναζαῖταις*; Heb. *nazar*, to separate oneself]: Ger. *Nazariten*; Fr. *Nazareens*; Ital. *Nazareiti*. Among the ancient Hebrews, devotees of either sex who had taken an oath to abstain from wine and strong drink, from cutting the hair, and from ceremonial uncleanness.

The vow of the Nazarite was either limited or for life. For its conditions and the mode of its fulfilment see Numbers vi in the Old Testament Scriptures. (A.T.O.)

Near-sightedness: Ger. *Kurzsichtigkeit*; Fr. *myopie*, *vue basse*; Ital. *vista corta*. A popular term for MYOPIA (q. v.).

Nebular Hypothesis: Ger. *Nebular-Hypothese*; Fr. *hypothèse de la nébuleuse primitive*; Ital. *ipotesi della nebulosa*. The doctrine that the primæval form of the matter composing the bodies of the universe was that of a glowing gas or nebula, and that the earth, sun, planets, stars, and all other seemingly solid bodies of the universe were formed by the cooling and consequent condensation of this gas.

Somewhat obscurely conceived by Swedenborg; more definitely outlined by Kant and Laplace (*Système du Monde*); developed by Herbert Spencer as one of the general processes of evolution; and reduced to the form of a physical theory by Geo. H. Darwin. (S.N.)

Necessaries [Lat. *necessarius*, indispens-

able]: Ger. *Gegenstände des Lebensbedarfs*; Fr. *le nécessaire* (sing.); Ital. *il necessario* (sing.). Commodities whose use is indispensable for the maintenance of economic efficiency (cf. LUXURIES).

It follows from this definition that things which are necessities for one man, increasing his economic efficiency more than in proportion to their cost, may be luxuries to another with whom their use is not accompanied by such increase of efficiency.

We must beware of defining necessities as things which a man needs in order to keep alive. This definition rests on a very superficial view of the distinctions involved. Those who use a definition of this kind are compelled to create a class of 'decencies' intermediate between necessities and luxuries. A decency is a commodity which is not necessary in the superficial sense, but which the experience of the community has so far proved to be necessary in the deeper sense that it insists on having it without really stating or knowing the reason why. (A.T.H.)

Necessary: see NECESSITY.

Necessary (1) and (2) **Sufficient Condition**: Ger. (1) *notwendige* und (2) *hinreichende Bedingung*; Fr. (1) *condition nécessaire* et (2) *condition suffisante*; Ital. (1) *condizione necessaria* e (2) *condizione sufficiente*. An event, *p*, is a sufficient condition of another event, *q*, if whenever *p* happens *q* happens; *p* is a necessary (or essential, or, better still, indispensable) condition of *q* if *q* does not happen unless *p* happens.

These are phrases which the mathematicians find indispensable; it would add greatly to clearness on the part of writers on logic if they were to become familiar phrases with them as well.

These relations are, as far as their logical significance is concerned, nothing more than those which are expressed, for terms, by the first two forms of the simple PROPOSITION (q.v.), (a) *All a is b* and (ū) *None but a is b*. To say that all citizens are voters and that none but citizens are voters is the same thing for logic (that is, as statements that are to constitute the premises and the conclusions of arguments) as to say that being a citizen is the necessary and sufficient condition of being a voter; and, again, it is the same as to say, in terms of extension instead of intension, that citizens are identical-with voters. Another name for indispensable condition is *conditio sine qua non*. As proof of the urgent necessity for more exact nomenclature in connection with these two relations, see the remarkable footnote in Sigwart's *Logik*, 286 (Appendix

II in the English translation). Usually a condition is used as meaning an indispensable condition, and *the* condition as meaning, more or less loosely, the necessary and sufficient condition. (C.L.F.)

Necessary (in logic): Ger. *notwendig*; Fr. *nécessaire*; Ital. *necessario*. That is necessary which not only is true, but would be true under all circumstances.

Something more than brute compulsion is, therefore, involved in the conception; there is a general law under which the thing takes place. Thus necessity, in the philosophical sense, is quite opposed to any '*Noth*' that '*kennt kein Gebot*.' Springing from law, and thus being essentially rational, it would perhaps be more accurately described as persuasive than as compulsive.

The Stoics defined the necessary as 'that which, being true, is not susceptible of becoming false, or, if it be so, is prevented from ever becoming false' (Diog. Laer., vii. 75). Kant defines the necessary as that which is *a priori* certain (*Krit. d. reinen Vernunft*, 1st ed., 125).

Necessary adjunct: a phrase which a very improper usage makes to signify a property, that is, an inessential predicate, not only belonging at all times to every individual of the species of which it is a necessary adjunct, but further, belonging to nothing else.

Necessary cause: one which acts by a necessity of its nature and is not free.

Necessary object, says Kant, is one which is determined according to concepts by the connection of perceptions (*Krit. d. reinen Vernunft*, 1st ed., 234).

Necessary sign: a sure indication. (C.S.P.)

Necessitarianism [Lat. *necessitas*, necessity]: Ger. *Necessitarianismus*, *Nothwendigkeitsgläubiger* (a necessitarian, Barth); Fr. *nécessitarisme*; Ital. (not in use). See DETERMINISM. (J.S.)

Necessity [Lat. *necessitas*]: Ger. *Nothwendigkeit*; Fr. *nécessité*; Ital. *necessità*. (1) The state or condition that cannot be otherwise than it is; that must be just as it is.

(2) The principle in virtue of which the condition of the universe as a whole, or any particular part of it, is rendered, both as to its existence and quality, inevitable. Opposed to both freedom and chance, but especially, in its strictly philosophical use, to CHANCE (q.v.) or contingency. That which has the property of necessity is said to be necessary.

It is frequently used to designate the chief principle of those philosophies which admit

only the principle of cause and effect, and which deny purposiveness to the universe. Technically, various forms of it have been recognized. (1) Logical (also metaphysical) necessity: the necessity of thought in virtue of which a truth, either immediate or inferential, must be conceived in such and such a manner; thus freedom itself would be a logical necessity if it followed, in accordance with the principles of identity and non-contradiction, from conceded premises. (2) Mathematical necessity: the similar logical relationship of parts of a demonstration or construction in mathematical reasoning. (3) Physical (also natural) necessity: that which arises from laws of nature or which arises in the course of nature from the principle of causation: mechanism, the 'reign of law'; invariable sequence, according to modern writers, e.g. J. S. Mill. (4) Moral necessity: that required by moral law, by the moral order of the universe; that which follows from the nature of God as a moral governor; also used in a narrower sense, as equivalent to 'practical' necessity, which is neither logical nor physical, but the result of a certain need or demand regarded as of fundamental importance (see POSTULATE).

These distinctions we owe directly to Leibnitz, and they are most fully developed in his *Théodicée*. According to him there are three main types. (a) Metaphysical, logical, geometrical: that which cannot be otherwise than as it is without self-contradiction; absolute necessity. (b) Physical necessity: that of the order of nature, which might conceivably be otherwise, but which follows from the will of God, who has chosen the best world; hypothetical necessity. (c) Moral necessity: that which animates a moral being, even God himself, in the choice of good. Since a perfectly moral being would have a perfectly adequate conception of the good, it would by moral necessity choose it. In this sense, physical necessity depends upon moral necessity. The term is also used in a strictly logical sense, equivalent to APODICTIC (q.v.), and also to designate the opposite of those theories which assert free will (necessitarianism: see DETERMINISM, and WILL).

In the Pre-Socratics, necessity was a quasi-mythical expression for the law or order of the cosmos, as in the teaching of Parmenides that the goddess at the centre of the world is Necessity—an (apparently) Pythagorean conception which finds expression in the myth of Er (Plato, *Rep.*, Bk. X), where the entire universe

is made to revolve upon an axis of necessity. Heraclitus used the idea (in the form of destiny) to account for the fact that a certain balance and system is observed in all change. With the Atomists (Leucippus) it becomes (*ἀνάγκη*) a definite philosophical concept; the atoms, darting about at random, impinge upon one another; from the aggregations thus formed, there is, of necessity, a whirling motion set up. With Plato (aside from incidental and non-technical use of it as equivalent to the force of proof and demonstration) necessity is the co-author, with *νοῦς*, of the sensible world; as irrational it is blind, indifferent to good, since *νοῦς* alone is the principle of ends, or of the good, and hence that which keeps the world in a state of partial non-being and which prevents its arriving at completion (*Timaeus*, 48, 56, 68). Aristotle repeats the same idea (*De An. part.*, IV. ii. 677). Matter resists form, and thus hinders NATURE (q.v.) from arriving at its actualization. (The idea seems to be that in part matter lends itself to the realization of purposes, but in part has an impetus of its own which is quite indifferent to ends.) In this indifference matter is thus contingent—it may or may not present certain traits. As such it is *τύχη*, chance; so that necessity in the physical sense, and chance in the teleological, are practically one and the same thing. Hence, in his logical writings necessity has quite another meaning. Of future events, we cannot make a necessary assertion; the general tendency of nature may be thwarted by chance. Hence our judgment is not of determinate truth. On the other hand, of universals, of past events, &c., any judgment is either necessarily true or false. Here the tendency comes out to identify necessity with the immanent logical rationale of any subject, that from which perfectly definite consequences follow. The Stoics fuse the various senses of necessity—that of (a) the source of physical world-order, (b) the universal of reason from which determined conclusions result, and (c) the natural (or temporal) causal antecedent (Zeller, *Stoics, Epicureans, and Sceptics*, 170-82, and Windelband, *History*, 181). Since the Atomists did not work out their own idea systematically, and even presupposed a more or less random movement upon which necessity supervened, we may fairly regard the Stoics as the authors of the conviction that everything, everywhere, is controlled by necessity admitting of no exception—in other words, of the idea of the

universality of natural causation, which is fate. This conception is common to what is called fatalism, also, in oriental philosophies: the hypothesis of a fixed and immutable world decree.

Spinoza carries the fusion still further by expressly identifying the whole causal relationship with the logical or mathematical—the world follows from the nature of God by the same necessity that various truths follow from a geometrical definition. (It was partly in reaction from Spinoza that Leibnitz made the distinctions referred to above.) It was characteristic of the whole rationalistic school (see RATIONALISM) to identify reality with the requirements of logical necessity, as manifested in the principles of identity and non-contradiction; and if, like Leibnitz, they made a distinction between truths of reason and truths of matter of fact (which are empirical), and thus avoided the Spinozistic identification of logical relationship with natural sequence, it was a concession to common sense rather than a philosophic implication of their system. Kant introduces a new motive. On the one hand, growing natural science had given to the conception of necessity (causal relationship) in nature a solidity and concreteness which it could not have had in earlier writers; on the other hand, he rejects the dogmatic identification of the laws of being with those of logical thought. Hence his theory makes causality and thus necessity absolutely true of all nature, or the world of phenomena, by regarding causation as a category involved in the presentation of the world of sense to an experiencing subject. The source of necessity is thus found in the understanding as applied to sense; so that it may fairly be said that Kant restores in a critical and constructive way that which he had rejected in a dogmatic and formal way, namely, the origin of necessity in reason. At least, this path was followed by his idealistic successors, finding its outcome in the expression of Hegel (*Logic*, § 158), that 'freedom is the truth of necessity,' that is to say, that the determination of one phase of the objective world by another is at bottom but the self-determination of conscious mind, so that the necessary object, when experienced completely, appears as a co-operating factor in the development of free spiritual life. (J.D.)

Literature: Works on metaphysics and logic; G. TAROZZI, *La dottrina della necessità* (2 vols., 1895-7). (J.M.B., E.M.)

The following distinctions are usual:

Internal necessity springs from the nature of the subject of the necessity; *external necessity* comes from the outside.

Internal necessity is either *absolute* or *secundum quid*. *Absolute necessity* belongs to that whose being otherwise would involve contradiction. *Necessity secundum quid* is that which depends upon some matter of fact. Thus the Aristotelians held that a body falls to the ground by a necessity of its own nature, without external force or agency; yet it is easily prevented from falling.

External necessity, also called *necessity ex hypothesi*, because depending on an external condition, is distinguished in whatever ways the necessary is distinguished in the doctrine of the MODAL (q. v.), and, in particular, in reference to the *sensus compositus* and *sensus divisus*. In addition, external necessity is divided according as the realization of the condition precedes, is contemporaneous with, or follows after, the necessary result. Necessity from a previous condition is either that due to God's foreknowledge or it is *causal*. *Causal necessity* (used also in modern logic) is either *necessity of compulsion* or *necessity of determination*.

Necessity determined by a subsequent condition is either *ex hypothesi finis* or *ex hypothesi eventus* (as the apostle says, 'it is necessary that offences should come'). Necessity *ex hypothesi finis* is either *ad esse* or *ad bene esse*.

Another common distinction is between necessity *in causando*, *in essendo*, and *in praedicando*, phrases which explain themselves.

Still another threefold distinction, due to Aristotle (1 *Anal. post.*, iv), is between necessity *de omni* (τὸ κατὰ παντός), *per se* (καθ' αὐτό), and *universaliter primum* (καθόλου πρῶτον). The last of these, however, is unintelligible, and we may pass it by, merely remarking that the exaggerated application of the term has given us a phrase we hear daily in the streets, 'articles of prime necessity.' Necessity *de omni* is that of a predicate which belongs to its whole subject at all times. Necessity *per se* is one belonging to the essence of the species, and is subdivided according to the senses of *per se*, especially into the first and second modes of *per se*.

Among modern distinctions we may mention that of Benno Erdmann between *predicative* and *deductive* necessity. The former seems to be necessity for a judgment being as it is in order to express what is in its immediate object.

Logical necessity is determined by the laws

of the understanding, according to Kant (*Krit. d. reinen Vernunft*, I. Aufl., 76).

Metaphysical necessity is that of God's existence.

Simple = *absolute necessity*. See above.

The adjectives by which different kinds of necessity are usually distinguished include absolute, antecedent, causal, comitant, composite, consequent, deductive, disjunct, disjunctive, external, formal, hypothetical, immediate, internal, logical, material, mediate, metaphysical, modal, moral, physical, practical, predicative, prime, simple, teleological, unconditional. (C.S.P.)

Necromancy: see MAGIC.

Need [AS. *nyd*]: Ger. *Bedürfniss*; Fr. *besoin*; Ital. *bisogno*. A constitutional or acquired craving or want, either bodily, revealing itself also in consciousness, or mental.

Needs are deep-seated demands of nature; appeased by recurrent satisfactions; extremely painful or depressing if not satisfied; and often acting as subconscious motives which influence action without taking form as conscious ends. (J.M.B., G.F.S.)

Negation [Lat. *negatio*, which translates Gr. ἀπόφασις]: Ger. *Verneinung*; Fr. *négation*; Ital. *negazione*. Negation is used (1) logically, (2) metaphysically. In the logical sense it may be used (a) relatively, and (b) absolutely. Used relatively, when applied to a proposition, it may be understood (a) as denying the proposition, or (β) as denying the predicate.

(1) In its logical sense, negation is opposed to affirmation, although, when it is used relatively, this is perhaps not a convenient contrary term; in its metaphysical sense, negative is opposed to positive (fact, &c.).

The conception of negation, objectively considered, is one of the most important of logical relations; but subjectively considered, it is not a term of logic at all, but is pre-logical. That is to say, it is one of those ideas which must have been fully developed and mastered before the idea of investigating the legitimacy of reasonings could have been carried to any extent.

The treatment of the doctrine of negation affords a good illustration of the effects of applying the principle of PRAGMATISM (q.v.) in logic. The pragmatist has in view a definite purpose in investigating logical questions. He wishes to ascertain the general conditions of truth. Now, without of course undertaking to present here the whole development of thought, let it be said that it is found that the first step must be to define how two

propositions can be so related that under all circumstances whatsoever,

The truth of the one entails the truth of the other,

The truth of the one entails the falsity of the other,

The falsity of the one entails the truth of the other,

The falsity of the one entails the falsity of the other.

This must be the first part of logic. It is deductive logic, or (to name it by its principal result) syllogistic. At all times this part of logic has been recognized as a necessary preliminary to further investigation. Deductive and inductive or methodological logic have always been distinguished; and the former has generally been called by that name.

In order to trace these relations between propositions, it is necessary to dissect the propositions to a certain extent. There are different ways in which propositions can be dissected. Some of them conduce in no measure to the solution of the present problem, and will be eschewed by the pragmatist at this stage of the investigation. Such, for example, is that which makes the copula a distinct part of the proposition. It may be that there are different ways of useful dissection; but the common one, which alone has been sufficiently studied, may be described as follows:

Taking any proposition whatever, as

'Every priest marries some woman to some man,'

we notice that certain parts may be struck out so as to leave a blank form, in which, if the blanks are filled by proper names (of individual objects known to exist), there will be a complete proposition (however silly and false). Such blank forms are, for example:

Every priest marries some woman to

—,

— marries — to some man,

— marries — to —.

It may be that there is some language in which the blanks in such forms cannot be filled with proper names so as to make perfect propositions; because the syntax may be different for sentences involving proper names. But it does not matter what the rules of grammar may be.

The last of the above blank forms is distinguished by containing no selective word such as some, every, any, or any expression equivalent in force to such a word. It may be called a PREDICATE (q.v., sense 2) or ῥήμα.

Corresponding to every such predicate there is another, such that if all the blanks in the two be filled with the same set of proper names (of individuals known to exist), one of the two resulting propositions will be true, while the other is false; as

Chrysostom marries Helena to Constantine;

Chrysostom non-marries Helena to Constantine.

It is true that the latter is not good grammar; but that is not of the smallest consequence. Two such propositions are said to be contradictory, and two such predicates to be negatives of one another, or each to result from the negation of the other. Two propositions involving selective expressions may be contradictory; but in order to be so, each selective has to be changed from indicating a *suitable selection* to indicating *any selection that may be made*, or vice versa. Thus the two following propositions are contradictory:

Every priest marries some woman to every man;

Some priest non-marries every woman to some man.

It is very convenient to express the negative of a predicate by simply attaching a *non* to it. If we adopt that plan, *non-non-marries* must be considered as equivalent to *marries*. It so happens that both in Latin and in English this convention agrees with the usage of the language. There is probably but a small minority of languages of the globe in which this very artificial rule prevails. Of two contradictory propositions each is said to result from the *negation* of the other.

The relation of negation may be regarded as defined by the principles of contradiction and excluded middle. See LAWS OF THOUGHT. That is an admissible, but not a necessary, point of view. Out of the conceptions of non-relative deductive logic, such as consequence, coexistence or composition, aggregation, impossibility, negation, &c., it is only necessary to select two, and almost any two at that, to have the material needed for defining the others. What ones are to be selected is a question the decision of which transcends the function of this branch of logic. Hence the indisputable merit of Mrs. Franklin's eight copula-signs, which are exhibited as of co-ordinate formal rank. But, so regarded, they are not properly copulas or assertions of the relation between the several individual subjects and the predicate,

but mere signs of the logical relations between different components of the predicate. The logical doctrine connected with those signs is of considerable importance to the theory of pragmatism.

For the negation of modals see MODAL.

Conversion by negation = CONTRAPOSITION (q. v.).

Negant or *negative negation* is the negation effected by attaching the negative particle to the copula in the usual Latin idiom, 'Socrates non est stultus,' in contradistinction to *infinite* (*ἀπείρως*), or *infinitant, negation*, which is effected by attaching the negative particle to the predicate, 'Socrates est non stultus.'

Kant revived this distinction in order to get a triad to make out the symmetry of his table of categories; and it has ever since been one of the deepest and dearest studies of German logicians. No idea is more essentially dualistic, and distinctly not triadic, than negation. *Not-A = other than A = a second thing to A*. Language preserves many traces of this. *Dubius* is between *two* alternatives, yea and nay.

(2) In the metaphysical sense, negation is the mere absence of a character or relation that is regarded as positive. It is distinguished from privation in not implying anything further.

Spinoza's celebrated saying, of which the Schellings have made so much, 'omnis determinatio est negatio,' has at least this foundation, that *determinatio* to one alternative excludes us from another. The same great truth is impressed upon youth in the utterance: 'You cannot eat your cake and have it too.' (C.S.P., C.L.F.)

Predicates are not denied to subjects at hazard—it would be a great waste of time to set forth in language the fact that the vast majority of predicates are inapplicable to the vast majority of subjects. In order that a negative statement may have any value, there must have been some reason to suppose that the affirmative statement of which it is the exact denial was true, either that it had been proposed for our acceptance by an interlocutor, that it had been part of our stored-up knowledge or purported knowledge, or that we had in mind what we took at the moment to be sufficient ground for its acceptance. Sigwart is, therefore, right in maintaining that the negative statement, in its origin, is not of the same primitiveness as the affirmative statement; '*a* is not *b*' is merely a

shorter form, permitted by language, for 'that a is b is false,' or 'that a is b is non-occurent.' Cf. JUDGMENT, ad fin. (C.L.F., J.M.B.)

Negative [Lat. *negativa*; a term appearing first in logic in Boethius, in place of the previous *abdicativa*, although *negatio* was much earlier. It translates Aristotle's ἀποφατική. Cognate words were used by Plato, and even earlier]: Ger. *verneinend*; Fr. *négatif*; Ital. *negativo*. Involving NEGATION (q. v.), either in the second application of the logical sense, or in the metaphysical sense given under that term.

Negative abstraction is an act of abstraction derived from considering something which does not possess the character considered.

Negative (or necessary) condition: see NECESSARY AND SUFFICIENT CONDITION.

Negative criterion: a criterion which is a negative condition; a test. Most criteria are of this sort.

Negative discrepancy: see DISCREPANCY.

Negative distinction: a mutual real distinction separating anything from its negation; as the distinctions of heat and cold (no heat), light and darkness (no light), sound and silence (no sound).

Negative idea: see *Negative name*.

Negative mark: a mark which consists in the non-occurrence of a positive phenomenon under certain conditions.

Negative name: a common name which characterizes an object by its want of some character. 'I appeal,' says Locke, 'to every one's own experience, whether the shadow of a man, though it consists of nothing but the absence of light (and the more the absence of light is, the more discernible is the shadow), does not, when a man looks on it, cause as clear and positive an idea in his mind as a man himself, though covered over with clear sunshine? And the picture of a shadow is a positive thing. Indeed, we have negative names, which stand not directly for positive ideas, but for their absence, such as *insipid*, *silence*, *nihil*, &c., which words denote the positive ideas, *taste*, *sound*, *being*, with a signification of their absence' (*Essay concerning Human Understanding*, II. viii. 5).

Negative negation: see NEGATION.

Negative syllogism: any syllogism of the second figure, or the *modus tollens*, where the reasoning turns upon the change of quality. The canon of syllogism, that nothing can be concluded from two negatives, is inaccurate. What is requisite, in non-relative syllogism, is that the middle term should be once dis-

tributed and once undistributed. Darapti and Felapton, which appear to violate this rule, only do so because one of the premises, so far as it is efficient, is virtually a particular. What is requisite is, that one of the interlocutors should select the individual denoted by the middle term in one premise and the other in the other.

Negative whole is one which has no parts; as God, the soul, &c. (C.S.P.)

Negative term. Negation arises first, without doubt, in connection with the judgment—it is a secondary function of thought, which presupposes the existence of positive judgments (Hamilton, Sigwart, Wundt). It is true that the concept cat cannot be formed by the child except by separating out a certain quality-complex from a background of all that is other than cat; but this background exists in its mind only vaguely, like images upon a retinal periphery, and until it has become a distinct object of consciousness it does not constitute a concept. Later, thought permits itself to affirm not only that a is not b , but also that a is not- b . The concept not- b is, in many cases, no more difficult to form than the concept b ; it is frequently hard to say which of two concepts, as odd or even, to greet an acquaintance or to cut him, is positive and which is negative—to be immortal means to continue to live, and to be mortal means not to continue to live. But this similarity between positive and negative terms holds only so long as the quality which constitutes their signification is one and indivisible. Terms in general are implements for holding together a certain group of objects, each in the possession of a certain complex of marks; a negative term has for its denotation all other objects in the universe of discourse, whatever that may be, and for its connotation the absence of some one at least of the elements of the complex of marks signified by the positive term. The group of objects to which a negative term applies is all the objects other than those to which the positive term applies; for signification there is not, it is true, any mark common to this group of objects (for in general they have no such mark), but this is merely to say that a negative name has no positive concept corresponding to it (Keynes). The significations of the positive term and of the negative term are very different; the one involves a combination of quality-elements, the other an alternation of absences of quality-elements. When, therefore, Lotze says that it remains a for ever

insoluble task to abstract the qualities of the *not-man*, he says what is true but unimportant. *Not-man* is not destitute of import, as Lotze says it is, but its import consists in an *alternation of deficiencies of some one, at least, of the elements of the intent of man.* (C.L.F.)

Negative Sensation: Ger. *negative Empfindung*; Fr. *sensation négative*; Ital. *sensazione negativa*. Sensation due to stimulus beneath the THRESHOLD (q.v.).

Used by Wundt (*Physiol. Psychol.*, 3rd ed., 384), who gives the negative sensation a greater value as the stimulus continues to sink, until at zero stimulus the negative sensation is infinite, and is 'more undetectable than any other undetectable sensation.' All of which, in the opinion of some, is reine Mythologie. (J.M.B.—G.F.S.)

Negative Variation: Ger. *negative Schwankung, Actionsstrom*; Fr. *variation négative*; Ital. *variazione negativa*. Decrease of the muscle or nerve current upon tetanizing an excised muscle or nerve.

Since any portion of a muscle or nerve which is active becomes electrically negative to resting portions, the term 'action current' is to be preferred to negative variation, and has come into general use in its stead.

The phenomenon was discovered independently by Matteucci and Du Bois-Reymond, 1840-3. (C.F.H.)

Negativism: see UNKNOWNABLE, and cf. AGNOSTICISM. See also PSYCHOSIS.

Negativity and Negation (Hegel's *Negativität* and *Negation*): see HEGEL'S TERMINOLOGY, Glossary, sub verbiis.

Negligence (in law) [Lat. *negligentia*]: Ger. *Fahrlässigkeit, Nachlässigkeit*; Fr. *faute, négligence*; Ital. *negligenza*. Acting or omitting to act without due care to avoid or prevent injury to others.

Due care is that which, under the circumstances of the particular case, is required by the rules of law. It may, by one of these rules, be such care as a man of ordinary prudence in such a situation would reasonably be expected to use. To constitute *actionable negligence* there must be an obligation towards the party who claims the right of action to use care, and a breach of that obligation to his injury (Markby's *Elements of Law*, § 681; Holland, *Jurisprudence*, chap. viii. 98, 99). *Contributory negligence* is a bar to an action for negligence, and means negligence of the plaintiff materially contributing to produce the injury of which he complains. *Gross negligence* is the absence of even slight care.

'Gross negligence is not actionable where not even slight care was due. However blameworthy, it is still essentially different from intentional wrongdoing' (Beers v. Boston and Albany Railroad Co., 67 Conn. Law Reports, 427). Under the doctrine of *Respondeat superior*, a master may be liable for his servant's negligence, and may be liable for negligence in employing a careless or incompetent servant, by whose act another suffers.

Negligentia does not seem to have been actionable, at Roman law, unless it so infringed upon the rights of others as to constitute *culpa*. 'Magna negligentia culpa est' (*Dig.*, l. 16, *de verborum significatione*, 226). See Cushing, *Introd. to Roman Law*, § 369 ff.; Morey, *Outlines of Roman Law*, 349. (S.E.B.)

Nemesis [Gr. *νέμεσις*, from *νέμειν*, to distribute or allot]: Ger. *Nemesis*; Fr. *Némésis*; Ital. *nemisi*. In Greek thought, the principle of inevitable retribution according to the strict measure of desert; conceived at first impersonally, but later personified as a divinity.

Nemesis is distinguished from Fate, which in Greek thought has scarcely any moral significance. Nemesis is the vengeance which man brings upon himself by his own deeds. In this sense it corresponds to Karma in Hindu thought. There is no escape from Nemesis, however, whereas Hinduism points out a way of salvation. (A.T.O.)

Nemesis: see PATRISTIC PHILOSOPHY, (6), (c).

Neo- [Gr. *νέος*, new]: Ger. *Neo-*; Fr. *néo-*; Ital. *neo-*. New; as in neophobia, an abhorrence of anything new; neomania, a passion for novelty. (J.J.)

Neo-criticism: Ger. *Neo-Kriticismus*; Fr. *néocriticisme*; Ital. *neo-criticismo*. The revived KANTIANISM (q.v.) of the 19th century; theoretically equivalent to Neo-Kantianism, but as matter of fact used mainly for the form given to the Kantian thought in France by Renouvier, Pilon, and others. (J.D.)

Neo-Hegelianism: Ger. *Neuhegelismus*; Fr. *néo-hégélianisme*; Ital. *neo-Hegelianismo*. The revived Hegelianism of the school of thinkers represented in England by T. H. Green, J. and E. Caird, and Bosanquet, and in the United States by Morris, Harris, and Dewey.

The spirit of Hegel and the general outcome of his idealism are revived rather than the actual developments of his thought or his dialectical method. (J.M.B.)

Neo-Kantianism: Ger. *Neo-Kantian-*

ismus; Fr. *Néo-Kantisme*; Ital. *Neo-Kantianismo*. See KANTIANISM, and NEO-CRITICISM.

Neo-Lamarckism: see LAMARCKISM.

Neology [Gr. *néos*, new, + *lógos*, science]. Used in theology in a sense identical with RATIONALISM (q.v.). (A.T.O.)

Neophobia: see NEO-.

Neo-Platonism: Ger. *Neuplatonismus*; Fr. *néoplatonisme*; Ital. *neo-platonismo*. (1) The revival and transformation of Platonic philosophy that took place, with Alexandria as its head quarters, under the influence of oriental thought. Cf. Whittaker, *The Neo-Platonists* (1901). See PATRISTIC PHILOSOPHY (2), ALEXANDRIAN SCHOOL, and SOCRATICS (Plato).

(2) Also, the revival of Platonism that took place at Cambridge, England, in the 17th century, under the influence of Cudworth and Henry More. See CAMBRIDGE PLATONISTS. (J.D.)

Neo-Pythagoreanism: Ger. *neupythagoreische Lehre* (K.G.); Fr. *néo-Pitagoreisme*; Ital. *neo-pitagoreismo*. A system or, better, a tendency of thought which arose at Alexandria in the 1st century A.D., and which, in accordance with the tendency of the time, tried to consecrate its own teachings by identifying them with the teaching of some ancient sage.

It had its derivation from the latest period of the philosophy of Plato, in which the categories of the One, the Dyad, the Odd and Even, &c., were manipulated; and it emphasized the dualism of the Platonic metaphysic, transforming it into the basis of an ethical and religious asceticism. In connection with the latter it revived also the Pythagorean mysteries. It is of chief philosophic import because of its influence upon NEO-PLATONISM (q.v.) and, indirectly, upon Clement and Origen. Cf. PATRISTIC PHILOSOPHY. (J.D.)

Neo-vitalism: see LIFE.

Nerve [Lat. *nervus*]: see NERVOUS SYSTEM (III), and NERVE STIMULATION AND CONDUCTION.

Nerve-cell: see NERVOUS SYSTEM (II). Cf. NEUROCYTE, and NEURONE.

Nerve Stimulation and Conduction: (foreign equivalents are given under STIMULATION, and CONDUCTION). All nervous structures, whether fibres or cells, have normally the twofold property of reacting upon stimuli of suitable kinds (stimulation) and of propagating the peculiar form of molecular activity thus set up to adjacent or connected nerve elements (conduction).

It might be supposed that the cells would prove to be pre-eminently the excitable elements and the fibres the conducting members, but no such complete differentiation has taken place. Neither is it possible completely to distinguish these two processes one from the other, for the process of excitation is not different in kind from that which is propagated from one point to another in the system.

It is one of the commonest facts of nerve physiology that there is some peculiarity developed in the mature nerve-fibre which strongly tends to polarize its elements in such a way as to make more easy the passage of a stimulus in one direction than in the opposite one. It is not to be doubted that this peculiar resistance to translation of the stimulus or current the wrong way depends on some peculiarity of what is called molecular arrangement, and it is also more than probable that this structural organization is a function of the earliest activities of the axis cylinder which transform the before indifferent protoplasm into the forward-conducting nerve. The curious relation of this directive polarity of nerves to their original direction of growth is noted under NERVOUS SYSTEM (q.v., III). See also REGENERATION. The various experimental attempts to prove the power of nerves to conduct in the reverse direction suffer from the fact that all evidence shows that the union of an afferent and efferent nerve cannot take place without a regeneration of the axis cylinders beyond the lesion or point of attempted union.

In general it may be said that under favourable circumstances nearly all kinds of molar and molecular stimuli are capable of producing an effect on nervous matter. See PROTOPLASM, and LIVING MATTER.

One of the simplest means of experimental examination of the conductivity of nerves is that afforded by the so-called nerve-muscle apparatus, too well known to require description here. By varying the experiments with this apparatus it is possible to determine approximately the time required for a nerve-current to pass through a definite length of the nerve and numerous other data respecting the conductivity of the nerve. These experiments are all, of course, complicated by the fact that the current must produce a muscular contraction before a registration can be secured, and numerous variables may exist while the observer is attempting to measure one. By the use of various forms of electro-

meter nervous responses may be studied in terms of the electrical variation accompanying them. Here, too, the greatest caution is required in interpreting the results. While shock, thermal irritation, and chemical stimuli all produce nervous activity, the application of the various forms of electrical stimuli is so much more accurate and practicable that nearly all work in the study of nervous conduction is done by such means.

Du Bois-Reymond, who is the pioneer in the study of these phenomena, formulated in 1845 the statement that the excitory effect of a constant current is secured only by varying the intensity of the current; an unvarying constant current does not act as an exciter. The resistance offered by living nerve to the current is about the same as that of muscle. It is, in round numbers, 50,000,000, as great as that of copper wire, and 14.86 times that of distilled water. A current impinging on a nerve-fibre at right angles to the course of the nerve produces no effect, and the effect varies with the direction (ascending or descending), with the duration of the stimulus, the strength of the stimulus, and the length of the nerve through which it flows. The minimum time during which the current must be applied is apparently about .0015 of a second. When one electrode is placed at the equator and the other at the cut end of a nerve, the needle of a sensitive galvanometer indicates the passage of a so-called current of rest. But now, if an interrupted current be applied to the nerve, awakening its physiological activity, the needle of the galvanometer moves backward towards zero. This 'negative variation' may be produced by any stimulus that will set up a nervous action in the fibre. The electromotive force of a nerve is thus lessened by its physiological activity, and the amount of diminution finds its measure in the negative variation. The electrical condition of each excited place in a nerve-stretch is negative to all the places in the same nerve-fibre that are not excited. Du Bois-Reymond stated that the negative variation is not a continuous lessening, but a successive rise and fall of the current.

In his early experiments (1871) Bernstein made the following points: Between the moment of stimulation of a given point in a nerve and the onset of negative variation at a given distance in that nerve a measurable time elapses. The phenomena of negative variation have also a measurable duration.

The curve of negative variation rises abruptly to its maximum, but sinks more gradually. The rate of translation of the stimulus and that of the negative variation are identical. The duration of the negative variation was found to lie between .0006 and .0007 sec., the length of the wave being 18 mm., and the rate of translation 28 metres per second. With strong stimuli the negative variation may greatly exceed the nerve-current. The duration of a wave 10 mm. long in muscle is .004 sec., and the rate 3 to 4 metres. In nerves the wave remains more or less constant in its passage from the point of excitation, but in muscles, because of the transformation of molecular into molar motion, the intensity of negative variation diminishes.

In 1836 Peltier described a negative polarization in the legs of a frog through which a current was passing. Du Bois-Reymond found the point where the current entered alkaline, and that where it emerged acid. It then appeared that any porous body not too poor a conductor would, under similar circumstances, exhibit this negative polarization. Matteucci in 1860 independently described the phenomena of negative polarization and termed them secondary electromotor phenomena. In addition to the negative polarization, which at first does not seem to differ from that of other porous conducting bodies, but really is somehow connected with the vital activities of the tissue, there is a positive polarization which, so far as known, is confined to nerve, muscle, and electric organs. In monomeric muscles the polarization is stronger in the direction from the equator towards the extremities than in the opposite direction, a fact dependent on the direction of normal contraction. In motor and sensory nerves the positive polarization is greatest in the direction pursued by the normal innervation. In short, in all these cases of nerve, muscle, and electric organ the direction of maximum positive polarization is that pursued by the normal physiological activity.

The attempt to measure the relation of stimulus to nerve process remains practically abortive. Hermann found that, as measured by the resulting muscle contraction, the nerve process increases, at first rapidly, and then more slowly with the increase of the stimulus. Fick sought to prove that within certain limits the relation is that of a direct proportion. There are successive maxima with intervening diminutions. Rutherford discovered that the reflex effects of stimulating

a sensory nerve are greater when the stimulus is applied near the central organ than when further removed. The speed of conduction is, as already mentioned, about 28 metres per second in the frog, while for man it is about 33.9 metres. Hirsch found the rate in sensory nerves of man 111.5 feet per second, a result more closely agreeing with the results of Helmholtz's experiments than even those of other investigators on the rate of passage in motor nerves.

Variations in temperature and in the vital condition of the nerve affect the rate of translation, as might be expected.

Kries found that the excitatory impulse of nerve on muscle is not uniform, but is subject to great variation, so that the negative variation may be much longer than that produced after instantaneous irritation, as found by Bernstein ($\frac{1}{250}$ sec.). In the frog muscle eight shocks per second produce tetanus, while in mammals a much greater number of shocks from the induction apparatus is required to produce tetanus. Loven supposed that the final result of physiological stimulation lasts much longer than that from induction shocks, and that electrical stimulation occupies an intermediate position.

Among the many causes of ambiguity attending the use of electrical stimuli in the attempt to trace the paths of normal nervous conduction and in the investigation of the laws of such action, is the occurrence from time to time of what Sherrington calls 'antidrome conduction'; that is, the conduction of electrical effects backward or in a direction contrary to the course of the normal nervous stimulus. After transection of the cerebro-spinal axis at the calamus, if the funiculus gracilis be excited by a minimal current conveyed by steel needles, movement is evoked in the hind legs of the same side, and, in like manner, excitation of the funiculus cuneatus produces motion in the corresponding fore-leg. These reactions occur even after isolation of the funiculi from the ventro-lateral structures in the medulla oblongata for a distance of 3 cm., so that the reactions are not due to the escape of current to descending tracts in the medulla. Moreover, transection of the ventro-lateral columns below does not prevent these results, while section of the dorsal columns does. Section of the dorsal roots of the regions contracting will obliterate or nearly destroy the reaction. It may be suggested that the several links of the chain of conduction are polarized, and each then

acts as an irritant to the one below it, so that in effect a retrograde current is set up. These facts warrant hesitation in accepting the results of electrical stimulation as *ipso facto* identical with those of nervous excitement.

The use of the galvanometric method for localization dates from Caton, who employed it in researches made public in 1875 and 1887. By connecting points on the external surface of the cortex with the galvanometer, he found that the uninjured surface is usually positive to a section of the cortex, but that when a part of the cortex under investigation was thrown into activity a negative variation was produced. Setschenow applied a similar method to the medulla oblongata and noticed periodic variations in the resting electrical difference which he attributed to periodic changes in the functional activity of the medullary centres. Gotch and Horsley, whose researches are important in this department, began their work in 1888. About the same time A. Beck, of Cracow, and Fleischel were carrying on similar investigations. The results of the work of Gotch and Horsley may be summarized as follows: the resting electrical difference between the cut and uninjured surface was found to be, in the nerve .01 Daniel, for the root .025, and for the cord .032 (in the cat), while the figures are somewhat lower for the monkey.

These values are at once lowered in some conditions, while the difference in the cord is increased after the functional activity of that organ has been aroused. The difference is also greater if the connection with the brain is unbroken. Excitatory electrical effects can be noticed in the cord as a result of the stimulation of the cortex cerebri. This excitatory state evoked by stimulation of the cortex suffers a diminution of over 80 per cent. in passing from the cord to the sciatic nerve. A marked degree of localization can be demonstrated in the spinal cord by irritating various cortical areas. The effect in the cord after irritating the corona radiata is little more than half that produced by similar irritation of the cortex, and the cord effect is four times as great as that in the nerve. While in cortex stimulating the normal condition seems to be one of unilateral discharge, the circumstances that favour the production of bilateral effects are such as bring into play the opposite cortex, cerebellum, basal structures, &c. The bilateral effects are more readily evoked by means of stimulation of the corona radiata. Indirect as well

as direct channels exist in the cord. In the monkey a larger number of direct fibres are contained in the lateral column than in the dorsal column, the reverse being the case in the cat. No evidence was obtained of crossing between the lateral columns, but evidence of a direct connection between one dorsal column and the lateral column of the same side and of a cross connection between the dorsal columns. There is no evidence of any continuous fibres in the ventral columns of the cord between the mid-dorsal and the lumbar regions in the monkey. By far the majority of afferent impulses ascend the cord on the same side as the entering root, and a small minority ascend by the dorsal column of the opposite side, while a very few ascend by the lateral column of the opposite side. The direct path of afferent impulses is located in the dorsal column of the side of the root excited. The indirect paths are in the dorsal columns of both sides and the lateral column of the side excited.

On minimal excitation of the dorsal column, impulses are freely transmitted to the dorsal roots of the same side and so into the mixed nerve. With maximal excitations the impulses are similarly transmitted through the indirect paths. On maximal excitation of the dorsal column, impulses are transmitted by indirect paths across to the dorsal roots of the opposite side. On excitation of the lateral column, impulses are directly transmitted to the mixed nerve of the same side. There is a complete obstruction to all centripetal impulses that may reach the cord by the central end of the ventral roots. A marked quantitative diminution as well as delay in time is suffered by impulses which leave the spinal cord by the ventral roots.

Nervous Disease: see NEUROSIS, and the various special names of nervous disorders. Cf. PSYCHOSIS, and PATHOLOGY (mental).

Nervous System: Ger. *Nervensystem*; Fr. *système nerveux*; Ital. *sistema nervoso*. The totality of the excitatory and responsive organs of an animal body, including all structures serving to receive, transmit, co-ordinate, and respond to external or internal stimuli or to form the initiative for voluntary functions.

NERVOUS SYSTEM

[Treatment.—This article comprises the following sections: I. Comparative Anatomy and Phylogeny. II. Histology and Histogenesis. III. Structure, including Nerves, Cranial Nerves, Spinal Nerves, and Sympathetic System; together with bibliographies appended to the various sections.]

I. *Comparative Anatomy and Phylogeny.* In the Protozoa there is no differentiated nervous system, the fundamental nervous function—IRRITABILITY (q. v.)—being diffuse. In Sponges, though they are little more than colonies of protozoans, a few instances (*Dendrilla*, &c.) are known where definitive nerve-cells and sense-organs occur. In Coelenterata for the first time a well-developed nervous system appears, though the nervous function is not entirely concentrated within it. Especially interesting are the variations in the nervous

ganglion gives off a number of fibres supplying the muscles, skin, and sense-organs of that segment. Especially characteristic of annulates are the so-called neurochord fibres arising in the cephalic ganglia and passing through the entire length of the cord. They spring from giant nerve-cells, and resemble the similar bodies in the spinal cord of fishes. The arthropods elaborate the neural plan laid down in the Vermes.

The brains of lower vertebrates not only serve as simplified diagrams to explain the complex structure of the human brain, but afford hints as to the course pursued in its evolution. In *Amphioxus* we have at once the lowest existing type and a degenerate condition of the vertebrate nervous system. See Plate A (NERVOUS SYSTEM), Fig. 1. Here the cephalic portion of the nerve-tube is expanded, and indications of the three embryonic vesicles appear. The first of these forms a ventricle provided with an infundibulum connected with the olfactory apparatus. In the *Petromyzontidae* a marked advance upon the condition just described is reached. Here rudimentary hemispheres are developed, though they seem to be almost wholly concerned with data from the olfactory sense. The dorsal system of sense-organs (epiphysial system) is remarkably developed, suggesting a probable functional condition prior to the differentiation of lateral eyes. See PARIETAL ORGAN. The brain of selachians differs from that of higher vertebrates, in that no true lateral ventricles are formed. The lung fishes, although deviating less from the main line of evolution, are in some respects higher than sharks. The ganoids are still more specialized, forming a transition to the bony fishes. The cephalic end of the brain-tube connects with the ectoderm in an embryonic period, and the neuropore so formed is closely related with the rudiment of the hypophysis. In spite of great diversity otherwise, all bony fishes agree in lacking the cortex cerebri, and such nervous elements as substitute for that structure remain in the axial lobe. A dorsal membranous pallium covers the ventricles and aulla, and includes the representatives of the plexus. The roof of the aulla is distended to form a large dorsal sac. The infundibular region is also distended to form a saccus vasculosus near the mammillary bodies. Enormous massive protuberances from the pes pedunculi region constitute the hypoaria. The cerebellum is enormously developed, and a special portion, or volvula, is

system in different individuals of the colonies of Hydroids, consisting of nutritive individuals, blastostyles, and medusae. See Fig. 1.

In the flat worms (*Planaria*) the nervous system has completed its separation from the external epithelium, and a certain degree of concentration is evidenced by the formation of a ganglion above the oesophagus, and the localization of two among the many radial trunks to correspond with a bilateral symmetry in the body. In higher groups of Vermes the simple scheme outlined in *Planaria* undergoes infinite variation, until, in the Annulata, the ventral double chain is segmented to correspond with the jointed body. Each ventral

thrust into the unobliterated cavity of the mesencephalon. In addition to the cerebellum, other outgrowths from the medulla usurp positions in its roof, and these depend on the preponderance of one or another of the cranial nerve nuclei.

In amphibians the various regions of the brain depart very little from the primitive and embryological conditions. In the tailed forms especially the arrangement of the cells is essentially similar in the various segments, and the functional representatives of the several nuclei are scarcely segregated, but occupy the primitive position near the ventricles. Nevertheless in the Amphibia and reptiles distinct cortical centres develop, especially those for construing olfactory stimuli. Reptiles may be said to represent the middle point in the development of the brain. The functional persistence of the parietal eye is an important feature in some lizards. In birds the most noteworthy features are the excessive compactness and the emphasis on all parts connected with vision and locomotion. The relative size and configuration of the hemispheres has been successfully used in classification of the minor groups.

In all these groups a common structural plan appears in the midst of conflicting tendencies (cf. BRAIN). The figures from Burckhardt (Plate A, Nervous System) may serve instead of further verbal comparisons.

summaries of the more important papers in Comparative Neurology.

II. *Histology and Histogenesis.* The essential functional element of the nervous system is the nerve-cell (neurone or neurocyte) with its various appendages (see Fig. 2).

The nerve-fibre is simply a process or prolongation of the neurocyte or the product of the fusion of a number of such elements. A typical neurocyte consists of a cell-body, containing nucleus, nucleoli, pigmented and unpigmented protoplasm, and giving off at least two varieties of processes. One of these, which is usually the conveyer of cellifugal stimuli, is the neurite, 'axon,' or 'axis-cylinder process'; the others, usually more ramose, and conveyers of cellipetal stimuli, are the dendrites, or 'protoplasmic processes.' When a neurite soon breaks up without extending far from its origin, it is termed a neuropodium.

Fig. 2. A nerve-cell. (From Nansen.) *m.p.*, mixed process, or neurite; *pp*, dendrites; *v*, transected tubules; *cm*, cell sheath; *a*, cavity between sheath and cell filled with reticular stroma.

When a cell has but a single variety of processes it is called homoipodal, as contrasted to heteropodal. The ganglion cells, e.g. of the spinal ganglia, are illustrations of homoipodal nerve-cells. In these cases the cellifugal and cellipetal processes have fused for a certain distance from the cell-body. The specific cells of the olfactory sensory organs afford good illustrations of unipolar cells, though it must be remembered that, in this case, the term is used in a morphological, not a physiological sense.

Some cells of the sympathetic ganglia form a peculiar type of unipolar neurocyte, in which the cell gives rise to a non-medullated fibre, and its body is surrounded by a dense network derived from a distinct fibre (Figs. 14 and 15). Heteropodal neurocytes are more generally distributed, forming the majority of functional nervous elements. Two main classes are distinguished: viz. type I, in

which the neurite passes without interruption into a nerve-fibre, and type II, in which the neurite almost immediately subdivides in arborizations. Type I is best seen in the motor regions of the spinal cord. Type II is seen in sensory regions of the cortex, in the cerebellum, and in the retina.

Under most circumstances neurocytes are serially independent anatomically, i.e. do not actually come into contact with each other, thus insuring a certain insulation and rendering possible—it may be conjectured—a 'threshold' of discharge or an initial resistance. Cf. *CONCATENATION* (neural). In certain cases it would seem that there is lateral continuity among processes of cells of

Fig. 3. Portion of the mesencephalon of garter snake embryo. Neuroblastic nuclei in division near the ventricle; spongioblasts, some of which are also dividing; older neuroblast near the surface.

the same order (Dogiel). So in the retina and sensory elements of the skin, especially of the external genitalia. The perikaryon or cell-body and the neurite or fibre taken together make up the neural unit of structure called the *NEURONE* (q. v.), or neurocyte.

The method of development of the nervous elements is remarkably constant. The neuro-epithelium of central or peripheral areas is at first composed of a single layer. At a very early period two classes of elements (neuroblasts and spongioblasts) are differentiated, the former passing through a variety of changes of form and position until prepared to function as adult nerve-cells, the latter remaining to constitute a portion of the framework of the structure. The neuroblasts

and spongioblasts both retain the power of subdivision for some time, providing for growth by proliferation. In many portions of the central nervous system special groups of neuroblasts are formed, which serve as germinative or proliferating nuclei. In other cases, as in that of the olives and cerebellum, the neuro-epithelium itself forms invaginated or evaginated pouches, whence proliferating elements take their origin for the upbuilding of an organ. In the cerebellum, at an early stage, a transitory layer of neuroblasts is thus formed upon the ectal surface, from which the deeper layers are formed by a species of cell migration. See Figs. 3, 4, 5.

The same process occurs elsewhere in the brain, and it is probable that cells capable of proliferation are present as reserves up to a late period.

The simplest form of connection between peripheral and central elements found among vertebrates is illustrated by the olfactory connections (Fig. 6). The receptive cell (*o*) transmits its impulse along the neurite (*n'*) to the olfactory glomerule (*gl.*) in the olfactory bulb. Here it passes over into the second nerve-unit, and thence via the neurite (*n''*) to the olfactory centres of the cortex. A more highly differentiated condition is found in the sensory nerves of the skin. See *SPINAL CORD*, Figs. 2 and 4. Here the cell-body of the first neurocyte has been removed from the surface to the spinal ganglion, and the central termini are much more complicated. These instances may be taken as typical intercellular relations.

III. Structure:

A. Central Nervous System. See BRAIN, and SPINAL CORD.

B. Peripheral Nervous System.

1. Dermal and Special Sense Organs. See SENSE ORGANS.

2. Nerves.

Nerve: a bundle of nerve-fibres, together with the sheaths and connectives. Each nerve-fibre is an outgrowth of some neurocyte or ganglion cell or the product of fusion of a moniliform series of such outgrowths. See CONCATENATION.

The essential portion of each nerve-fibre is the axis cylinder, a slender protoplasmic cord composed of a denser fibrillary framework and a semi-gelatinous stroma. The axis cylinder

is simply the extreme development of a process from a nerve-cell. As it leaves the parent cell the axis cylinder is naked, but it may soon become clothed with a medullary sheath, and as it leaves the central system it acquires the dense homogeneous sheath of Schwann. At the terminus of each nerve the sheath is again lost, and the naked axis cylinder comes in contact with the end-organ. The sheaths serve the double purpose of insulation and protection. Non-medullated nerves occur chiefly in the sympathetic system of mammals, but are more widely distributed in lower types. The non-medullated condition is the primitive one, and occurs in nearly all nerves of invertebrates and the lowest vertebrates (*Amphioxus* and *Cyclostomata*).

Each medullated nerve-fibre is divided into segments, each of which has its own nucleus (Ranvier's nodes). Phenomena of regeneration and development seem to indicate (contrary, however, to the statements of Kölliker) that each node represents a nervous element or cell, whose protoplasmic outgrowth (axis cylinder) has united with its neighbour in both directions. When the fibre is separated from its trophic centre, these nuclei proliferate and regenerate the fibre, supplying local trophic centres until the connection is re-established. The nodes also appear prior to or in the absence of the sheath of Schwann. A second obscure fragmentation of the myelin sheath gives rise to the Schmidt-Lantermann incisions, but these are probably artifacts.

Each nerve bundle is held together by an intrinsic connective system (endoneurium), and each bundle is covered by its epineurium. The sheath of the nerve as a whole constitutes its perineurium. See Fig. 12.

Motor nerve-fibres arise from neurocytes within the neuraxis and are thus prolongations of their neurites. Sensory fibres arise from the dendrites of the ganglion cells of the spinal or cranial ganglia, while the neurites of the latter enter the neuraxis, there to arborize about the cells of the terminal nuclei. The growth in each case pursues the direction of the normal nervous transmission. Cf. WALLER'S LAW.

To the law that nerves conduct only in the direction of original growth there are exceptions, as in the case of the peripheral process of the spinal ganglion cells and as in cases where a sensory nerve has been grafted upon a motor trunk, and vice versa. The latter cases are probably to be explained on the supposition that the peripheral portion under-

NERVOUS SYSTEM

goes the characteristic DEGENERATION (q. v.), and, in regenerating, assumes the required properties.

Nerves are acted upon by mechanical, thermal, chemical, and electrical stimuli, though it is probable that each such irritant is converted into a common type of stimulus before it is translated through the nerve substance. The nature of the physiological or normal stimulus is still unknown (cf. END-ORGAN). The degree of excitability is largely

also Figs. 8, 9. Among the muscle-fibres a few of smaller size are found, usually in groups of several together, enclosed in a special connective-tissue sheath. The muscle-spindle, as such special muscle bundles are termed, is undoubtedly a sensory organ, and its fibres are supplied by nerve-fibres, which arise from the dorsal roots of the spinal nerves. Their peculiar spiral endings are shown in Fig. 7. The tendon is supplied with a special end-organ consisting of

dependent on the nutrition or the metabolic state. That which is frequently included under the term temperament (largely metabolic predisposition) probably has much influence.

The termini of motor nerve-fibres upon the muscle assume a variety of forms. The naked axis cylinder frequently branches extensively at its extremity, and even where definite end-plates are formed (Fig. 10), proper methods demonstrate similar ramifications among the nuclei (Fig. 11), which correspond to the terminal arborization of the motor nerve. See

numerous fine branches. For the relations of the nerve roots see SPINAL CORD.

Cranial Nerves. The first twelve pairs of nerves leaving the central nervous system, and in higher vertebrates all emerging through special foramina in the skull. The last cranial nerves resemble the spinal nerves. This resemblance diminishes as we pass cephalad, yet there is little doubt that all cranial nerves have been differentiated from a similar primitive condition. There is, however, as yet no agreement as to the number of primitive segmental nerves represented in the head.

The current numerical designations, as given below (those of Sömmering, 1778), are highly unsatisfactory, though a better system has not yet been developed. The basis for a more philosophical classification is to be sought in the study of the components of the several nerves as determined by their central connections and peripheral distribution. All nerves arising from the same or homologous centres, and distributing to homologous peripheral organs, may be regarded as constituting a single system. In higher vertebrates, at least, there is no nerve which contains all of the components, and it is not necessary to assume that they were all contained in the primitive segmental nerve.

Gaskell has made an analysis of the nerves, in which he distinguishes five groups. His system is very suggestive, and affords a basis for further research. The reader is referred to his papers for the details (see the works cited below). Its most valuable feature is the analysis of the motor cranial nerve-nuclei into somatic (XII, VI, IV, III) and visceral (XI, X, IX, VII, V), a distinction based on structural, physiological, and embryological data (cf. *Spinal Nerves*, below). A more sure basis for the components has been laid, however, by their study in the lower vertebrates. They have been already worked out for some of the amphibians and fishes (O. S. Strong, 1895, et al.). The following systems of components are known in these forms, and there are probably others: (1) The general cuta-

neous system (corresponding to Gaskell's somatic sensory, in part). Sensory fibres carrying tactile and other general sensory impressions from the skin to the brain and terminating in the spinal trigeminal tract, which is the continuation into the medulla of the dorsal cornua of the spinal cord. The spinal trigeminus is not only a tract of fibres, but it contains cells scattered through it. These cells constitute the upper and lower sensory nuclei of the trigeminus. In the trunk this component is undoubtedly represented by most of the fibres of the dorsal roots of the spinal nerves. (2) The communis system. Sensory fibres carrying certain visceral and other special sensations (taste, &c.), often from more or less highly specialized organs (end-buds), and passing by way of the fasciculus communis of the medulla oblongata (fasc. solitarius of man) to the chief vagus nucleus or its equivalents (lobus facialis and lobus vagi of fishes). (3) The acustico-lateral system. Sensory fibres from the neuromasts, or sensory organs of the lateral line canals of fishes, and from the organs of the internal ear, which have probably been derived from the lateral line organs. In higher (amniote) vertebrates this system is represented only by the auditory nerve. The fibres pass into the tuberculum acusticum of the medulla, a cluster of cells which, in lower forms at least, is intimately related to the cerebellum. It lies further dorsally than any of the other systems, and, unlike the general cutaneous, it seems to have no homologue in the spinal cord. Finally, the motor systems. Of these there are probably at least two, innervating (4) the somatic or body muscles, and (5) the visceral muscles respectively. They arise from the motor nuclei of the medulla. The fourth system is derived from the ventral cornua of the spinal cord or the cranial nuclei corresponding to them; the fifth probably from the lateral cornu or its equivalents in the medulla. The olfactory and optic nerves cannot as yet be placed in any of these groups. In man the same general relations of components undoubtedly prevail, though with great variation in the details, the chief difference being the absence of the acustico-lateral component in the VII and X nerves, correlated with the loss of the lateral line organs. The accompanying figure (13) illustrates their relations, so far as known, in fishes and amphibians. The XI and XII nerves in these forms are not completely differentiated.

I. *Olfactory Nerve.* The specific nerve

of smell. It exhibits numerous important differences from the other cranial nerves, especially in that its fibres lack the medullary sheath, and are in direct protoplasmic continuity with their peripheral receptive organs, the sensory cells of the olfactory epithelium. A further difference from other sensory nerves is the apparent lack of a root ganglion. It has been suggested that this ganglion is represented by the olfactory cells of the nasal membrane, which have retained the primitive position in the skin in which they are found in some invertebrates. Centrally, the olfactory fibres break up into terminal arborizations in the glomerulae of the olfactory lobe, and here connect with other systems of fibres, which bring the glomerulae into relation with the cortical centres for smell in the hippocampal regions (see Fig. 6).

II. *Optic Nerve.* The nerve to the lateral functional eyes of vertebrates. (For parietal

Fig. 13. Schema of the components of the cranial nerves of fishes. The somatic-motor and visceromotor systems (see above) are not separately designated.

nerve to the median eye see **PARIETAL ORGAN**, and **EPIPHYSIS**.) The peculiar relations of the retina to the brain give to the optic nerve a very special significance. In fact, it is not a nerve at all, in the strict sense of the term. The protods of the eyes having developed on the cephalic plate of the embryo before the closure of the medullary tube, they, together with the corresponding ganglia, are included by the invagination of the cephalic plate, and come to lie in the walls of the primary fore-brain. This is their permanent position in the ascidians and Amphioxus, but in craniate vertebrates end-organs and ganglia are evaginated to form the optic vesicle from which the retina ultimately develops. The embryonic optic nerve is at first a tubular prolongation of the first cerebral vesicle. The optic fibres grow into it at a later period. Throughout

life, in certain amphibia, it retains its lumen and spongioblastic framework like the brain proper. The cells of the third, or ganglionic, layer of the retina represent, perhaps, the root ganglion. From these cells most of the optic fibres arise and grow towards the brain, though a smaller number seem to grow in the opposite direction from brain to retina, there ending in free arborizations in the deeper retinal layers. These latter fibres probably transmit impulses centrifugally to the retina. In animals with eyes so placed that the field of vision of one eye does not overlap that of the other eye, the optic nerves cross completely in the chiasma before entering the brain. In other cases, as in man, fibres from that portion of the retina whose impressions come from objects on the opposite side of the body do not, like the other fibres, cross in the chiasma. In the lower vertebrates the fibres of the optic nerve pursue a perfectly simple course through the chiasma and optic tracts to end in the superficial layers of the tectum opticum. Those fibres which end free in the retina arise from cells which lie in the tectum. Connections with the cerebrum are effected by means of the brachia, corpus geniculatum, and optic radiations. In mammals the general plan is the same, though complicated by connections of the optic tracts with the corpus geniculatum externum and the pulvinar, as well as with the tectum.

III. *Oculomotor Nerve.* The motor nerve for the rectus superior, rectus inferior, rectus internus, and obliquus inferior muscles of the eye. Its nucleus of origin lies in the floor of the aqueduct of Sylvius. Its fibres run to the ventral surface of the brain and emerge on the mesal aspect of the crus cerebri. They are chiefly motor, though Sherrington has shown that both the III and IV roots also contain sensory fibres which serve the 'muscle sense.' Peripherally they come into relation with the ciliary ganglion and the sensory fibres of the trigeminus and sympathetic.

IV. *Trochlear or Pathetic Nerve.* The motor nerve to the superior oblique muscle of the eye. Its nucleus of origin lies in the floor of the aqueduct immediately behind that of the oculomotor. The fibres take a dorsal course and cross in the brain roof (the valvula) just cephalad of the cerebellum.

V. *Trigeminal or Trifacial Nerve.* The largest of the cranial nerves. It supplies the muscles of mastication and the general sense-organs of the face and teeth. It arises by two roots. The portio minor, or motor root, springs

from two groups of cells, one lying dorsally of the exit of the nerve from the medulla oblongata. A smaller number of fibres arise in an elongated cluster of large cells arranged sparsely along the side of the aqueduct, and constitute the descending, or mesencephalic, root. The portio major is a complex structure, chiefly sensory. Most of the fibres go to the spinal trigeminal tract and terminate in cells lying in its path (including the 'chief sensory nucleus of the trigeminus'), and are, therefore, homologous with those of the dorsal roots of the spinal nerves. These supply the general cutaneous sense organs of the face (first component). Other fibres are said to enter the cerebellum. The fibres of the portio major before leaving the cranium enter the Gasserian ganglion, of whose cells they are the neurites and from which they emerge in three branches, the ophthalmic, maxillary, and mandibular rami. The fibres of the portio minor pass by the Gasserian ganglion and enter the mandibular nerve. The ophthalmic nerve (exclusively sensory) sends small filaments to the third, fourth, and sixth nerves, to the ciliary ganglion, and from the latter to the ciliary nerves of the eye. The remaining fibres distribute to the dura mater, nose, eyelids, and skin of the forehead. The maxillary nerve also communicates with a small ganglion, the sphenopalatine, and supplies the integument of the side of the face, the upper teeth, and parts of the lining membranes of the nose and mouth. The mandibular nerve communicates with the submaxillary and the otic ganglia, and sends motor branches to the muscles of mastication, and sensory branches to the lower part of the face, to the tongue, mucous membrane of mouth, lower teeth, salivary glands, &c.

VI. *Abducens Nerve*. This purely motor nerve arises from a nucleus in the floor of the fourth ventricle, and passes ventrally to its superficial origin on the caudal edge of the pons. It innervates the external rectus muscle of the eyeball.

VII. *Facial Nerve*. A mixed nerve, arising in two portions. Most of the fibres are motor, and come from a nucleus lying ventrally and slightly caudally of that of the sixth nerve. The fibres curve around the latter, forming the genu of the facial, then directly ventrad in a compact bundle. After emergence from the brain they are joined by the much smaller portio intermedia from the fasciculus solitarius (or fasc. communis—second component). These are sensory fibres and are provided with a

ganglion (geniculate g.). They communicate by means of the chorda tympani with the submaxillary ganglion and the lingual nerve of the trigeminus, and supply taste-buds of the tip of the tongue. The larger (motor) component of the seventh nerve supplies the muscles of expression of the face. The facial nerve is said by Edinger to receive some general cutaneous fibres from the first component (spinal V tract). In fishes and amphibians the seventh nerve receives also a large contingent from the acustico-lateral system.

The cortical connections of the third to seventh nerves are not thoroughly understood. There is, however, abundant evidence that the sensory components are all in more or less direct connection with the fillet (and hence with all the higher sensory centres), and the motor with the pyramids.

VIII. *Auditory or Acoustic Nerve*. Our knowledge of this nerve is in a most unsatisfactory state. The anatomical and functional relations of the several roots in man are still largely matters of controversy. In lower vertebrates the auditory nerves and the nerves of the lateral line terminate together in the tuberculum acusticum (see Fig. 13). In terrestrial amphibians (frog) the lateral line system disappears, and the auditory fibres end in two groups of cells lying dorsally of the superficial origin of the nerve, the tuberculum acusticum. The intimate relation of the auditory to the lateral line nerve is not confined to their central connections; but the membranous ear is probably a more highly specialized portion of the original lateral line canal system. The eighth nerve has two branches, the ventral, or vestibular, and the dorsal, or cochlear. The vestibular ramus supplies the macula acustica utriculi and the superior and external ampullary organs, and carries a ganglion (vestibular g.). The cochlear ramus supplies the macula sacculi, the posterior ampullary organ, and the cochlea. It, too, bears a ganglion (spiral ganglion). The two rami remain distinct to their terminal nuclei in the medulla, the vestibular ramus passing, for the most part, directly to a dorsal nucleus in the floor of the fourth ventricle, and the cochlear ramus into the ventral cochlear nucleus. Some fibres pass through this nucleus, externally and dorsally of the restiform body, to form the striae medullares in the floor of the fourth ventricle; others along the ventral wall of the medulla (trapezoid body) to the superior olives. The

fibres of the cochlear ramus enter by devious courses into relations with the lateral lemniscus, and through the latter with the post-geminum, geniculatum mediale, and temporal lobe of the cerebral cortex. The vestibular ramus communicates directly with the cerebellum. In man the dorsal (cochlear) ramus is clearly the one chiefly concerned with audition. In the lower vertebrates there is no anatomical evidence that the utricular ramus differs in any way from the saccular. The vestibular fibres are regarded by many as serving the function of equilibration rather than audition.

IX. Glossopharyngeal Nerve. This nerve is intimately related to the tenth. It contains three elements: viz. (1) sensory fibres of taste, terminating among small cells in the dorsal part of the medulla, and distributing peripherally to the mucous membrane and circumvallate papillae of the back part of the tongue (second component); (2) general sensory fibres (first component); (3) finally, certain fibres arise from a motor nucleus—the nucleus ambiguus—lying on the ventral side of the sensory nucleus. These fibres innervate the stylopharyngeus muscle, and perhaps some of the constrictors of the pharynx (fifth component). Besides the lingual and motor branches above referred to, there are a tympanic branch to the middle ear, several pharyngeal branches, and anastomoses with the V, VII, X, and sympathetic nerves.

X. Vagus or Pneumogastric Nerve. The motor and sensory nuclei of the tenth nerve are scarcely distinguishable from the corresponding nuclei of the ninth. The size of the first (general cutaneous) component varies greatly in different animals. In fishes and amphibians there is also a large root entering the vagus from the tuberculum acusticum which supplies the organs of the lateral line of the trunk. In man the vagus communicates with the VII, IX, XI, XII, 1st and 2nd spinal, and the sympathetic. Its distribution is very wide, comprising branches to the dura mater, external ear, pharynx, larynx, heart, lungs, stomach, and other viscera. Throughout its entire extent the vagus is in frequent communication with the sympathetic, and it seems to share many of its functions with the latter. It controls, more or less directly, the more important automatic and vegetative functions of the body, such as circulation and digestion, and is thus of the most profound physiological significance.

XI. Spinal Accessory Nerve. The eleventh

nerve consists of two parts: (1) The vagal portion is really detached filaments of the vagus, containing inhibitory fibres for the heart, motor fibres for the pharynx, &c. (2) The spinal portion arises from the lateral aspect of the spinal cord as far back as the fifth or sixth cervical vertebra in numerous separate strands. The fibres are motor, and arise from the lateral cornu of the cord. They turn cephalad, and are collected into a single trunk and emerge through the same foramen as the vagus. They supply the sterno-mastoid and trapezius muscles.

XII. The hypoglossal nerve arises from a large nucleus lying ventro-laterally of the central canal and chiefly below the fourth ventricle. The fibres are motor, and innervate the muscles of the tongue chiefly.

Literature: for further anatomical details consult the general works referred to under BRAIN, especially QUAIN'S *Anatomy* (10th ed.), iii. Pt. II, and *Handatlas der sensiblen und motorischen Gebiete der Hirn- und Rückenmarksnerven*, by C. HASSE, Wiesbaden (1895). For a general critical summary of all that has been written on the comparative anatomy of the cranial nerves, and especially on the relation between cranial and spinal nerves, see MAX FÜRBRINGER, *Ueber die spino-occipitalen Nerven d. Selachier u. Holocephalen u. ihre vergl. Morphol.* (1897). On the components the following will be found useful: OLIVER S. STRONG, *J. of Morphol.*, x. 1 (1895); B. F. KINGSBURY, *J. of Compar. Neurol.*, vii. 1 (1897); C. JUDSON HERRICK, *J. of Compar. Neurol.*, ix, and *Arch. of Neurol. and Psychopathol.*, ii (1899); W. H. GASKELL, *J. of Physiol.*, vii, x; VON KUFFER, *Merkel und Bonnet's Ergeb.*, 562-618 (1896). On sensory fibres of the eye-muscle nerves see C. S. SHERRINGTON, *Proc. Roy. Soc. London*, lxi, No. 373, p. 247 (1897); G. C. HUBER, 'Atypical Motor Endings' of Retzius, *Anat. Anz.*, xv (1899); and *J. of Compar. Neurol.*, x. 2 (1900).

Spinal Nerves. There are in man thirty-one pairs of spinal nerves. Each pair, except the first, is named after the vertebra below which it emerges; thus we have eight cervical, twelve thoracic, five lumbar, five sacral, and a coccygeal nerve. Each spinal nerve arises by two roots from the SPINAL CORD (q. v.), of which the dorsal (sensory) is ganglionated. The ventral (motor) joins the ganglion, but merely to pass through it. Beyond the ganglion the mixed trunk divides into a small dorsal and a larger ventral

NERVOUS SYSTEM

ramus, each containing both sensory and motor fibres. At each segment there is a communication with the sympathetic ganglion of this segment.

It was formerly held that the spinal nerves contain but two components—motor and sensory; but there is rapidly increasing evidence for separating the visceral nerves (efferent and afferent) from the somatic. We should therefore distinguish four kinds of fibres in each segmental nerve: (1) somatic afferent, sensory nerves from the skin; (2) somatic efferent, motor nerves for the voluntary, or skeletal muscles; (3) visceral afferent, nerves of 'general sensation,' &c.; (4) visceral efferent, supplying the involuntary muscles. The visceral systems are related to the lateral cornu and Clarke's column of the spinal cord. In the head these components are obscured, and, possibly, in part, supplanted by others; and it is not at present possible to establish sure homologies.

The table on the next page, from Edinger (based on Starr), exhibits the regional distribution from the various segments.

Literature: see the papers by GASKELL, cited under *Cranial Nerves* above, and QUAIN'S *Anatomy* (10th ed.), iii. Pt. II. 381-91 (with literature). For the courses of the several spinal nerves consult the textbooks of human anatomy already cited.

Sympathetic System. More properly, 'Sympathic System.' The sympathetic or visceral, as distinguished from the cerebro-spinal nervous system, is primarily concerned with the vegetative functions. It consists of a double series of ganglia connected *inter se* and with the spinal ganglia, as well as with terminal ganglia adjacent to or imbedded in the visceral tissues.

The ganglia of the great sympathetic chain (truncus sympathicus) are segmentally arranged, and each communicates with the corresponding spinal ganglion. The commissural fibres are of two kinds: (1) white (medullated), arising from the medulla oblongata by both dorsal and ventral roots, and terminating in the sympathetic ganglia or passing through into the sympathetic rami. They are both efferent and afferent. (2) Gray (non-medullated). They arise in the ganglion cells of the sympathetic chain and join the spinal nerve just beyond the spinal ganglion. Some fibres turn peripherally into the spinal nerve; others terminate in the spinal ganglion around the bodies of the ganglion cells; others pass into the dorsal spinal roots and

end in the sheath of that nerve, the dura mater, and the tissues adjacent, without entering the brain.

In the cervical and cephalic region the symmetry of this arrangement is disturbed, and the sympathetic fibres are bound up with the cranial nerves in the most complicated manner. In the abdominal cavity large ganglionic plexuses lie adjacent to the viscera. Of these the most important are: (1) the cardiac plexus, lying against the aorta and pulmonary artery. It receives fibres from the tenth cranial nerve. (2) The solar, or epigastric plexus, in the upper part of the abdomen, behind the stomach, is the largest. It communicates freely with the whole visceral innervation, and with several smaller secondary plexuses.

The vaso-motor nerves arise in the central system, but lose their sheaths in the sympathetic ganglia, and are thence distributed to the blood-vessels. See VASO-MOTOR NERVES.

Some sympathetic functions are independent of central innervation; such are the automatic ganglia of the heart, and the plexuses of the intestine and uterus. Others are more or less indirectly or incompletely under central control. Among the important sympathetic functions are, pupil reflexes, secretion, perspiration, digestion, and nutrition.

Conflicting views exist as to the origin of this system. Paterson claims that, so far from being derived from the central system, it is not even of ectodermal origin, but arises as an unsegmented mesoblastic cord. It is, however, more commonly regarded as an offshoot from the central system, and the evidence is in favour of the supposition that the sympathetic ganglia arise from neuroblasts that wander from the rudiments of the spinal ganglia and those of sensory ganglia on the cranial nerves. These cells are at first apolar and proliferate by karyokinesis. His and others show that there is an actual migration of such neuroblasts. The ganglionic centres associated with the visceral organs are in turn the results of similar migrations from the chain of sympathetic ganglia.

The fibres of the sympathetic are usually non-medullated. The cells, unlike those of the spinal ganglia, are usually multipolar; very different, however, are the peculiar spirally wound cells shown in Figs. 14 and 15. Small cells in the stroma of glands and in the plexuses of the intestines, or in the walls of blood-vessels, supply free dendritic termini to the muscular and epithelial

NERVOUS SYSTEM

REFLEXES: LOCALIZATION IN THE SPINAL CORD.

<i>Segment.</i>	<i>Muscles.</i>	<i>Reflexes.</i>	<i>Sensory Innervation of Skin.</i>
2 and 3. Cervical.	Sterno-mastoid. Trapezius. Scaleni, &c. Diaphragm.	Inspiratory reflex from pressure on ribs.	Neck and occiput.
4. Cervical.	Diaphragm. Supra- and infra-spinatus. Deltoid. Biceps and coraco-brachialis. Supinator longus. Rhomboides.	Enlargement of pupil from neck irritation (from 4th to 7th cervical).	Neck, upper shoulder, lateral aspect of arm.
5. Cervical.	Deltoid. Biceps and coraco-brachialis. Supinator longus and brevis. Pectoralis (part). Serratus magnus. Rhomboides. Brachialis anticus. Teres minor.	Scapular reflex (5 cervical to 1 thoracic). Tendon reflex of the corresponding muscles.	Dorsal aspect of shoulder and arm. Lateral aspect of upper arm and forearm.
6. Cervical.	Biceps. Brachialis anticus. Pectoralis (part). Serratus magnus. Triceps. Extensors of hand and fingers. Pronators.	Reflexes of the tendons of the extensors of the upper arm and forearm. Tendons of joints of hand (6-8 cervical).	Lateral aspect of forearm. Dorsal aspect of hand and radial region.
7. Cervical.	Caput longum of triceps. Extensors of hand and fingers. Flexors of hand. Pronators of hand. Pectoralis (part). Subscapularis. Latissimus dorsi. Teres major.	Closing of fingers from blow on volar aspect of hand. Palmar reflex (7 cervical to 1 thoracic).	Radialis region of hand.
8. Cervical.	Flexors of hand and fingers. Intrinsic muscles of hand.	Pupil reflex.	Region of distribution of medianus nerve.
1. Thoracic.	Extensor pollicis. Small muscles of hand, &c.	Pupil reflex.	Medianus and ulnar nerve regions. Ulnar nerve region.
2-12. Thoracic.	Muscles of back and abdominal regions. Erectores spinae.	Epigastric (4-7 thoracic). Abdominal (7-11 thoracic).	Skin of the breast, back, and belly, and upper gluteal region.
1. Lumbar.	Ileo-psoas. Sartorius. Ventral muscles.	Cremaster reflex (1-3 lumbar).	Skin of pubic region, ventral aspect of scrotum.
2. Lumbar.	Ileo-psoas. Sartorius. Flexors of knee. Quadriceps femoris.	Patellar reflex (2-4 lumbar).	Lateral aspect of hip.
3. Lumbar.	Quadriceps femoris. Adductores femoris, &c.		Ventral and mesal aspect of hip.
4. Lumbar.	Abductores and Adductores femoris. Tibialis anticus. Flexors of knee.	Gluteal reflex (4-5 lumbar).	Inner aspect of hip and leg to ankle. Inner aspect of foot.
5. Lumbar.	Flexors of knee. Rotation of hip. Flexors of foot. Extensors of toes. Peronei.		Dorsal side of hip and thigh and lateral aspect of foot.
1 and 2. Sacral.	Flexors of foot and toes. Peronei. Small muscles of foot.	Plantar reflex.	Dorsal side of thigh, lateral aspect of leg and foot.
3-5. Sacral.	Muscles of perineum.	Achilles tendon. Bladder and rectal reflexes.	Skin of sacrum, anus, perineum, and genitals.

structures in a wealth of detail until recently unsuspected.

From the cervical sympathetic arise pupil-dilating fibres; vaso-motor fibres for the side of the face, ear, part of eye, vessels of the oesophagus, larynx, thyroid body, and the brain and its meninges; also secretory and vaso-motor fibres to the salivary glands and perspiratory fibres. From the thoracic and abdominal sympathetic arise the sympathetic part of the cardiac plexus with its acceleratory fibres. The cervical and splanchnic portions contain fibres whose central stimulation

Fig. 14. Cell from sympathetic ganglion of frog, with neurite originating within the cell, and dendrites of another cell spun closely around it. (From Kölliker after Arnold.)

excites the cardio-inhibitory system and the vaso-motor centre of the medulla oblongata. The splanchnic, coeliac, and mesenteric plexuses govern the vaso-motor functions of the viscera, as well as the specific functions of these organs.

The sympathetic may rank as the least understood of the nervous mechanisms. The constant interaction with the central nervous

system undoubtedly affords a basis for the somatic background of conscious life. It is well known that the vaso-motor changes are closely associated with emotional states, and that alterations in circulation precede, if they do not produce, emotions, such as fear. The close association of visceral disease with mental degeneration suggests other relations whose physiological rôle is as yet obscure.

Nervousness [Lat. *nervosus*, sinewy, vigorous]: Ger. *Nervosität*; Fr. *nervosité*, *nervosisme*; Ital. *nervosismo* (or *neurosismo*).

A state of the nervous system characterized by an instability which may become variously manifest in conduct, emotion, and thought.

It is a frequent transitory experience in normal life, and is then often produced by a mixed group of predisposing causes, in which fear or apprehension is apt to be prominent. The apprehensiveness preceding an appearance before the public, the impatient awaiting of an announcement which may seriously affect one's welfare, the uneasiness or alarm provoked by a thunderstorm, the excitement of a patient before an impending operation may serve to suggest pertinent instances. The special sensitiveness to pain, and the anticipation of pain by imagination, are further nervous characteristics. Other symptoms of nervousness are motor restlessness, a tendency to start on slight alarm, palpitation, slight tremor, cold perspiration, tendency to be emotionally affected, excitability, irritability, and the like. Such moments or periods of nervousness may vary in intensity from slight deviations from normal equilibrium up to paroxysmal attacks of emotional disturbance, sometimes called 'nerve-storms.' The former may be considered as perfectly normal incidents under the influence of undue stress and strain, of critical periods of life, of ordinary fluctuations in physical and mental health. The latter are more or less pathological, and reflect an over-excitability condition of the nervous symptoms which, according to the accompanying systems and circumstances, may be recognized as neurasthenic, hysterical, epileptic, maniacal, &c.

Considered temperamentally, nervousness is a predisposition to states of instability of control; as such it plays a prominent part in the composition of human character as well as in the aetiology of mental disorders. Particularly in the problems of modern civilization, in the life that is lived under high pressure, with manifold demands on brain and sense-organs, on the emotions and the will, does the question of nervousness become of ever-increasing importance. The most direct pathological relation of nervousness is to NEURASTHENIA (q.v.); but it is also of fundamental importance in the aetiology of hysteria and other functional neuroses. The tendency to regard nervousness as equivalent to neurasthenia is not desirable, as the latter describes a typical disorder, while the former refers to a symptom or a temperamental

characteristic which may accompany other disorders or may be quite normal.

Literature: see NEURASTHENIA; also KRAFFT-EBING, *Nervosität u. neurasthenische Zustände* (1895); A. DE GIOVANNI, *La Neurosi* (1900). (J.J.)

Nescience [Lat. *scientia*, knowledge, + the negative prefix *ne-*]: Ger. *Nichtwissen*; Fr. *nescience*; Ital. *nescienza*. Literally, the condition of ignorance; but in a recent quasi-technical philosophical use, the theory that certain forms of reality (as God, the soul, matter in itself, &c.) are beyond our knowledge.

While often used as equivalent to AGNOSTICISM (q.v.), it is also employed to describe the philosophy of Hamilton and Mansel, who would repudiate the title of Agnostics, but who hold that only an indirect or mediate knowledge of the existence of the Absolute, akin to faith or belief rather than to thought, is possible. (J.D.)

Nestorians: Ger. *Nestorianer*; Fr. *Nestoriens*; Ital. *Nestoriani*. A sect of early Christians, founded by Nestorius, who maintained the individual distinctness of the divine and human elements in the nature of Jesus Christ, and consequently his bi-personality under the appearance of a unitary consciousness.

The doctrine of Nestorius roused a controversy which engaged the attention of a number of councils, and was finally settled by the banishment of Nestorius from Antioch, the Nestorian stronghold, about A.D. 433. The sect was transferred to Edessa, where it continued to flourish, spreading into Egypt, Arabia, India, and China. After the rise of Mohammedanism and during the Arabian domination in the East they increased their influence and stimulated an important intellectual development among the Arabs, the centre of which was at Bagdad. For several centuries they have been steadily declining, but still constitute several important communities of Eastern Christians.

Literature: SMITH and DWIGHT, *Researches* (1833); GRANT, *Nestorians* (1841); DOUCIN, *Hist. du Nestorianisme*; ANDERSON, *Hist. of Missions in the Oriental Churches*; WALCH, *Gesch. d. Ketzereien*; BAUER, *Gesch. d. Dreieinigkeit*; UEBERWEG, *Hist. of Philos.*, i, 'The Nestorians.' (A.T.O.)

Net [Lat. *nitidus*, clear, pure, through Fr.]: Ger. *Netto*; Fr. *net*; Ital. *netto*. Whatever part of a quantity remains after deducting the negative quantities which offset it. For instance, net income is an excess of income

above expenses. 'If a person is engaged in business, his net income is found by deducting from his gross income the outgoings that belong to its production' (Marshall).

The conception of net income or earnings seems a simple one, but is really very perplexing. What are the expenses involved in the production of a certain article? Do they include the personal expenditures of the producer which fit him for doing his work more thoroughly? Marshall, in his conception of public net income or *national dividend*, does not include these things as business expenses; but it is hard to give a reason for excluding them. On the other hand, if we once begin to include any such expenses in our deduction, it is almost impossible to tell where to draw the line. The best work in this subject has been done by Cannan. (A.T.H.)

Neuralgia [Gr. *νεῦρον*, nerve, + *ἄλγος*, pain]: Ger. *Neuralgie*; Fr. *névralgie*; Ital. *neuralgia*. A nervous disorder characterized by paroxysmal pain, which is usually along the distribution of one nerve, and unilateral, and which is not due to changes in the periphery of the nerve or to organic disease, but to nutritive or functional changes in the conditions of the nerves or to NEURITIS (q. v.).

Neuralgia is especially prone to occur in families of neurotic temperament. It is rare in early youth, largely confined to middle life, more frequent in women than in men, and is often induced by cold, exhaustion, overwork, worry, mental shock, lack of rest, and the strains accompanying periodic physical functions. The first attack quite generally comes on when the subject is in a condition of general or special debility. The attacks may appear suddenly and spontaneously, or may be preceded by a brief feeling of numbness or anaesthesia, by twitching, or by an indisposition which ushers in the nerve-pain at first in brief darts of minor intensity and then in more continuous but still periodic spasms of severe burning, boring, or shooting pains, until these in turn become less and less frequent, and leave the sufferer in an exhausted condition. Neuralgias are of an indefinite number of varieties, according to the nerves affected, the distinction between superficial and visceral neuralgias being a prominent one. Painful points which are sensitive to pressure are often present.

Literature: all the treatises on nervous diseases (e.g. GOWERS) contain adequate descriptions of neuralgia. For a special treatise see CHAPMAN, *Neuralgia* (1873); and

especially BERNHARDT, in *Nothnagel's Spezielle Pathol. u. Therapie*, xi, Pt. II. 185-440; HALLION, in *Traité de Méd. de Charcot*, vi. (1895); BOULAY, in *Manuel de Méd. de MM. Debove et Achardon*; GROCCO, in *Trat. ital. di Patol. e Terapia med.* (1898). (J.J.)

Neurasthenia [Gr. *νεῦρον*, nerve, + *σθένος*, strength]: Ger. *Neurasthenie*; Fr. *neurasthénie*; Ital. *neurastenia*. In general, nervous debility or weakness (cf. NERVOUSNESS); but usually employed in a more special sense to indicate a pronounced degree and form of such weakness, with typical symptoms of a morbid character.

Historical. While the condition was in a measure known and partially described by older writers (Robert Whyte, 1765, Marshall, Darwin, Villemain, Jaeger, and others), its modern prominence dates from the writings of Bouchut (1860) and Beard (1868). The latter brought the term neurasthenia into general use, although it was employed in 1867 by Van Dusen, and occurs in Dunglison's *Medical Dictionary* of 1833 (Dercum). Of other names for the malady may be mentioned encephalasthenia (Althaus), the French nervosisme, cachexie, and the more popular terms, nervous prostration, nervous exhaustion, failure of brain power, pathological fatigue, morbid irritability.

Varieties. Neurasthenia is a symptom-complex occurring, like hysteria, under the most varying circumstances, but so frequently alone that in a great majority of cases it may be recognized as a true idiopathic condition. In the ordinary typical cases the symptoms partake of a mental as well as a sensori-motor character, and this type has been termed cerebro-spinal. When the mental symptoms are particularly marked and the motor symptoms not prominent, the condition is by some termed cerebral neurasthenia (cerebrasthenia, encephalasthenia); while spinal neurasthenia (myelasthenia) is characterized by motor abnormalities, particularly by difficulty in walking, by a feeling of sinking of the limbs, by abnormal locomotor tendencies, &c. A specific sexual neurasthenia has been described by Beard, Krafft-Ebing, and others; gastric or dyspeptic neurasthenia (nervous dyspepsia) has received special attention (Glatz). Hystero-neurasthenia is an approximation of neurasthenical symptoms to a hysterical type—a condition emphasized by French writers. Hereditary, traumatic, adolescent, neuralgic, and other forms of neur-

asthenia are mentioned in literature. In some cases it is difficult to distinguish neurasthenia from a mere pronounced temperamental peculiarity, or from rudimentary paranoia, or the prodromal symptom-complexes of other nervous and mental diseases (dementia praecox, general paralysis, paranoia). It seems best to regard the general difficulty as of one main type, with tendencies for certain groups of symptoms (motor, sensory, hypochondriacal, depressive, fatigue, &c.) to become specially emphasized. Of other maladies associated with neurasthenia, neuralgia and migraine are the most frequent.

Nature and Course. Neurasthenia is a functional disorder of the central nervous system. The nature of the disturbance which conditions the neurasthenic state is not known. Neurasthenia is, with few doubtful exceptions, of a chronic character; its onset is slow; the symptoms ensue in irregular sequence; they appear first in lighter and then in more cumulative form, and the entire attack often covers a period of many years. A marked characteristic is the fluctuation and recurrence of the symptoms both in shorter and longer periods, while moments of intense paroxysmal attacks are not uncommon. As the disease is often of long standing before treatment and recovery begin, so there is also a considerable period of convalescence, during which many of the typical neurasthenic symptoms persist. Not unfrequently some traces, like scars, remain almost indefinitely. The disorder is rarely fatal, nor is it prejudicial to longevity.

Aetiology. It cannot as yet be determined to what extent heredity, early development, and later influences tend to form peculiar 'neurasthenic' constitutions, the aggravation of which is known as constitutional chronic neurasthenia, with its exacerbations and special types; and also to what extent transitory debilitating conditions can produce the chronic exhaustion which is commonly termed nervous prostration or acquired neurasthenia. Speaking in general terms, we may recognize the hereditary predisposition as the most prominent aetiologically. Ziehen finds that a neurotic inheritance is traceable in 74 per cent. of all cases; that men are more liable to the disorder than women; that the years from twenty to thirty yield relatively the largest proportion of cases, and that 70 or 80 per cent. of cases occur between the ages of twenty and fifty years. Race and nationality, social status and mode of life,

are of influence, but no exact relation has been determined. The effects of unhygienic conditions of life, of abnormalities of sexual life, of accidents, over-exertion, fright, and of ill health generally, and most frequently the accumulated strain of overwork under conditions of worry and stress, may be traced as causal factors. Professional brain-workers and those engaged in responsible and worrying positions are particularly disposed to the disorder. Neurasthenia has been characterized as the typical malady of modern civilization.

Symptoms. The symptoms of neurasthenia may be considered under the head of (1) mental attitude; (2) the subjective sensory and motor disturbances; (3) the physical condition. The great variability of the symptoms and their tendency to involve more than one of these factors must not be lost sight of. (1) Prominent mental symptoms are the difficulty in holding the attention for a protracted effort, a speedy fatigue, a diminished readiness for acquisition of new impressions, momentary states of confusion and distraction, mental restlessness and unsettlement, the persistence of unbidden thoughts, irregularity of memory, a lack of pleasure in ordinary occupation, irritability, excessive anxiety about small affairs, lack of self-control, an undue occupation with one's own bodily and mental condition, unreasonable fears and aversions, marked idiosyncrasies, and the like. Along with these there are often periods of intense depression (particularly in severe cases or where the disorder reaches its worst stages), occasionally leading to suicide.

This great variety of mental symptoms is more or less easily traced to states of fatigue and the irritability characteristic of certain phases of fatigue. The neurasthenic fears are characteristic, and often constitute the most distressing symptoms. Their unreasonableness is recognized by the patient; conduct is often carried out in opposition to them, but they always occasion anxiety, distress, and a feeling of impending calamity. Almost all the various PHOBIAS (q.v.)—agoraphobia, claustrophobia, mysophobia, and so on—have been noted in neurasthenia. Such hesitation in conduct may be properly viewed as a defect of will or irresolution. This is exhibited in the difficulty of maintaining the attention, the restlessness, the slow and weak attempts to throw off invalid habits, the dependence upon others, and the necessity

of constant stimulation and encouragement. (2) Of first importance among the sensory symptoms are the paraesthesias, or abnormal sensations, and the characteristic pains. Such paraesthesias are difficult to describe. The patient complains of a feeling of tightness in the head, a feeling of heaviness, a feeling of inward pressure (this symptom, 'Kopfdruck,' Ziehen finds in 85 per cent. of all cases), a sense of confusion in orientation, and various forms of VERTIGO (q.v.). He is subject to various dull, aching pains, or fatigue pains as the result of slight exertions, while specific throbbing or piercing local pains in the head or spine are not uncommon. The tendency of such symptoms to fluctuate and to disappear under proper mental stimulation indicates their quasi-subjective (psychogenic) character. Disturbances of the specific sense-impressions are less common. Blurring of the images, as in protracted reading; difficulty in accommodation; buzzing, pulsating, or beating in the ears; tickling or itching in the skin, and local hyperaesthesias are frequently noted. Of motor disorders may be mentioned a muscular weakness often markedly felt, and which, probably in combination with a vaso-motor disorder, at times gives rise to a feeling of faintness and impending unconsciousness. Tests with the dynamometer indicate an abnormally early appearance of fatigue symptoms. Delicate co-ordinations are often affected; the handwriting loses in definition; slips of the tongue in speaking, twitching of the muscles, tremor, hoarseness, or a hollow sound of the voice, and motor restlessness are also common. Disorders in the reflexes are frequently noted. The knee-jerk is apt to be exaggerated, or to present irregularity of action. In spinal neurasthenia, motor disorders of locomotion are marked. (3) Bodily symptoms are not uncommon accompaniments of neurasthenic conditions, however insufficient in themselves for a diagnosis of neurasthenia. Anaemia is often present; the heart action may be irregular; digestive disturbances are quite common; the palms of the hand may perspire under unusual conditions; there may be a special sensitiveness to heat and cold and to changes of the weather; the respiration is often accompanied with effort, a sort of neurasthenic asthma; an explosive irritating cough may appear; a peculiar flushing of the skin when touched or stroked may be observed, while irregularities in the urine (oxaluria, phosphaturia, and excess of uric acids and urates) are particularly significant.

Sexual abnormalities, both as symptoms and as aetiological factors, are often present, and when prominent form the sexual type of neurasthenia. Irregularities of sleep, mostly insomnia, are the rule; even where the amount of sleep is sufficient it is apt to be interrupted and unrefreshing in character.

Interpretation. The keynote of neurasthenia is an inability to recuperate, due to a subjective disturbance of balance between efficiency and output of energy; hence the characteristic feeling of exhaustion, with the peculiar sensations of pains and fears, and the cumulative effect of irritability accompanying weakness and fatigue. Physically it becomes manifest, apart from excessive exhaustibility, in the prostration of the nutritional functions, and quite usually in profound vaso-motor disorders. Neurasthenia thus illustrates the effects of a pathological fatigue, and illustrates as well the varied and widespread manifestations of such a fatigued condition. Neurasthenia further is peculiarly subjective (psychogenic) in many of its symptoms; such symptoms are not without objective basis, nor are they in any true sense feigned or assumed; but they are so markedly aggravated and made chronic by self-consciousness and worry and so generally subject to emotional influences as to suggest a quasi-subjective origin. Neurasthenia further illustrates the importance of the emotional factors in mental processes. It is mental worry rather than overwork that induces the fatigue of neurasthenia; it is the environment, free from anxiety, that is so much more difficult to procure than mere rest from exertion. The emotional factor conditions the fatigue potentiality of overwork; the emotional attitude often makes the distinction between work and recreation, and it is because this emotional attitude is so largely a matter of temperament that neurasthenia exists as a diathesis, even where it does not become developed as a specific disorder. In the disease itself the prominence of the emotions is exhibited most of all in the morbid fears and in the depression and irritability that in some cases constitute the most important symptoms.

The relation of neurasthenia to the conditions of modern existence, particularly in large cities, is doubtless an important one. The disease is not a new one, however, though brought into prominence by recent study. In the overwork of the schoolroom, in the stress and strain of youthful ambition, in the worry

and competition of commercial enterprise, the cares of public life, the inconsiderate absorption of the scholar, the excessive demands of society, the hunger for wealth and station, the incessant wear and tear of a modern metropolis, and in other unwholesome influences, certainly lie the influences by which neurasthenia is propagated. The contrast between these conditions and those of a half-century or more ago may well explain the increased frequency of the disorder.

Exhaustion* (1880); Amer. *Nervousness* (1881); and *Sexual Neurasth.* (1884); CORNING, *Brain Exhaustion* (1884). More recent: KRAFFT-EBING, *Die Nervosität u. d. neurasth. Zustände* (1895); F. C. MÜLLER, *Handb. d. Neurasth.*, in *Moebius, Neue Beitr.*, ii. 62-122; LOEWENFELD, *Pathol. u. Ther. d. Neurasth. u. Hysterie* (1894, with bibliog.); BINSWANGER, *Die Pathol. u. Ther. d. Neurasth.* (1896); GILLES DE LA TOURETTES, *Les états neurasth.* (1898); BOUVERET, *La Neurasth.* (2nd ed., 1891); LEVILLAIN, *La Neurasth.* (1891); GLATZ, *Dyspepsie nerv. et Neurasth.* (1898); KRAEPELIN, *Psychiatrie* (1898), ii. 45-56, 520-62; MOLL, *Das nervöse Weib* (1898); SCHRENK-NOTZING, *Neurasth.* (1894); ALTHAUS, *Failure of Brain Power* (1898); CULLERRE, *Nervosisme et Neuroses* (1887); BOREL, *Nervosisme et Neurasth.* (1894); DORNBLÜTH, *Nervöse Anlage u. Neurasth.* (1896). See also *NERVOUSNESS*. (J.J.)

Neuraxis [Gr. *νεῦρον*, nerve, + *ᾠξων*, axis]: Ger. *Centralnervensystem*; Fr. *névraxe*, *axe cérébrospinal*; Ital. *neurasse*. The cerebrospinal axis, or central nervous system, including the brain and spinal cord. Other terms used are myelencephalon, neuron, axion. (H.H.)

Neurility [Gr. *νεῦρον*, nerve]. Sometimes used for nervous conduction. See *NERVE STIMULATION AND CONDUCTION*.

Neurite [Gr. *νευρίτης*]: Ger. *Neurit* (Rauher), *Neuraxon* (Kölliker); Fr. *cylindre-axe*; Ital. *cilindrassè*. The main or cellifugal process of a nerve-cell. Cf. *DENDRITE*, and *NEUROCYTE*.

The neurite, or 'axis-cylinder' process, is commonly more simple than the dendrite, though not devoid of collaterals, and ending sooner or later in free arborizations or an *END-ORGAN* (q. v.). (H.H.)

Neuritis [Gr. *νευρίτης*]: Ger. *Nervenenzündung*; Fr. *névrite*; Ital. *neurite*. An

inflammatory condition of a peripheral nerve.

Severe functional disturbance, such as neuralgia, may occur without inflammation, but where acute or purulent neuritis occurs it may advance until *DEGENERATION* (q. v.) supervenes. The axis cylinder resists the longest, and may be regenerated after extensive destructive processes have taken place. Where the inflammatory changes are slight and chronic, the state is spoken of as chronic degenerative atrophy. Where various parts of the body are simultaneously affected the disease becomes a multiple neuritis. Alcoholic multiple neuritis is a common form of the latter, and this type may include sensory or motor fibres, or both. (H.H.)

Neuroblast [Gr. *νεῦρον*, nerve, + *βλαστός*, layer]: Ger. *Neuroblast*; Fr. *neuroblaste*; Ital. *neuroblasto*. An embryonic nerve-cell of the central nervous system; an immature *NEUROCYTE* (q. v.). Cf. *NERVOUS SYSTEM* (*Histology*). (H.H.)

Neurocyte [Gr. *νεῦρον*, nerve, + *κύτος*, cell]: Ger. *Neuron*; Fr. *neurone*; Ital. *neurone*. The adult nerve-cell of whatever kind within the central system, together with all its appendages. A recent usage, however, applies the term to the cell-body to the exclusion of the appendages. The former is preferred. Cf. *NEUROBLAST*, and *NEURONE*.

The appendages are usually of two orders, *DENDRITES* (q. v.) and the *NEURITE* (q. v.). The latter may be secondarily provided with sheaths and other accessories. The stimulus normally enters through the dendrites and discharges through the neurite. Both neurite and dendrites break up at their termini into *ARBORIZATIONS* (q. v.). A variety of terms have been proposed for the unit of nervous structure. 'Ganglion cell' is inapt, for a ganglion, in strictness, is an extra-axial cell cluster. 'Neuron' (Waldeyer) is largely used, but aside from the matter of etymology, it has been used (Wilder) in the sense of the entire axial nervous system, as well as (Schäfer) for the *NEURITE* (q. v.) and a portion of the spinal cord (Kölliker). 'Neurodendron' has been recently substituted, but its etymology is ambiguous, and moreover not all neurocytes have dendrites. Analogy and recent usage favour the employment of the termination *-cyte* for mature cells and *-blast* for embryonic cells. See Fish, 'Terminology of the Nerve-cell,' *J. of Compar. Neurol.*, iv (Sept., 1894). (H.H.)

The term *NEURONE* (q. v.) is, however, coming into very general use with this mean-

ing, and may be made general without confusion with the shorter form neuron. See Barker, *The Nervous System*, 39 ff., for discussion and literary references. (J.M.B.)

Neuroglia [Gr. *νεῦρον*, nerve, + *γλία*, glue]: (same in the other languages). The non-nervous supporting framework of the central nervous system.

Two classes of cellular elements are usually included under the term: (1) true connective tissue, of mesodermal origin, brought into the central nervous system in small amounts chiefly with the blood-vessels, and (2) cells and fibres derived from the original ectodermal cells of the embryonic nerve-tube (see BRAIN, Embryology). The latter, or true neuroglia, is composed partly of these original epithelium cells, greatly modified, and partly of derivatives from them, which wander out into the brain substance and there give rise to fibres, which form a dense mesh-work, within which the nervous elements are enclosed. Weigert claims that in the adult human brain the neuroglia fibres are entirely distinct from the neuroglia cells. According to Bevan Lewis the neuroglia cells may function as 'scavenger cells,' assisting in the elimination of effete material. If nerve tissue is destroyed by disease, its place is usually taken by neuroglia.

TAYLOR, *A Contribution to the Study of Human Neuroglia, J. of Exper. Med.*, ii (1897); VIGNAL, *Développement d. Éléments du Syst. nerv.* (Paris, 1889); CARL WEIGERT, *Abhandl. d. Senckenberg'schen Naturf.-Ges.*, xix (1895). (H.H.)

Neurology [Gr. *νεῦρον*, nerve, + *λόγος*, discourse]: Ger. *Neurologie*, *Nervenlehre*; Fr. *neurologie*; Ital. *neurologia*. The science of nervous structures and functions. The scope of neurology is limited by its subject-matter rather than its method, and may be correlated with the departments of myology and osteology,

deriving its chief claim to recognition as an independent science from its direct bearing upon psychology and phylogeny.

Comparative Neurology is not merely that department of neurology which includes the study of the nervous system of inferior animals; the term especially designates that method of approaching the problems of nervous function which employs the combined biological procedures, such as embryology, histology, pathology, physiology, and life history, and applies the results from the lower groups in the interpretation of human neuroses. It is in this sense that the term is employed, e.g. in the *Journal of Comparative Neurology*. See further C. L. Herrick, 'The Problems of Comparative Neurology,' and 'Neurology and Psychology,' *J. of Compar. Neurol.*, i (1891), and Morselli, *Semej. malat. ment.*, ii (1895).

The *Technology of Neurology* is essentially that of modern biology at large. Nearly all the marvellous progress of the last decades can be traced directly to the effect of improved histological and experimental technique. The processes which are most essential are such as permit (1) the fixation, hardening, and preservation of tissues; (2) the sectioning, teasing, or isolation of the substance; (3) the staining, impregnation, and differentiation of the several elements. In the hardening processes (including fixation, &c.) the reagents most useful are chiefly such as contain, or are composed of, alcohol, chromic salts, corrosive sublimate, acetic acid, osmic acid, platinic chloride, formalin, &c. For purposes of sectioning, simple freezing or impregnation with a coagulable or solidifying mixture, such as paraffin, celloidin, gum, soap, &c., precedes the actual slicing with the microtome, after which the adhesive substance is dissolved and the section is prepared for preservation. Staining is sometimes accomplished prior to sectioning, but is often only possible after the delicate section has been glued by means of albumen, collodion, or the like to the glass slip to which it is permanently attached.

The staining reagents are innumerable, but among the most important are compounds of haematoxylin, and various aniline dyes which have selective affinities for various cells or parts of cells, and which react in a way determined by the relation between their own chemical condition and that of these organs. Staining *intra vitam* by means of methylene blue has become a technique by itself, and has

yielded marvellously intricate and delicate pictures of the finest ramifications of nervous fibrils. This method has been especially fruitful in the study of the ultimate termini of the peripheral nerves.

Nissl has introduced a method of applying methylene blue to the cells of the central nervous system, which has been productive of great advancement of our knowledge of the alterations in internal structure which these cells undergo in different functional and pathological states.

The methods of Golgi, and other applications of the idea of precipitating silver or mercury salts within the cellular elements, have effected a revolution in our knowledge of the relations of cell with cell, and demonstrate the unsuspected extent of interrelation and association between centres.

Golgi's method was first published by its inventor as early as 1873, but was not brought into prominence until a decade later, when Golgi's great monograph on the finer anatomy of the nervous system appeared. And indeed this splendid work was ignored by the majority of European anatomists until Forel. His and others worked over the ground and correlated it with the current data of embryology and experimental neurology. Then the import of Golgi's discoveries was first made manifest, and all neurologists eagerly took up the method. Never before had it been possible to see a complete nerve-cell, for none of the older methods bring out the ultimate ramifications of the nervous processes. It now became possible to demonstrate that the nervous system is composed of cells, comparable in embryonic origin and adult structure to those of the other tissues of the body, and the implications of this discovery in physiology and pathology have been very far-reaching. From it has grown the doctrine of the neurone as the structural and functional unit of the nervous system. The validity of the neurone theory and its enormous importance as a tool of research are in no wise dependent (as some seem to suppose) on the idea of the strict anatomical independence of the neurones in the adult body. That they are independent in embryonic origin is well established, but secondary fusions of various kinds may occur during development.

The haematoxylin-copper processes of Wiegert and Pal are still indispensable to a study of fibre-tracts. These methods rest upon the principle that the myelinic sheaths of the medullated nerves, after mordant-

ing in a solution of chrome or copper and staining with haematoxylin, resist the action of a decolorizer longer than do the other tissues. All medullated fibres appear brilliant blue on a clear ground.

Also of great importance are the experimental degeneration methods. The first of these is Marchi's method. If the continuity of a tract is interrupted during life, either by disease or experimentally, degeneration of its fibres ensues (see DEGENERATION). Now, if the specimen is treated first with a solution of chromic salts and then with osmic acid, the degenerated fibres only are blackened by the osmium, and thus the injured tract can be differentiated and clearly followed. Marchi's method brings out the degenerated fibres only. If, now, the centres to which the injured nerve is related are examined by Nissl's method, the cells from which the degenerate fibres spring will show a characteristic 'Nissl degeneration' of their protoplasmic contents, and can thus readily be distinguished from other cells among which they may be mingled.

This principle is employed in the study of the degenerations produced by von Gudden's method, a method of determining the structure and functions of the brain by the removal of parts of the nervous system or sensory organs from a newborn animal, and the investigation of the consequent atrophic changes or secondary degenerations in later life. Upon this method, more than any other, we are dependent for exact knowledge of the ultimate courses of individual tracts in the intricate mazes of the higher centres.

Antiseptic methods permit an amount of operative interference impossible a few years since, and the progress of electrical mensuration is utilized in a study of conductivity and resistance. A statistical method applied to pathology and controlled by necropsy returns, and histological analysis, is daily contributing to our knowledge. The study of the results of FATIGUE in lower animals interprets the conditions encountered in diseased states of man.

Literature: for the detailed application of these methods, consult the technological manuals, especially LEE, *The Microtommist's Vade-Mecum* (4th ed., Philadelphia, 1896), and the works there referred to; also BEVAN LEWIS, *The Human Brain, Histological and Coarse Methods of Research* (1882); POLLOCK, *Die Färbetechnik des Nerven-*

systems (1897), also Eng. trans.; VAN GEHUCHTEN, *Anat. du Syst. nerveux de l'Homme* (3rd ed., 1901); DEJERINE, *Anat. du Syst. nerveux*, i (1896), ii (1901).

On the methylene blue method, see especially P. EHRLICH, *Ueber die Methylenblaufärbung der lebenden Nervensubstanz*, *Deutsche med. Wochenschr.*, xii (1886); H. RIESE gives a general review of the method to date in the *Centralbl. f. allg. Pathol. u. pathol. Anat.*, ii (1891); A. BETHE, *Studien über das Centralnervensystem*, *Arch. f. mikr. Anat.*, xlv (1895). For the list of the contributions to the cytology of the nerve-cell by F. NISSL and others who have used his method, see chap. x of BARKER'S *The Nerv. Syst. and its Constituent Neurons* (New York, 1899); also the extensive bibliography by SMITH ELY JELLIFFE in the *Arch. of Neurol. and Psychopathol.*, i (1898). On the Golgi method consult GOLGI, collected works, translated into German as *Untersuchungen über den feineren Bau des centralen u. peripherischen Nervensystems* (Jena, 1894); an English translation of a part of this work is given by STRONG, under the title *Review of the Golgi Method*, in the *J. of Compar. Neurol.*, vi (1896); A. HILL, *The Chrome-silver Method*, *Brain*, xix (1896); C. WEIGERT has given a comprehensive review in *Merkel u. Bonnet's Ergebnisse d. Anat. u. Entwicklungsgeschichte*, v (1896).

Neuronymy: the nomenclature of the nervous system. It is in a transition state, and the various methodical attempts to secure a uniformity and consistency of usage are, as yet, serving chiefly to call attention to the confusion still existing.

The ambiguity and confusion incident to independent naming of organs, and the use of discordant directional terms, has long been recognized, and individual attempts to remove the inconsistencies have been numerous. Owen, Henle, Parker, Schultze, and Wilder have contributed notably towards a systematic reform, though the immediate result of agitation in each case is to add to the existing confusion.

Most harmful is the ambiguity growing out of uncertainty as to the standard of reference in terms of direction and position, especially when the same relative positions are referred to both lower animals and man. Through the combined influence of F. E. Schultze and B. G. Wilder, we are now rapidly approaching substantial uniformity on the part of careful writers. Thus 'dorsal' and 'ventral' have

very generally superseded 'anterior' and 'posterior,' and instead of 'in an anterior direction' or 'towards the front,' the majority of English writers employ the directive adverb 'ventrad,' though the too frequent use of the suffix '-ad' is offensive to many. 'Forward' or 'upward' as applied to a direction towards the cephalic extremity is replaced by 'cephalad,' 'frontal,' 'rostral,' 'capital,' 'acrad,' 'cranial,' and others, while nearly all writers employ 'caudal' or 'caudad' for the opposite direction. The terms 'proximal' and 'distal,' 'ental' and 'ectal,' 'peripheral' and 'central,' and their adverbs in '-ad,' are very generally used. 'Mesal' and 'lateral' seem to have been less generally acceptable. In Germany the mesal plane is termed sagittal.

In 1895 the results of the deliberations of the German Nomenclature Commission were published by William His. A commission of English anatomists failed to report in time to be incorporated, while the recommendations of the American committees were for the most part ignored. All these recent undertakings have in common a desire to restrict a single name to a single organ, and to employ directive and descriptive terms consistently for all subjects. The preference of the American committees for single-word terms (mononyms) where practicable, although recognized by a majority as desirable, has not thus far been widely adopted because of prejudice against barbaric combinations and in favour of adhering to historical priority. It is impossible in this place to go into details, and the reader is referred to the works cited below. The article by Wilder is the fullest recent discussion, accompanied by extensive comparative tables and a bibliography.

The immediate result of the discussion now in progress may be to prevent much laxity of usage due to carelessness, but unanimity may be long delayed.

(1893); *Die anatomische Nomenclatur*, *Nomina anatomica: Verzeichniss der von der Anatomischen Gesellschaft auf ihrer ix. Versammlung in Basel angenommen Namen. Eingeleitet und im Einverständniss mit dem Redactionsausschuss erläutert*; *ibid.*, Suppl.-Bd. (1895); W. KRAUSE, *On Anatomical Nomenclature*, *Brit. Assoc. Rep.* (1891); also

Int. Monatssch. f. Anat. u. Physiol., ix (1892); T. JEFFREY PARKER, On the Nomenclature of the Brain and its Cavities, Nature, xxxv (1886); P. H. PYE-SMITH, Suggestions on some Points of Anatomical Nomenclature, J. of Anat. and Physiol., xii (1877); B. G. WILDER, Neural Terms, International and National, J. of Compar. Neurol., vi. (Dec., 1896) 216-352; Proc. Assoc. of Amer. Anatomists, Tenth Session (1897), 27-60; C. L. and C. JUDSON HERRICK, Inquiries regarding Current Tendencies in Neurological Nomenclature, J. of Compar. Neurol., vii (March, 1898), embodying the results of an attempt to secure a consensus of views by means of a circular sent to neurologists in the interests of this work. (H.H.)

Neuromeres [Gr. *νεῦρον*, nerve, + *μέρος*, part]: Ger. *Nervensegmenten*; Fr. *renflements métamériques de la moelle*; Ital. *neuromeri*, *neurotomì*. Node-like and transitory dilatations of the medullary tube resembling the primitive segmentation (metameric) of the embryonic body.

Widely divergent views are held as to the significance of these structures, which can no longer be held to be artifacts. Recent observations tend to render doubtful the theories that this segmentation is wholly due to mesodermic influence or entirely a result of the proliferations at the root of the nerves. They have a constancy, moreover, indicating that they can hardly be accidents of growth.

Literature: B. H. WATERS, Primitive Segmentation of the Brain, Quart. J. Microsc. Sci., N.S., xxxiii (1892); W. A. LOOY, Contribution to the Structure and Development of the Vertebrate Head, J. of Morphol., xi (1895); NEAL, The Segmentation of the Nervous System in *Squalus acanthias*, Bull. Mus. Compar. Zool., xxxi. 7 (1898). The two last contain full bibliographies, in which consult especially the works of HOFFMANN, KUPFFER, BÉRANECK, VAN WIJHE, and FRORIEP. (H.H.)

Neuron [Gr. *νεῦρον*, a nerve]: Ger. *Neuron*; Fr. and Ital. *neurone*. Originally employed in English for the central nervous system, or NEURAXIS (q. v.), but has of late come into general use as a name for the nerve unit (after Waldeyer). See NEURONE, and NEUROCYTE. (H.H.)

Neurone: for foreign equivalents see NEURON. The unit of nervous structure, NEUROCYTE (q. v.), or nerve-cell, a term free from the ambiguity attending the German

form Neuron, and hence preferred by many of the most recent writers, especially in America. See L. F. BARKER, *The Nervous System* (1899), chap. v. (H.H.)

Neuronymy: see NEUROLOGY.

Neuropathy [Gr. *νεῦρον*, nerve, + *πάθειν*, suffering]: Ger. *Nervenleiden*, *Neuropathie*; Fr. *névropathie*, *affection* (or *maladie*) *nerveuse*; Ital. *neuropatia*. An abnormal or diseased condition of the nervous system or some part of it. See NEUROSIS. (H.H.)

Neuropilem [Gr. *νεῦρον*, nerve, + *πίλος*, hair]: Ger. *Neuropilem*, *Nervenzilz*; Fr. (not in use—Y.D.); Ital. *neuropilema*. A meshwork of nervous arborizations forming a system of intercommunication between various neurocytes; contrasted with neuroreticulum or histological plexus.

Modern research has made it increasingly evident that actual anatomical continuity between the terminal arborizations of centrifugal and centripetal systems is not necessary to nervous interchange. The methylene-blue method of Dogiel has, however, demonstrated association by continuity in the retina and skin, and it probably exists to a greater or less extent in the central system. Cf. NERVOUS SYSTEM (Histology). (H.H.)

Neuroplexus: for foreign equivalents for PLEXUS, see that term. An interlacing meshwork of peripheral nerve-fibres (to be distinguished from a vascular plexus, or meshwork of capillaries). Cf. PLEXUS, and GANGLIO- PLEXUS. (H.H.)

Neuropore [Lat. *neuroporus*]: Ger. *Neuroporus*; Fr. *névropore*; Ital. *neuroporo*. The opening by which the cavity of the medullary tube communicates with the surface at its cephalic extremity; the morphological front of the brain (Kupffer).

The opening has been observed in several groups of fishes, and some indications of it are reported in certain higher animals, but they are transitory. The location of the neuropore is apparently midway of the lamina terminalis.

Literature: C. v. KUPFFER, Stud. z. vergleichenden Entwicklungsgesch. des Kopfes d. Kranioten, i (1893). Compare also the account of A. WILLEY, in *Amphioxus* and the Ancestry of the Vertebrates (1894). (H.H.)

Neurosis [Gr. *νεῦρον*, nerve]: Ger. *Neurose*, *Nervenbeschwerde*; Fr. *névrose*; Ital. *neurosi*. (1) Any activity of a nervous structure as such.

It is, no doubt, true that nerve-cells participate in the vital processes common to all

living structures, and there is undoubtedly a close connection between the nervous and non-nervous processes (cf. TROPHISM, and LIVING MATTER) which makes it difficult to separate the two classes. It might be well to limit 'neurosis' to the nerve processes which have an expression in consciousness, or, in other words, a corresponding 'psychosis.'

(2) A morbid or diseased condition of the nervous system. Functional neurosis is a morbid affection of the nervous system known only by its symptoms and without ascertained anatomical basis. It is doubtless true that an anatomical lesion of some kind does in each case exist, and the classification of diseases as organic and functional is but a concession to our ignorance. Cf. NEUROPATHY. (H.H.)

Neutrality (in law) [Lat. *neutralis*, through Fr.]: Ger. *Neutralität*; Fr. *neutralité*; Ital. *neutralità*. The relation to a belligerent power of another power which is at peace with each of the belligerents, and not an ally of either.

The neutral power is bound, by international law, to render no aid to either belligerent in its prosecution of the war. Its duties are not measured by its own municipal law. As to how far it should prevent its own subjects from giving such aid, the principles of international law are not settled. The United States and England incline to interfere less with the liberty of the citizen, in this respect, than the continental powers of Europe (see Davis, *Int. Law*, chap. xi). *Neutrality Laws*: the statutes of any particular state upon that subject. *Armed neutrality*: in which the neutral power arms to defend its neutral position against violence apprehended from, or offered by, a belligerent; in practice it is almost invariably the result of concerted action or alliances between several neutral powers (Woolsey's *Int. Law*, § 155). *Permanent neutrality*: the position of a state, like Switzerland, which by treaty with neighbouring powers stipulates never to declare war against them, except for a violation of her neutrality; they making corresponding promises. The United States have generally pursued a policy favourable to restricting within narrow limits the duties of neutrals (see Wharton's *Int. Law Dig.*, chap. xxi).

The doctrine of neutrality is a modern one, and originated with the trading cities of the middle ages. Its outlines are sketched, though lightly, by Grotius, the neutral being described as *medius* (*De Iure Belli et Pacis*,

III. i. 5, xvii. 3; cf. Vattel's *Droit des Gens*, Lib. III. chap. vii; Cobbett, *Leading Cases in Int. Law*, Pt. III). (S.E.B.)

New Academy: see PLATONISM, and SCHOOLS OF GREECE.

Newman, John Henry. (1801-90.) Educated at Ealing and at Trinity College, Oxford. Fellow of Oriel, 1823; took orders in the Anglican Church, 1824; vice-president of St. Alban's Hall, 1825-6; tutor of Oriel, 1826-32; a university preacher at Oxford, 1830; travelled in Italy and Sicily, 1832-3; Vicar of St. Mary's, Oxford, 1828-43; joined the Roman Catholic priesthood, 1845; established at Edgbaston a branch of the brotherhood of St. Philip Neri; lectured in 1850-1; was tried for libel and found guilty; was made Cardinal, 1879.

Newton, Sir Isaac. (1642-1727.) Attended school at Woolsthorpe, Lincolnshire, and at Grantham. Entered Trinity College, Cambridge, 1660, where the philosophy of Descartes was prominent. He became subsizar, 1661; scholar, 1664; B.A., 1665; junior fellow and M.A., 1667; senior fellow, 1668; Dr. Barrow's successor as Lucasian professor of mathematics, 1669. On account of the plague (1665), he moved to his country home at Woolsthorpe, where he studied gravity. Member of the Royal Society of London, 1672. Discovered the law of universal gravitation, 1682. Became M.P. for Cambridge, 1689. On account of impaired health, went to Kensington to live, 1725, and died there. He was buried in Westminster Abbey.

Newton's Law (of colour mixture): see VISION, X.

Nexus [Lat. *nexus*, a bond, from *nectere*, to bind, tie]: Ger. *Nexus*; Fr. *nexus*, *lien*; Ital. *nesso*. The mutual dependence of different elements of an ordered series upon one another; same as connection or relation, but containing in addition a suggestion of union into an ordered whole; most frequently used in the phrase 'Causal Nexus.' (J.D.)

Nicolai, Friedrich. (1733-1811.) A self-taught philosophical critic. Attended the orphanage at Halle and the Real-Schule at Berlin. Apprenticed to a bookseller at Frankfort-on-the-Oder, he learned English and Greek in leisure hours, and read notes on lectures by Baumgarten. In Berlin he studied Wolff. He was for twenty-three years an editor, first of the Library of Fine Arts (1757-9), and later of the Universal German Library.

Nicolas of Cusa (or **Nicolaus Cusanus**),

Nicolaus Chryppfs (i. e. **Krebs**). (1401-64.) Received his first training at Deventer in the Society of the Brethren of the Common Life, founded by Geert de Groot. Studied law at Padua. Practised at Mainz (Mayence) until 1428, when he adopted the clerical profession. Deacon in Coblenz, 1431; member of the council of Basel, 1433; entrusted by Pope Eugenius IV with important commissions in France, in Constantinople, and at the Reichstag of Frankfort; appointed cardinal by Pope Nicholas V, 1448; bishop of Brixen, 1450. He made extended missionary journeys in Germany and the Netherlands, quarrelled with Archduke Sigismund of Austria, and was thrown into prison. Many of his writings are still unprinted.

Nidus [Lat.]: same in the other languages. (1) A cluster of nerve-cells within the central nervous system. Sometimes used in place of the more common term **NUCLEUS** (q. v.), on account of the ambiguity of the latter.

(2) A point of infection or centre of origin for a pathological process.

Nidus avis: a depression in the side of the vermis on the ventral aspect of the cerebellum, in which one lobe of the cerebellar hemisphere (the amygdala) is lodged. (H.H.)

Nietzsche, Friedrich Wilhelm. (1844-1900.) Born in Saxony and educated for the ministry at Bonn and Leipzig. Abandoning the clerical profession, he accepted (1870) a professorship in philology at Basle. While at Basle he became the friend of Wagner, whose musical dramas had fascinated him from childhood. In 1876, however, his taste for Wagnerian opera changed to disgust and hatred. About this time also began the first stages of a mental malady which wrecked the later years of his life. In 1880 he resigned his professorship and lived in health resorts. His literary activity was incessant, but in 1889 he became hopelessly insane.

Night-blindness: Ger. *Nachtblindheit*; Fr. *héméralopie*; Ital. *nittalopia*. Unduly reduced vision in dim light or at night; it may vary in degree from slight discomfort to practical blindness.

The vision in daylight or strong light may remain nearly or quite normal. As a symptom it seems most usually associated with a form of intraocular disturbance (retinitis pigmentosa), while it occurs also as a specific disorder in cases of general malnutrition (anaemia, scurvy, fasting, &c.), and may then be regarded as a pathological exaggeration of the normal difficulty in vision in passing from a

brightly illuminated to a dimly lit space. The opposite defect is termed day-blindness. Cf. **HEMERALOPIA**. (J.J.)

Nightmare [ME. *nightmare*]: Ger. *Alpdrücken*; Fr. *cauchemar*; Ital. *incubo*. A troubled dream, with a sense of oppression, fear, or terror.

The terror is often realized as the flight from a monster, the danger of an impending fall, the oppression of an horrible weight and the like. A sharp outcry or confused cry of alarm oftens accompanies the nightmare. See **DREAM**. (J.J.)

Night-walker: Ger. *Nachtwandler*, *Schlafwandler*; Fr. *somnambule*; Ital. *nottambulo*. Literally one who walks at night; but equivalent to sleep-walker. See **SOMNAMBULISM**. (J.J.)

Nihil est in intellectu quod non prius fuerit in sensu [Lat.]. The motto of **SENSATIONALISM** (q. v.).

Nihil ex nihilo [Lat.]. Nothing comes from nothing. Scholastic negative statement of the law of causal dependence. See **CAUSE**. (J.M.B.)

Nihilism [Lat. *nihil*, nothing]: Ger. *Nihilismus*; Fr. *nihilisme*; Ital. *nichilismo*. A term somewhat loosely used, generally by the opponents of a system, to designate its supposed tendencies; namely, to destroy existence, truth, or knowledge. In its strictest sense it means the belief that nothing is, and hence no knowledge is, possible; or that truth in knowledge and obligation in morality have no objective reality. In its contemporaneous use it generally denotes a political or social doctrine rather than a strictly philosophic one; the idea that social progress is to be looked for only in the abolition of all existing social institutions and a return to political void (e. g. Spencer's 'Administrative Nihilism'—Huxley); the extreme being **ANARCHISM** (q. v.).

This doctrine, however, is said to be derived from the emphasis laid on the negative in Hegel's dialectic, especially from the first categories of his *Logic*, in which the dialectical identity of being and non-being is asserted.

The first pure nihilist in philosophic theory was also the last, viz. the Sophist Gorgias of Leontium, who is reported to have taught: (1) that nothing exists; (2) that if anything did exist it would be unknowable; (3) if it existed and were knowable it could not be communicated. The doctrine thus stated has no modern supporters, but certain phases of the Buddhistic doctrine of **NIRVANA** (q. v.)

and of Schopenhauer's doctrine of the annihilation of will might be termed nihilistic. It is generally used nowadays by realists to mark their opinion of the idealistic doctrine of the external world, or, in a similar controversial way, to denote the tendency of doctrines of philosophical scepticism, such as Hume's. Fichte's words, as quoted by Sir W. Hamilton (edition of Reid's *Works*, 129, note), are often used as a proof of the nihilistic character of idealism, but in fact are employed by Fichte to express simply the logical outcome of a partial stage of development, not as a statement of his whole system.

Literature: UEBERWEG, *Hist. of Philos.*, i. 76-8; REID'S *Works*, 478; FICHTE, *Sittenlehre, Werke*, iv. 151. The dependence of Russian nihilism upon a development of Hegel's philosophy is asserted by KAUFMANN, *Contemp. Rev.*, xxxviii. 913. (J.D.)

Nirvana [Sansk. *nīs*, out, + *vana*, blowing]: Ger. *Nirvāna*; Fr. *nirvana*; Ital. *nirvana*. That state of blissful repose which the Hindu devotee realizes when, through the prescribed discipline of his religion, he has extinguished Karma or the principle of individual existence within him, and has thereby obtained deliverance from the doom of the Samsāra, or unending temporal cycle of deaths and reincarnations. See ORIENTAL PHILOSOPHY (India).

Nirvana in its primary meaning has no temporal reference, and hence is not a state to be attained only after death. Death belongs to the Samsāra and is bound up with Karma. Nirvana is the condition reached by the soul that has crucified Karma by renouncing the desire for individual existence. The whole world of individuality, including death, is a sphere of Maia or illusion. Nirvana is freedom from illusion, and on its positive side absorption into, identification with, the blessed life of Brahm the absolute. Negatively, Nirvana may be characterized as the cessation of the striving for individual existence. As to its positive significance, Brahmistic and Buddhistic thought seem to differ; the latter, emphasizing the deliverance which is effected in Nirvana, tends to regard it as little more than the negation of existence, while to the former it is the realization of a man's Atman, his true and infinite self. Rhys Davids, following the Buddhistic interpretation, represents the Nirvana of Buddhism as simply extinction, while Deussen, speaking from the point of view of earlier Brahmistic conceptions, represents it as the realization

on the part of the infinite of 'its own all-pervading, eternal, almighty nature.'

Literature: DEUSSEN, *Philos. of the Vedānta*; MAX MÜLLER, *Buddhist Nihilism*, and art. on Buddhism in *Encyc. Brit.*; *Concise Dict. of Religious Knowledge*, art. 'India.' See the literature given under ORIENTAL PHILOSOPHY (India). (A.T.O.)

Nisus [Lat. *nitor*, to struggle, to strive]: same in the other languages. The inherent tendency in any process of change to strive against obstacles towards its appropriate end. Leibnitz uses it as a quasi-technical term. He denies the existence of mere capacity or potency, holding that reality always issues in act. This remains as *nisus* or active tendency when hindered from expressing itself. In modern physical terms, it is practically the equivalent of energy of position, ready to translate itself into kinetic energy (Leibnitz, *New Essays*, ii. chap. xxi. § 2, and *On the Reform of Metaphysics*).

Nisus formativus is the supposed tendency inherent in every embryonic organism to reproduce the form of its species—a term of speculative biology. (J.D.)

Noctambulism [Lat. *nox*, night, + *ambulatio*, a walking about]: Ger. *Nachtwandeln*; Fr. *noctambulisme*; Ital. *nottambulismo*. Synonym of SOMNAMBULISM (q. v.).

Noetic [Gr. *νοητικός*, from *νοητά*, ideas which can be thought, not imaged, from *νοῖς*, reason]: Ger. *noëtisch*; Fr. *intelligible*; Ital. *noetico*. (1) Referring to concepts which originate in pure, that is, non-sensuous thought. In its more technical use, it excludes ideas arrived at from logical analysis of any sense material, or material imaginatively presented, and is confined to ideas supposed to be self-generated by reason. In a looser use, it denotes ideas freed from sensuous reference, independent of question as to mode of origin.

(2) Involving more or less cognitive process, as in the phrases 'noetic consciousness,' 'noetic SYNTHESIS' (q. v.). See also COGNITION.

The term *anoetic* is applied to consciousness, mental states, &c., which do not involve cognition, as, for example, hypothetical pure affection or conation. Cf. Stout, *Analytic Psychol.* (J.M.B.)

In accordance with their general philosophical presuppositions, the early Greek writers assumed that all distinctions in existence were the counterparts of distinctions in modes of knowing and vice versa. When it

was seen that certain experiences appeared to have permanent and general validity, while others had to do with the particular and changing, the tendency was to assume a superior form of knowing—reason—and an inferior—sense—and to divide the objective spheres accordingly. Heraclitus and Parmenides contributed to the distinction, but we owe its sharp formulation to Plato. With reference to his theory of ideas, he marks off sharply the incorporeal world, *τόπος νοητός*, the world of conceptions, from the world which is seen, *τόπος αἰσθητικός*, the world of perceptions. The first is the ultimate reality of which the second is but an image.

Aristotle, following Plato, uses the noun *νοητά* to express the essence of real beings taken in their intelligible aspect, their capacity of being rationally apprehended. As the Neo-Platonists made much of the doctrine of *Nous* (q. v.), so the adjective noetic played a large part in their system. The noetic cosmos (*κόσμος νοητός*) expressed the fact that the nous includes within itself a complete system of forms and forces as its own distinctions. Cudworth revived the term with practically the Aristotelian meaning. Sir William Hamilton used it to designate knowledge originated within the mind.

Literature: PLATO, *Rep.*, vi. 507 ff.; *Phaedrus*, 246 ff.; *Phaedo*, 100 D; *Theaetetus*, *Symposium*; ARISTOTLE, *De Anima*, III. iv. 12; PLOTINUS, *Enn.*, vi. 22; CUDWORTH, *Eternal and Immutable Morality*, Bk. II. i. 4, v. 2; HAMILTON, *Lects. on Met.*, xxxviii. See also MARTINEAU, *Types of Ethical Theory*, 443-5. (J.D.)

Noise [OF. and ME. *noyse* and *noise*]: Ger. *Geräusch*; Fr. *bruit*; Ital. *rumore*. A sensation of hearing distinct from the sensation of tone; usually given as mixed noise and tone; characterized by intensity, duration, and pitch.

It is stimulated by air-vibrations of mixed or rapidly changing rates. It was formerly referred to the vestibule, but is now generally held to have its seat in the cochlea of the ear. Cf. *Auditory Sensation* under *HEARING*.

Literature: HELMHOLTZ, *Sensations of Tone*, 7, 8; EBBINGHAUS, *Psychol.*, 283, 284. (E.B.T.—J.M.B.)

Nolition [Lat. *nolle*, to be unwilling]: Ger. *Wider-Willkürhandlung* (see below); Fr. *nolition*; Ital. *nolizione* (not in use—E.M.). Negative VOLITION (q. v.) or the will not to do.

A term not in general use, but convenient. An act of nolition is CONTRA-VOLITIONAL (q. v.), and a decision of nolition is a Veto (see FIAT). ‘Nolitio et aversio sensitiva non sunt actiones privitivae [unvolitional] sed positivae [contra-volitional]’ (Ch. Wolff, *Phil. Pract.*, i. § 38, quoted by Eisler).

The German equivalent is suggested. Nolition is a form of Streben (conation) and also of Widerstreben (negative conation); but is confined to Willkürhandlung (volitional action) as narrower than Willenshandlung (voluntary action). (J.M.B., G.F.S.)

Nominal [Lat. *nominalis*, pertaining to a name]: Ger. *nominal*; Fr. *nominal*; Ital. *nominale*. Relating to a logical term, whether expressed in language or merely a concept of the mind, and not to anything real. Cf. NOMINALISM, and REALISM.

Nominal definition (*definitio nominis*): the declaration of the essence of a word or expression, that is, the necessary and sufficient conditions of its applicability, or the enumeration of marks which suffice, but do not more than suffice, to give the meaning of the term, understanding by the ‘meaning,’ not the whole idea it may convey, but so much as it would require to be intended to convey in order to be a suitable word. Leibnitz says, ‘Habemus quoque discrimen inter definitiones nominales, quae notas tantum rei ab aliis discernendae continent, et reales, ex quibus constat rem esse possibilem, et hac ratione satisfiit Hobbio, qui veritates volebat esse arbitrarias, quia ex definitionibus nominalibus penderent, non considerans realitatem definitionis in arbitrio non esse, nec quaslibet notiones inter se posse coniungi. Nec definitiones nominales sufficiunt ad perfectam scientiam, nisi quando aliunde constat rem definitam esse possibilem.’ This mode of making the distinction has been approved by many nominalists, as J. S. Mill. It cannot satisfy the realists, who demand of the real definition that it should express the real generating nature of the real species which it defines. As for the possibility of the thing, if by that is meant logical possibility, the nominal definition suffices. If more than that is meant, it is out of the province of definition to prove or declare a thing to be possible. A ‘postulate’ defines what is supposed to be possible; a ‘problem’ proves such possibility.

Nominal mode, in the doctrine of modals: a mode of a proposition expressed by an adjective, as ‘Sortem currere est contingens.’ (C.S.P.)

Nominalism [Lat. *nominalis*, from *nomen*, a name]: Ger. *Nominalismus*; Fr. *nominalisme*; Ital. *nominalismo*. The doctrine that universals have no objective existence or validity; in its extreme form, that they are only names (*nomina, flatus vocis*), that is, creations of language for purposes of convenient communication. See REALISM (1) for full account and history. (J.D.)

Nomology [Gr. *νόμος*, law, + *λόγος*, doctrine]: for equivalents see the next topic. The science which investigates laws, as general psychology and general physics; contradistinguished from classificatory and explanatory science. Hamilton says, 'We have a science which we may call the nomology of mind — nomological psychology' (*Lects. on Met.*, vii). (C.S.P.)

Nomology (in law): Ger. *Nomologie*, *Gesetzeslehre*; Fr. *nomologie*; Ital. *nomologia*. Jural science; the science of the conformity of human actions to rules of conduct prescribed by law. 'Ethic is the science mainly of duties, while nomology looks rather to the definition and preservation of rights' (Holland, *Jurisprudence*, chap. iii. 25). The rules of conduct, with which it is conversant, are both those prescribed by the current standard of morality, and those of legislation (*ibid.* 26; Smith's *Right and Law*, § 51). (S.E.B.)

Non-A (in logic): same in the other languages. An expression occurring in the usual forms of statement of the principles of contradiction and excluded middle. It is a term which denotes whatever is supposed not to be denoted by A, and denotes nothing more. (C.S.P.)

Non-being: Ger. *Nichtseiendes*, *Nichts* (*Nicht-sein*); Fr. *non-être* (*néant*); Ital. *non-essere*. Literally, just the absence or negation of being; but in accordance with the Greek tendency to give (unconsciously) an objective meaning to all categories of thought, non-being (*μὴ ὂν*, *μὴ εἶναι*) was assumed as existent, until it became an object of dispute among philosophic schools as to whether non-being is or is not.

The Eleatics (Parmenides, 470 B.C.), who identified it with empty space, holding that everything must be full (or that all that is, is), denied its existence. The Atomists, however (Leucippus), needing a space for their discrete particles to move in, asserted that non-being (the VOID, q.v.) was as real as being (the atoms). Plato (denying empty space as a fact) assumed a relative world of non-being (the counterpart of ignorance) as the opposite

of his ideas, and, interpreting it also as space, regarded it as the matrix out of which the world was created. In not dissimilar fashion the theological doctrine of the creation of the world 'out of nothing' tended to give non-being a quasi-existence, as at least the background of the divine operation. Aristotle attempted to give the term a dynamic interpretation. As all nature moves between the potential and the completed, the potential at once is and is-not. On one side, it is the medium, the matter, through which the form realizes itself; and it is also the restraint which prevents the full exhibition of form, and which is responsible for failures and deviations from the main line of development. In the Neo-Platonists, non-being becomes a highly important category. As empty space and as privation it was the responsible factor in the development of the purely physical world and also the cause of evil. It is the absolute opposite of pure being, which yet, just because it is non-being, reduces the manifestations of being to lower levels. However naive the Greek formulation, it is obvious that through the use of this term there were gradually developed two of the most serious problems of philosophy: one on the side of cosmology, as to the existence of a vacuum, and the possibility of motion without a vacuum; the other the metaphysical and ethical problem of the significance of the negative factor in the universe, of hindrance and imperfection. It is a metaphysical problem, as well as an ethical one, because the value of the concept of growth and development (of change which is qualitative) seems to imply a passage from the potential to the actual, or from (relative) non-being to being. The problem in the former sense was revived by Descartes and in the latter by Hegel. With Hegel, becoming (*Werden*), process, activity are the ultimate and absolute, and thus a negative factor is as necessary as is a positive. In the famous doctrine of the identity of being and non-being is contained the assertion that the immediate or 'first' being of anything negates itself, and thus passes away, and that this passing away turns out to be not complete disappearance, but a development of itself, and so a reconstitution of being upon a higher, more mediate (or significant) plane (cf. the recent development of the doctrine by Ormond, as cited below). Scotus and other mediaeval philosophers had already taught that since God creates the world out of nothing, nothing belongs to the essence of God.

Literat ure: PARMENIDES, v. 33, 35; ARISTOTLE, *De Gen. et Corr.*, i. 8 (for Leucippus's doctrine), and also PLUTARCH, *Adv. Coel.*, 4. 2; PLATO, *Rep.*, v. 476-9, vi. 511; Timaeus; ARISTOTLE, *Physics*, iv. 2 (cf. ZELLER, *Philos. d. Griechen*, iii. 603-23); *Met.*, Bk. XII; PLOTINUS, *Enneads*, iii. 6, 18; ST. AUGUSTINE, *De Civ. Dei*, xii. 2; SCOTUS, *De div. Nat.*, iii. 19; HEGEL, *Logic* (lessor), §§ 87-8, and *Werke*, iii. 72-3 (larger logic); ORMOND, *Basal Concepts in Philos.* (1896). (J.D.)

Non compos mentis [Lat.]: Ger. same, or *nicht dispositionsfähig*; Fr. *incapable, non compos sui*; Ital. same, or *non compos sui*. Incapable through mental impairment or disease of conducting one's affairs; usually employed in a technical or legal sense; cf. COMPOS MENTIS. (J.J.)

Non-contradiction. The 'law of non-contradiction' is another name for the principle of CONTRADICTION (q.v.). See also LAWS OF THOUGHT. (C.S.P.)

Non-ego: Ger. *Nicht-ich*; Fr. *non-moi*; Ital. *non-io*. The opposite of the Ego; the not-me; the external object; the external world. Cf. Ego.

The term is of especial significance, as a technical term, in the philosophy of Fichte; it represents the second positing (the anti-positing—*Entgegensetzen*; see POSIT) of the Ego as that which limits and thereby stimulates and defines the more specific activity of the Ego. See Fichte, *Werke*, i. 101-5, and Fischer, *Gesch. d. neueren Philos.*, v. 438. (J.D.)

Nonsequitur [Lat. for 'it does not follow']. A name which belongs to the slang of the universities for the *fallacia consequentis* (called by Aristotle *ὁ παρὰ τὸ ἐπόμενον ἔλεγχος*, *De Sophist. Elen.*, 167 b 1), which is, strictly speaking, a fallacy which arises from a simple conversion of a universal affirmative, or transposing a protasis and apodosis, or condition and consequent.

Thus Aristotle tells us that the Eleatic Melissus argued that the universe is ungenerated, since nothing can be generated by what does not previously exist. The universe, then, not being generated, had no beginning; and having no beginning, it is infinite. But, as Aristotle remarks, although everything generated has a beginning, it does not follow (*non sequitur, οὐκ ἀνάγκη δὲ τοῦτο συμβαίνειν*) that everything that has a beginning is generated. A fever, for example, is not generated. Such fallacies are extremely common. De Morgan (*Formal Logic*, 268) gives this example:

'Knowledge gives power, power is desirable, therefore knowledge is desirable.' But though whatever is desirable has some desirable effect, it does not follow that whatever has any desirable effect is desirable. An attack of yellow fever has the desirable effect of rendering it unlikely the patient will for a long time have another; still, it is not itself desirable.

But the majority of logicians not only confound this fallacy with the *post hoc, ergo propter hoc*, which Aristotle considers immediately after, but even define it as 'failure in the formal inadequacy of the reason' (Sidgwick, *Fallacies*, II. ii. 4), or as 'the introduction of new matter into the conclusion, which is not contained in the premises' (Hyslop, *Logic*, xviii. 2), or as 'the simple affirmation of a conclusion which does not follow from the premises' (De Morgan, loc. cit.), or as 'any argument which is of so loose and inconsequent a character that no one can discover any cogency in it' (Jevons, *Lessons in Logic*, xxi), or 'to assume without warrant that a certain conclusion follows from premises which have been stated' (Creighton, *Introductory Logic*, § 46). Very many logicians omit it altogether, which is better.

Aristotle, however, could not express himself more precisely: 'Ὁ παρὰ τὸ ἐπόμενον ἔλεγχος διὰ τὸ οἶσθαι ἀντιστρέφειν τὴν ἀκολούθησιν. That is, 'from thinking that the *consequentia* can be converted.' That is to say, thinking that because 'If A, then C,' therefore 'If C, then A.' Owing to the neglect of fallacies by the more scientific logicians, it is not easy to cite many who define the fallacy correctly. The Conimbricenses (than whom no authority is higher) do so (*Commentarii in Univ. Dialecticam Arist. Stagir.*, In lib. *Elench.*, q. i. art. 4); also Eustachius (*Summa Philos.*, Tom. I, pars. III, tract. iii, disput. iii. 9. 3); also Cope, an admirable student of Aristotle, in his note on the *Rhetorics*, B. cap. xxiv. See also the *Cent. Dict.*, under 'Fallacy.' (C.S.P.)

Non-voluntary: Ger. *nicht-strebend*; Fr. *non-volontaire*; Ital. (not in use). ACONATIVE (q.v.). See also ACTION.

Noology [Gr. *νοῦς*, reason, + *λόγος*, theory]: Ger. *Noologie*; Fr. *noologie*; Ital. *noologia* (the equivalents are suggested). That part of philosophy which deals with intuitive truths of reason; as distinct from Dianoiology, which deals with truths discursively or demonstratively established.

A term suggested by Sir William Hamilton, Reid's *Works*, note A, § v, but having no currency. Hamilton probably derived it from

Kant (*Krit. d. reinen Vernunft*, 643). It is used by Crusius for psychology. (J.D.)

Norm (and **Normality**) [Lat. *norma*, a carpenter's square, a rule]: Ger. *Norm*, *Normalität*; Fr. *norme*, *normalité*; Ital. *norma*, *normalità*. (1) A standard type or pattern from which continuous departures are possible in opposite directions. (C.S.P.)

(2) In natural science: the usual, in form, size, and function. Normality is conformity to that usual.

Fluctuations and deviations from normality, both physical and mental, constantly occur, and when within moderate limits are still considered normal; when exceeding such limits they gradually pass into the **ABNORMAL** (q.v.). For examples of the use of this conception in psychological discussions see Maudsley, *Responsibility in Mental Disease*. (J.J.)

Norm and **Normative** (in the moral sciences): Ger. *normativ* (*normgebend*); Fr. *normatif*; Ital. *normativo*. The principle, whether truth or mode of reality, which controls action, thought, and emotion, if these are to realize their appropriate ends; the end as law. The norm of thinking is truth; of emotion, the beautiful; of volition, the good. These principles (and their corresponding philosophic disciplines) are hence termed normative. The three normative sciences are thus logic, aesthetics, and ethics.

Reference to a norm may be roughly taken to discriminate the philosophic from the natural sciences. The latter aim simply to describe phenomena and explain them in terms of laws or principles homogeneous with the facts. The explaining principles are, moreover, mechanical, having to do with conditions of manifestation in time. In the philosophic sciences, facts are interpreted with reference to their meaning, or value—their significance from the position occupied, or part played, by them in the total make-up of experience. The standpoint, moreover, is teleological, since the interest is not in the conditions of origin, but in the fulfilment of purpose in realizing their appropriate values. Whether this distinction is one of objective reality, or one of standpoint and method of treatment, is, however, itself a philosophic problem. According to some writers the distinction between concepts of origin and of value has a distinct ontological reference; according to others the significance is only methodological. That is to say, to the latter there are not two spheres, one of pure phenomena, the other

of ends and values; but the distinction is one of standpoint for purposes of description and explanation. Cf. **ORIGIN** *versus* **NATURE**.

The term norm is closely related to the terms criterion and standard. Criterion applies, however, more definitely to the process of judgment; it is the rule or mode of control as employed to assist judgment in making proper discriminations. A criterion of beauty is the principle employed in arriving at correct estimates or appreciations; a norm of beauty controls (or is supposed to control) the facts themselves in their own meaning. The criterion thus has a more subjective connotation. The standard is the principle used to measure value, and to lay off a scale of values. The standard of beauty is that type or form to which the facts conform in the degree in which the term beautiful is applicable to them. It differs from the norm in that the objectively regulating character of the norm is not necessarily ascribed to it. It agrees with the criterion in referring especially to the process of judgment or evaluation, but differs in that it takes some objective form as its adequate embodiment or manifestation. The criterion is the deciding principle in forming judgments; the standard is the principle which gives content to the adequate judgment. The norm which regulates the value of the facts may also, of course, be the standard by which their relative worths are measured, and the criterion by which the individual is guided in arriving at a correct apprehension of these worths. (J.D.)

Normal (in economics) [Lat. *normalis*, from *norma*, a rule]: Ger. *normal*; Fr. *normal*; Ital. *normale*. (1) In the broad sense, action which conforms to observed economic laws. 'The course of action which may be expected under certain conditions from the members of an industrial group is the normal action of the members of that group' (Marshall).

(2) In the narrower sense, a normal adjustment is one which represents conditions of economic **EQUILIBRIUM** (q.v.), e.g. normal price.

The term normal price was brought into prominence, if not actually introduced, by Cairnes. 'A normal price is reached when the product has so adjusted itself to the demands of consumers that the market price affords the current rate of profit to the producer, who enjoys no extraordinary advantage. We may contrast market and normal price by saying that a market price is one at which, for the

moment, the supply is equal to the demand; while a normal price is one at which, as long as the existing state of things continues, the production is likely to be equal to the consumption' (Hadley). Cf. SUPPLY AND DEMAND. (A.T.H.)

Normal (in law): Ger. *regelrecht*, *normal*; Fr. *normal*; Ital. *normale*. Pertaining to the ordinary individual. 'The rights of a child, a lunatic, or a corporation, are abnormal' (Holland, *Jurisprudence*, chap. ix. 119; xi. 144; xiv. 288).

Literature: for a discussion of the normal rules of human conduct see HEINECCIUS, *Elementa iuris Naturae et Gentium*, Lib. I. chap. i. § 4, and chaps. iii and iv. (S.E.B.)

Normal School: Ger. *Lehrerseminar*; Fr. *école normale*; Ital. *scuola normale*. An educational institution for the preparation of teachers, chiefly for elementary schools; a training college for teachers.

The work of well-equipped normal schools embraces three kinds of activity: (1) instruction in the theory of education as founded upon psychology, ethics, and sociology; (2) instruction in the subject-matter to be taught; (3) direct contact with the problems of teaching in a model or practice school. In thirty-two of the United States the normal school has become an integral part of the public school system.

Literature: see Reports of Normal School Section of the Nat. Educ. Assoc. in the 'Proceedings' from 1871 to the present; also art. on 'Normal Schools' in Johnson's *Univl. Cyc.*, revised ed. (C.De G.)

Normal or Standard Stimulus: Ger. *Normalreiz*; Fr. *excitant normal*; Ital. *stimolo normale*. The stimulus taken as a standard in a series of experiments in which the stimulus is varied with reference to this standard. Cf. PSYCHOPHYSICAL MEASUREMENT METHODS. (J.M.B.)

Normative: see NORM.

Nota notae [Lat.]: The logical principle *Nota notae est nota rei ipsius*, that is, the predicate of the predicate is the predicate of the subject, which is laid down in several places by Aristotle as the general principle of syllogism. The principal passages are as follows:—

'When one thing is predicated of another as its subject, whatever is said of the predicate can also be said of the subject' (*Categ.*, iii. 1 b 10).

'Whatever is said of the predicate will hold also of the subject' (*Categ.*, v. 3 b 4).

'We say that something is predicated universally when nothing can be admitted as coming under the subject of which the predicate will not hold; and the same thing holds of negation' (1 *Anal. pr.*, i. 24 b 28). The term *nota notae* is from the first words of the original of this passage.

'Of whatever the species is predicated, the genus is predicable' (*Topics*, Δ. i. 121 a 25).

Some writers (as Hamilton, *Lects. on Logic*, App. VI. ii) imagine a distinction between the *nota notae* and the *dictum de omni*. Some have been so extravagant as to attribute the former to Kant, in whose *Falsche Spitzfindigkeit* (1762, ii) it is very likely that the precise phrase '*nota notae est nota rei ipsius*' first occurs, though similar phrases, such as '*cui conveniunt notae eidem quoque convenit nomen*,' are common in Wolf's and other logics of the 18th century. But it is clear that in Aristotle's mind it was one principle, essentially that which De Morgan well called the principle of the 'transitivity of the copula.'

Aristotle, in the last but one of the above passages, seems to regard the *nota notae* as following from the definition of universal predication. To say that '*Any S is P*' is to say that of whatever *S* is true, *P* is true. This amounts to deriving the transitivity of the copula from the transitivity of illation. If from *A* follows *B* and from *B* follows *C*, then from *A* follows *C*. This, again, is equivalent to the principle that to say that from the truth of *X* follows the truth of the consequence that from *Y* follows *Z*, is the same as to say that from the joint truth of *X* and *Y* follows *Z*. (C.S.P.)

Note [Lat. *nota*, a mark, a sign]: Ger. (1) *Klang*, (2) *Note*, *Tonzeichen*; Fr. (1) *son*, (2) *note*; Ital. *nota*, *suono*. (1) A 'musical' or COMPOUND TONE (q. v.), as specifically determined in a musical scale. Cf. CLANG.

(2) The written or printed symbol of the musical tone. (E.B.T.—J.M.B.)

Note-blindness: Ger. *Notenblindheit*; Fr. *cécité musicale* (or *notale*); Ital. *cecità musicale*. An infrequent symptom in disorders of the aphasic type, in which there is a loss of the power to read musical notes; it is thus, in the realm of music, the analogue of ALEXIA (q. v.). Cf. AMUSIA, and SPEECH AND ITS DEFECTS. (J.J.)

Nothing (Hegel's *Nichts*): see HEGEL'S TERMINOLOGY, sub verbo. Cf. also NON-BEING.

Notion: Ger. *Begriff* (concept), *Gedanke*

(thought; no exact equivalent, see below); Fr. *notion*; Ital. *nozione*. (1) Sometimes used generally for any kind of apprehension of an object rather than actual perception; but (2) it is better to restrict its application to that element in the apprehension of an object which does not consist in an image.

The general application of the word to any cognitive state is illustrated by the following passage from Reid (*Works*, Hamilton's ed., i. 289): 'The word notion, being a word in common language, is well understood. All men mean by it the conception, the apprehension, or thought which we have of any object of thought. A notion, therefore, is an act of the mind conceiving or thinking of some object. The object of thought may be either something that is in the mind, or something that is not in the mind. It may be something that has no existence or something that did, or does, or shall exist. But the notion which I have of that object is an act of my mind, which really exists while I think of the object; but has no existence when I do not think of it.' The more restricted usage which we propose is suggested by Berkeley (*Princ. of Human Knowledge*, Pt. I. § 142): 'We may not, I think, strictly be said to have an idea of an active being, or of an action, although we may be said to have a notion of them. I have some knowledge of my mind and its acts about ideas, inasmuch as I know or understand what is meant by these words, What I know, That I have some notion of. I will not say that the terms idea and notion may not be used convertibly, if the world will have it so, but yet it conduceth to clearness and propriety that we distinguish things: very different by different names. It is also to be remarked that, all relations including an act of the mind, we cannot so properly be said to have an idea, but rather a notion of the relations and habitudes between things.'

Without committing ourselves to the statement that there are no ideas of relation or even of activity, we agree with Berkeley that some such distinction as he suggests would be very useful. All those modes of cognitive consciousness which are called by James 'psychic fringes,' 'feelings of tendencies,' 'sense of whence our thought is coming and whither it is going,' should be called 'notional' in accordance with the usage we recommend. Under the same head would be brought that 'understanding of the meaning of words' which seems independent of the

mental imagery suggested by them. It should be noted that we do not wish to imply that notional consciousness ever exists in complete severance from mental imagery, though the imagery is often merely verbal. Nor do we, like Berkeley, simply identify idea and image. The idea must include an image: but it also includes whatever notional 'fringe' serves to give the image meaning or significance. Any object considered as an INTENT (q.v.) is necessarily an object of notional consciousness.

As to the German usage, Begriff has served, like concept in English, to cover the whole ground. Wundt (*Grundriss d. Psychol.*, § 17, B) marks off the 'ideational elements,' calling them the *Gesamtvorstellung*; but it remains to find a term for the notional part. Possibly something might be said for *Meinen*, seeing that *Meinung* is suggested for the corresponding consciousness of intent. Both French and Italian admit a distinction of terms as suggested. (G.F.S.—J.M.B.)

Notion (Hegel's *Begriff*): see HEGEL'S TERMINOLOGY, VI, d.

Notochord [Gr. *vōros*, back, + *χορδή*, string]: Ger. *Rückensaite*, *Chorda*, *Wirbelsaite*; Fr. *corde dorsale*, *notocorde*; Ital. *notocorda*. A rod of peculiar tissue constituting the primitive axial skeleton of vertebrates.

It begins immediately behind the pituitary body, and extends to the caudal extremity. It occurs as a permanent structure in fishes, and as a temporary one in the embryos of amphibia, reptiles, birds, and mammals, being functionally replaced in the adult of these forms by the vertebral column, which is evolved around the notochord. Comparative embryology has shown that it is a greatly modified epithelial band, which arises in the embryo from the median dorsal line of the entoderm, being in position and mode of development somewhat analogous to the ectodermal medullary canal, or primitive tubular nervous system.

Literature: MINOT, *Human Embryol.*, 181; GEGENBAUR, *Vergleichende Anat. d. Wirbelthiere* (1898); R. WIEDERSHEIM, *Compar. Anat. of Vertebrates* (trans., 1897). (C.S.M.)

Noumenon, and **-al** [Gr. *νοούμενον*, anything known, from *νοεῖν*, to perceive, know]: Ger. *Noumenon* (-al), *DING AN SICH* (q.v.); Fr. *noumène* (-al); Ital. *numeno*. The object of pure thought, or of rational intuition, free from all elements of sense. See PHENOMENON, and MUNDUS INTELLIGIBILIS.

Plato uses the term a number of times, but simply in connection with *νοῦς* and *νοεῖν*, as

the intelligible, the things of thought, e.g. *Parmenides*, 132; *Republic*, vi. 508.

Kant uses the term generally as equivalent with thing-in-itself; that is, the thing, as *not* object of sense; and hence as something which can only be thought. But in his *Dialectic* he ascribes to thought, as over and above sensuous schematism, specific functions; namely, (1) to limit the world of sense and phenomena, by making us aware of a possible world of reality beyond; (2) to afford an ideal of totality, which can, indeed, never be realized, but which serves, none the less, as a standard to suggest and to regulate, so as to give the greatest possible completeness to experience. For this Kant uses, indeed, the term *idea* rather than *noumenon*, but as its basis of definition is exactly the same (the reference to reason transcending experience), it was impossible that the two should not be confused. Through the practical Reason, the world of *Noumena*, or Things-in-themselves, thus left open as a theoretical possibility, is found to be a practical reality in the consciousness of duty. And in the *Critique of Judgment*, the teleological principle lying at the basis of science mediates between the noumenal and the phenomenal, not indeed asserting the existence of the former, but treating the latter as if the noumenal were its ground. It was the aim of Fichte and of Kant's successors to combine systematically the objective sense of noumenon, the thing-in-itself, and the subjective—the ideal of knowledge—which Kant had brought together only in a confused way. Reinhold is conscious of this confusion, and accordingly carefully discriminates the thing-in-itself, as the source of the 'matter' of our perceptions, from the noumenon, as denoting the unrealizable ideals and problems which thought sets to experience. The thing-in-itself here has more kinship with phenomena than with noumena. See Kant, *Critique of Pure Reason*, 217–26, 249–52 (Max Müller's trans.); *Proleg.*, §§ 44, 57 (in this latter, the three meanings of thing-in-itself, limit to sensibility, and ideal of rational completeness are practically identified); *Critique of Practical Reason*, Bk. I. chap. i. Pt. II; *Critique of Judgment*, 427–8 (Bernard's trans.). Kant seems to have used the term as equivalent to the ancient *νοητά*, which was opposed to *αἰσθητά*. According to Vaihinger (*Commentar zu Kant*, 117) Kant was indebted especially to Sextus Empiricus. For Reinhold, see Erdmann, ii. 479.

Nous [Gr. *νοῦς*, reason, thought]: Ger. *Nus* (K.G.); Fr. *intelligence*; Ital. *nous*. Reason, thought, considered not as subjective, nor as a mere psychic entity, but as having an objective, especially a teleological, significance.

We owe the term, as a technical one, to Anaxagoras. He felt the need of a special principle to account for the order of the universe and so, besides the infinity of simple qualities, assumed a distinct principle, which, however, was still regarded as material, being only lighter and finer than the others. To it, however, greater activity was ascribed, and it acted according to ends, not merely according to mechanical impact, thus giving movement, unity, and system to what had previously been a disordered jumble of inert elements. It is probable, however, that he limited its importance to the stellar heavens; or, at least, used it only when mechanical principles failed. Diogenes of Apollonia identified nous with air, and extended its action to organic bodies. Plato generalized the nous of Anaxagoras, proclaiming the necessity of a rational (teleological) explanation of all natural processes, and making nous also a thoroughly immaterial principle. As the principle which lays down ends, nous is also the Supreme Good, the source of all other ends and aims; as such it is the supreme principle of all the ideas. It thus gets an ethical and logical connotation as well as a cosmological.

On the other hand, nous gets a psychological significance as the highest form of mental insight, the immediate and absolutely assured knowledge of rational things. (Knowledge and the object of knowledge are thus essentially one.) Here *νοῦς* is distinguished from *διάνοια* (sometimes called *ἐπιστήμη*, and sometimes *τέχνη*), which is discursive knowledge, and hence dependent upon assumptions, which cease to be such (and hence are unproved hypotheses) until carried back to the self-evident things of reason. Aristotle continues this line of thought, and practically identifies *νοῦς* as the supreme end, and thus the unmoved mover, or source of all motion, with God, whose activity is *νόησις νοήσεως*, the thinking of thought; an expression which makes explicit and absolute the virtual assumption of Plato regarding the unity of *νοῦς* as faculty of highest knowledge and the *νοητόν* as the supreme object of knowledge. This divine nous is transcendent, moving the world only teleologically, not immanently nor yet causally. As transcendent it is, while

immanent in human beings, yet separable from the body (*χωριστός*) and, as such, imperishable. In man, however, the *vous* assumes a dual form: the active (*vous ποιητικός*), which is free and the source of all man's insight and virtue that links him to the divine (*θεωρεῖν*), and the passive (*vous παθητικός*), which includes thoughts that are dependent upon perception, memory—experience as mediated through any bodily organ. Some of the Peripatetic followers of Aristotle, such as Theophrastus and Strato, appear (like his later Arabian followers) to have denied the transcendence of nous, to have given it a material and sensuous colouring, and thus to have prepared the way for the Stoics. It is with the Neo-Platonists, however, that the conception of nous becomes all-important again. The Absolute is, indeed, above all distinctions, and so cannot be regarded as, in itself, conscious or as reason. But its first distinction is into nous on one side, and being on the other. Nous thus becomes the conception for the absolute reason and subject. Moreover, it possesses a dynamic and self-differentiating quality, and is thus plural (*voi*) as well as singular. As noi it is the source of all the dynamic principles which operate in the creation of the universe. With the Neo-Platonists the conception reaches its zenith. The distinction (of Kant, but particularly as used by Coleridge) of REASON from UNDERSTANDING (q. v.) may, however, be compared with it, but the modern distinction of the subjective from the objective inevitably gives reason a much more psychological sense than nous possessed with the ancients.

Literature: PLATO, *Phaedo*, 97; *Republic*, vi. 508; and *Sophist*, 254; ARISTOTLE, *Metaphysics*, i. 3, 984; SIMPLICIUS, *Phys.*, 33, and 225 a; PLOTINUS, *Enneads*; ZELLER, *Philos. d. Griechen*, ii. 590-2, iii. 512, 528-9. (J.D.)

Novation (in law) [Lat. *novatio*, a renovation]: Ger. *Umschaffung*, *Novation*, *Neuerungsvertrag*; Fr. *novation*; Ital. *novazione*. The substitution, by mutual consent, of a new obligation for an old one.

It may be a new obligation of the same party, or an obligation of a third party. In either case the old obligation is extinguished. If the obligation of a third party be substituted, he must consent to the arrangement.

'Novatio est prioris debiti in aliam obligationem vel civilem vel naturalem transfusio atque translatio: hoc est, cum ex praecedenti

causa ita nova constituatur, ut prior perimatur. Novatio enim a novo nomen accepit, et a nova obligatione' (*Dig.*, xlv. 2, *De Novationibus et Delegationibus*). Cf. Gaius, *Commentaries*, iii. 176.

Literature: a compendious discussion of the subject is to be found in Holtzendorff's *Encyc. d. Rechtsw.*, sub verbo. (S.E.B.)

Now: see PRESENT (specious), and TIME (perception of).

Nucleus [Lat. *nucleus*, a kernel]: Ger. (1) *Zellkern*, (2) *Kern*; Fr. *noyau*; Ital. *nucleo*. (1) The functional and structural centre of a CELL (q. v.). The structure which seems in some way to dominate the vital processes of the cell.

(2) Often used also for cell clusters within the central nervous system.

The second use of the term, though ambiguous, is strongly entrenched in the prevalent usage. Nidus and nidulus have been proposed instead.

With reference to their fibrous connections we distinguish nuclei of origin from terminal nuclei, the former originative, the latter receptive. Thus the primary nuclei of the motor nerves are nuclei of origin, those of the sensory nerves terminal nuclei with reference to those nerves. Practically every nucleus belongs to both classes, and will receive one or the other name according to whether the cellipetal or the cellifugal impulses are considered. (H.H.)

Nullibrists: Ger. *Nullibristen* (Eisler); (not in use in the other languages). A term applied to those who deny that the soul exists in space, since it is simple and immaterial.

Used by Henry More (*Enchir. met.*, 27, 1). It has no currency. (J.D.)

Number [Lat. *numerus*, through the French]: Ger. *Zahl*; Fr. *nombre*; Ital. *numero*. How many; cf. NUMBER CONCEPT. (J.M.B.—G.F.S.)

(1) We think of certain designated things as constituting a 'group' or 'assemblage,' whenever, without ignoring the separateness of the things from one another, we separate them from all other things, not individually, but as a whole, and thus make them collectively a single object of our attention.

(2) Let us call two groups of things 'equivalent,' when it is possible to bring the elements of the one into a relation of one-to-one correspondence with the elements of the other.

Thus the groups of letters, *A, B, C, D*, and *E, F, G, H*, are equivalent, since by matching *A* with *E*, *B* with *F*, *C* with *G*, and *D* with *H*,

we are able to set up a relation of one-to-one correspondence between them.

(3) We may think of all possible groups of things as distributed into *classes* of equivalent groups. A relation of one-to-one correspondence may be established between every two groups which belong to the same class, but not between two groups which belong to different classes.

The property which is common to all groups which belong to the same class, and which distinguishes the groups of one class from those of another class, is the number of things in a group, or its cardinal number. In other words :

The cardinal number of any group of distinct things is that property which is common to the group itself and every group which can be brought into a relation of one-to-one correspondence with it.

Thus the number of things in a group may be described as the fundamental 'invariantive' property of the group, that is, as the property which remains unchanged during all changes (transformations) to which the group may be subjected, except such as affect the distinctness of the things themselves or their common distinctness from all other things.

(4) A 'finite' group may be defined as a group which is equivalent to no one of its parts.

From this definition it follows that if the first of two finite groups be equivalent to a part of the second, the second cannot be equivalent to the first or to any part of the first.

Let M and N represent any two finite groups. It must be the case that—

either (i.) M is equivalent to N ,

or (ii.) M is equivalent to a part of N ,

or (iii.) N is equivalent to a part of M ;

and, as we have just seen, these three cases are mutually exclusive.

In the case (i.) M and N have the same cardinal number. In the case (ii.) we say that the cardinal number of M is 'less than' that of N ; in the case (iii.) that the cardinal number of M is 'greater than' that of N .

(5) By starting with a group which contains but one thing, and repeatedly adding one new thing, we arrive at the following scheme of the cardinal numbers:—

(i.) The cardinal number of a group like I, which contains but a single element;

(ii.) The cardinal number of a group like II, obtained by adding a single element to a group of the first kind;

(iii.) The cardinal number of a group like III, obtained by adding a single element to a group of the second kind; and so on, indefinitely.

It can be shown to follow from (4) that every cardinal contained in this scheme is finite, that every finite cardinal is included in the scheme, and that no two of these cardinals are equal.

Moreover, as thus arranged, the cardinal numbers constitute a never-ending 'ordinal system,' each cardinal following every lesser and preceding every greater cardinal.

(6) If a relation of one-to-one correspondence can be set up between two groups, either group may be used as a 'numeral symbol' for the other; for the two groups have the same cardinal number, and, generally speaking, no other property in common.

The primitive numeral symbols were groups of fingers or of marks, such as I, II, III, . . ., standing in this relation of one-to-one correspondence to the groups which they represent numerically. These are natural or immediate numeral symbols, but they are serviceable for the smaller cardinals only. The more highly developed races have therefore devised various artificial methods of representing the cardinal numbers, by systems of numeral words, as 'one,' 'two,' 'three,' &c., or conventional symbols, as 1, 2, 3, &c. These are the so-called 'natural numbers.'

(7) Arranging these symbols in an order corresponding to that already given the cardinals themselves, we have the never-ending scheme: 1, 2, 3, 4, . . ., which is sometimes called the 'scale of the natural numbers.'

All relations of greater and less among the cardinals are indicated by the relative positions of the corresponding symbols in this scale.

(8) Arithmetic is concerned primarily with the relations which exist among the natural numbers, and with certain operations by which these numbers may be combined.

The operation which lies at the basis of arithmetic is 'counting.'

We count a group of things by bringing it into a relation of one-to-one correspondence with a group of fingers or with a part of the natural scale. The process leads to the knowledge of the cardinal number of the group by yielding a familiar symbol for this number—in the one case a finger-symbol, in the other the last of the numeral words 'one,' 'two,' 'three,' &c., used in the count.

It can readily be shown to follow from the definition of finite group (4) that the result

of counting such a group is independent of the order in which the count is made.

This may be regarded as the fundamental theorem of arithmetic. The various operations of arithmetic all stand in a more or less immediate relation to counting. Thus, addition is an abbreviated form of counting, and subtraction is the inverse of addition; multiplication is an abbreviated form of addition, and division the inverse of multiplication. We are speaking, of course, of the primary meanings of these operations, when both the numbers which they combine, and the results of the combinations, are *natural numbers*.

(9) Thus far we have been considering the natural numbers only. But the complete number-system of arithmetic, algebra, and analysis also includes several classes of 'artificial' numbers: the negative, fractional, irrational, and imaginary numbers. These numbers were invented to express relations not immediately expressible in terms of the natural numbers; but they may be defined independently of such relations, by generalizing the ordinal property of the natural number-system.

(10) First of all we enlarge the natural scale 1, 2, 3, . . . into a scale on which it is possible to count backward with the same freedom as forward, by inventing the new numbers: 0, -1, -2, &c., and placing 0 before 1, -1 before 0, -2 before -1, &c. The new numbers are thus *defined ordinally*, each being characterized by its position in the enlarged ordinal scale.

(11) Next we invent the *fractions*, defining them *ordinally* as follows:

Combine any live natural numbers a and b to form the symbol $\frac{a}{b}$. Read simply 'a over b.'

In particular, let $\frac{a}{1} = a$.

Then arrange all possible symbols of this form ordinally in accordance with the rule:

' $\frac{a}{b}$ shall precede, follow, or coincide with $\frac{c}{d}$ according as ad precedes, follows, or coincides with bc .'

The integral and fractional numbers, positive, negative, and 0, together constitute the 'rational' number system. This system possesses a property not belonging to the natural system: viz. between every two numbers of the system there are other numbers of the system.

(12) We can, in various ways, separate all the numbers of the rational system into two classes, C_1 and C_2 , so related that—

(i.) Each number in C_1 is less than (i.e. precedes) every number in C_2 .

(ii.) There is no greatest (last) number in C_1 , and no least (first) number in C_2 .

We obtain such a separation, for instance, if we assign to C_1 all numbers whose cubes are less than 2, and to C_2 all numbers whose cubes are greater than 2.

Corresponding to every such separation we invent a new number, called an *irrational number* (e.g. $\sqrt[3]{2}$), assigning it a place after all numbers in C_1 and before all numbers in C_2 , and so defining it ordinally.

The rational and irrational numbers together constitute the 'real' number system. This system is 'continuous'; see CONTINUITY (in geometry).

(13) Finally, we add to the number system a new unit i , such that $i^2 = -1$, and then create a new continuous ordinal system (the system of 'pure imaginary numbers') in which the relative positions of any two numbers ai and bi are the same as that of the numbers a and b in the system of real numbers.

The real and imaginary numbers are combined by 'addition' into numbers of the form $a + ib$, called 'complex numbers,' and the complete number-system of analysis consists of all possible numbers of this form.

(14) The operations by which the natural numbers may be combined have experienced a corresponding generalization. But the generalized addition and multiplication are, like the addition and multiplication of the natural numbers, characterized by conformity to the laws:

$$\begin{aligned} a + b &= b + a \\ a + (b + c) &= (a + b) + c \\ ab &= ba \\ a(bc) &= (ab)c \\ a(b + c) &= ab + ac; \end{aligned}$$

subtraction is still the inverse of addition, division the inverse of multiplication, &c.

(15) In conclusion, we may call attention to two further extensions of the number-concept:

(i.) By the creation of complex numbers involving other fundamental units than 1 and i (Hamilton's *Quaternions*, Grassmann's *Ausdehnungslehre*, &c.).

(ii.) By the creation of transfinite cardinal and ordinal numbers (Georg Cantor). (H.B.F.)

Annalen, xlv. 489; DEDEKIND, *Essays on Number* (Eng. trans., 1901), comprising trans. of *Irrationale Zahlen* and *Was sind und was sollen die Zahlen?* (in which the cardinal attribute of number is derived from the ordinal attribute); in the same connection see papers by HELMHOLTZ and KRONECKER in the volume commemorative of the Zeller-Jubiläum; various articles in recent volumes of the *Rev. de Mét. et de Mor.*, by COUTERAT, POINCARÉ, and others; PEIRCE, *Proc. Amer. Acad. Arts and Sci.*, Sept. 10, 1867; and *Amer. J. of Math.*, iv. 85 (1881); H. B. FINE, *The Number System of Algebra*; and *College Algebra* (1901); WALTER BRIX, *Der mathematische Zahlbegriff*, in *Philos. Stud.*, v and vi. (H.B.F.—J.M.B.)

Number (in metaphysics). According to the Pythagoreans, numbers constituted the essence or reality of things. They were the first and ultimate elements out of which things are composed. Plato in his later doctrine (taught orally) seems to have called the Ideas numbers. The Neo-Platonists and Neo-Pythagoreans regarded metaphysical numbers as the archetypes of arithmetical numbers, and the animating principles of things. See ONE (the).

Nicholas Cusanus and the Platonists of the early Renaissance gave great place to number in their cosmologies, being clearly influenced by the new mathematical developments. The mystics have in all ages given importance to numbers and their relations, as either prototypes or symbols of the deepest things in experience. Three (the union of the odd and even), four (the first square), seven (the sum of four and three), twelve (the product of three and four) have been especially honoured. (J.D.)

Number Concept: Ger. *Zahlbegriff*; Fr. *concept* (or *idée*) *de nombre*; Ital. *concetto di numero*. The thought of plurality or manyness, abstracted from the particular determinations indicated by 'how many,' 'so many,' &c., and from any definite arrangement or order.

The number concept involves on this definition: (1) reference to a group of objects considered as having some sort of connection with one another; (2) complete abstraction from the characteristics which distinguish these objects from one another; (3) the thought of the objects as distinguishable and capable of being variously and indifferently grouped and arranged. (G.F.S.—J.M.B.)

This analysis of the number concept is in

fundamental accord with the theory of NUMBER (q.v.). The apprehension of GROUP (q.v.) precedes that of number, and the comparison of groups gives the 'more' or 'less' which is the first stage in the genesis of the number concept (see below). It involves the notion of the substitution of equal groups for one another and of like individuals within the same group. The idea of one-to-one correspondence of the groups *inter se* is a second step, by which mere inequality of groups gives place to numerical more or less, expressed by units. The third stage or step is reached when the notion of substitution becomes that of rearrangement of neutral units within the group itself, together with possible interchange of units from group to group. This is made possible by abstraction from the concrete characters of the members of both groups. It is probable that in this latest stage the device of measurement enters; by it a single constant unit is held for one-to-one comparison with members of the group (or determines such units in a continuous magnitude). But the use of measurement involves the earlier stages of the number concept, since the unit of measurement is itself a numerical abstraction. For a theory which derives the number concept from a form of rudimentary measurement see McLennan and Dewey, as cited below.

Genetically, it is likely that the struggle to accommodate to situations involving groups of objects precipitates comparisons of quantity and size, and this in turn yields a rudimentary sense of number. The writer's child H. for a considerable period distinguished 'one' from 'too-free' (two-three: a general term for plurality), but did not further distinguish different cases of plurality. The conception of unity probably does not arise until from the treatment of various inequalities of groups (possibly the most favourable case is that of *greater and smaller occurring together*, with reference to a familiar group which lies between them) 'two' and 'three' are distinguished from each other and also from 'one.'

The necessity of abstracting from the concrete characters of objects is seen in the difficulty in counting found by primitive peoples who have no adequate abstract symbols. The fingers seem to have served as counting instruments in many cases and to have been represented in pictographic signs. Early peoples, however, seem to have reckoned, as in the payment of debts (expressed

in number of objects, such as cattle), *in kind* — sheep for sheep, oxen for oxen, &c. This shows the number concept still lacking in completeness; the one-to-one correspondence has been reached, but not the idea of abstract substitution of units as between different groups.

Literature: DEDEKIND, Was sind und was sollen die Zahlen?; RIEHL, Philos. Krit., II. i. 73; WUNDT, Logik, i. 468; SCHUPPE, Logik, 102; JERUSALEM, Die Urtheilsfunction, 254; McLENNAN and DEWEY, The Psychol. of Number. (J.M.B., G.F.S.)

Number Form: Ger. *Zifferform*; Fr. *schème* (or *diagramme*) *numérique*; Ital. *schema numerale*. The form of SYNAESTHESIA (q.v.) in which the digit numbers and their combinations are given a scheme or arrangement in space by a manner of imaging peculiar and necessary to the individual.

The term is extended also to similar forms for other series, such as the letters of the alphabet, the months of the year, &c. For illustrations see SYNAESTHESIA. (J.M.B.)

Numenius. Born in the latter half of the 2nd century A.D. in Apamea, Syria. A Neo-Pythagorean who prepared the way for Neo-Platonism.

Numerical [Lat. *numerus*, number]: Ger. *Zahl-* (in compounds, as *Zahldifferenz*); Fr. *numérique*; Ital. *numerico*, *numerale*. If two bodies move in the same orbit and differ in no respect but that of being at any one instant in different places, they are said to be numerically different. Whether or not it is quite accurate to say that they differ only in this, that there are two of them, it is sufficiently so to account for the origin of the phrase. Numerical difference is individual difference, apart from all qualitative unlikeness. Numerical identity is being strictly the same

individual. Cf. the different topics IDENTITY, DIFFERENCE, and INDIVIDUAL.

This adjective in logical phrases usually translates the Greek *ἀριθμητός*. Some writers have doubted whether the Greek word is here to be understood in an arithmetical sense, and have seemed to suspect that it was a relic of some original and different signification of the word. But this is hardly called for.

A numerically definite syllogism is one the force of which depends upon the relations of numbers; as 'Most of the men at a certain gathering wore dress-coats, and most of them had white neckties. Hence, some of those who wore dress-coats had white neckties.' (C.S.P.)

Nutrition [Lat. *nutritio*, a nourishing]: Ger. *Ernährung*; Fr. *nutrition*; Ital. *nutrizione*. (1) The series of vital processes by which living organisms transform food materials into the substances of their own bodies: anabolic processes. See ANABOLISM.

(2) Substances capable of thus being transformed into living tissues, nutriment. (C.F.H.)

Nyāya Philosophy: see ORIENTAL PHILOSOPHY (India).

Nyctalopia: see HEMERALOPIA, DAY-BLINDNESS, and NIGHT-BLINDNESS.

Nymphomania [Gr. *νύμφη*, a nymph, a bride, + *μανία*, madness]: Ger. *Nymphomanie*; Fr. *nymphomanie*; Ital. *ninfomania*. A morbid and uncontrollable sexual desire in woman (in man termed Satyriasis).

It appears as a symptom in various mental disorders, but particularly in acute mania, and at times forms the chief indication or the initial symptom of such disorder. Nymphomania refers particularly to the morbid passion for sexual intercourse, while Erotomania refers to the excessive mental concentration on ideas concerning love, courtship, and mating. (J.J.)

O

O — OBJECT

O (in logic). Symbol for the particular negative judgment — Some men are not white. Cf. A. (J.M.B.)

Obedience and **Disobedience** [Lat. *obediens*, from *obedire*, to obey]: Ger. *Gehorsam*, *Ungehorsam*; Fr. *obéissance*, *désobéissance*; Ital. *ubbidienza*, *disubbidienza*. Obedience is personal submission in intention and action to an authority imposed upon the individual; disobedience is intentional refusal or omission of such submission. If the authority be to something internal, it is still recognized as quasi-external or not self-imposed: so Socrates' obedience to his Demon, and St. Paul's to his 'heavenly vision.'

Obedience is a recognized factor in the training and also in the development of the social nature of the child. In education the question has been as to how far obedience can be inculcated by the enforcement of commands. In social psychology obedience has been recognized as an important factor in what has been called social HEREDITY (q.v.); and Bain makes it a schoolmaster to morality — the obedience to a 'word of command' standing for and anticipating the recognition of the moral law. (J.M.B.)

Object (-ive; general and philosophical) [Lat. *ob*, off, over against, + *iacere*, to throw, to lie; the equivalent of Gr. *ἀντικείμενον*, usually translated *oppositum*]: Ger. *Gegenstand*, *gegenständlich*, *Objekt*, *objektiv*; Fr. *objet*, *objectif*; Ital. *obbietto*, *oggetto*, *obbiettivo*. (1) That in which the mind's activity terminates; that towards which any mental operation is directed. But since the TERMINUS (q.v.) of intellect and of volition may be distinguished, this most general sense easily breaks up into two

others. (2) That which is known, considered as giving truth and reality to the knowing process. (3) That which is the goal of impulse or choice—aim, end, ultimate purpose. But since the problem of knowledge has been chiefly as to how the external world may be known (knowledge of states of consciousness being taken as a matter of course), (4) object is often used popularly to mean 'thing.' (5) Combining with the philosophical sense, it then is set over against mind and consciousness as the external, often the material, world. This tendency is strengthened by the use of the word SUBJECT (q.v.) to denote mind, and is one of the two chief meanings of the adjective objective. (6) That which is known may also be distinguished from that which is only erroneously assumed or accepted—from that which we deceive ourselves into believing; hence object is used as equivalent to real. This sense is not common with the noun, but is most frequent with the adjective objective, which designates that which belongs really to any subject-matter as distinct from that which is imported or reflected into it through the prejudices, illusions, fallacies, or errors of the person observing or judging: opposed to that which is *merely* in the mind. It is (2) above made more specific. (7) Objective then comes to mean the intrinsically real, or self-subsistent, having validity in itself—e.g. 'duty is objective.' (8) In later scholastic philosophy, object and objective are used exclusively to denote that which exists simply and only as material of mental operations. The use is continued in Descartes and is found in Berkeley, who expressly calls the existence of objects *as perceived* their objective existence.

The history of the transformation of this earlier meaning to the later ones will be found under SUBJECT. Cf. the next topic. (J.D.)

Literature: EUCKEN, *Gesch. d. philos. Terminol.*; thirty pages of citations in EISLER, *Wörterb. d. philos. Begriffe*. (J.M.B.)

Object (mental or psychic): Ger. *Objekt*; Fr. *objet*; Ital. *obbietto*. Whatever consciousness in any way cognizes or, cognizing, feels any kind of interest in.

The flight of a bird, the immortality of the soul, the ultimate constitution of matter, a man's personal identity, a toothache, an algebraic equation, social reform, the moral ideal—all these are objects if and so far as anybody attends to them. The definition indicates a distinction between objects of interest and objects of cognition. But in ultimate analysis it would seem that knowing never takes place without some interest in the object, and evidently we cannot be interested in anything without having some cognizance of it, however vague and rudimentary. Objects as such exist for us only so far as we attend to them. But when we attend there is always some need, craving, appetite, inclination, whim, or other form of conative tendency, which seeks satisfaction in the object attended to. Cf. OBJECTIVE (in psychology).

It will be noticed that we give the word 'object' the widest possible meaning. Our justification is that for this wide application no other word or form of expression can be conveniently substituted for it. Pikler (*The Psychology of Belief in Objective Existence*) uses the term *obiectiva* where we should speak of objects. But there is no need for introducing a Latin word where a common and familiar English term is available. There is, however, a tendency in some writers to limit the application of the term to material objects. But there is no sufficient ground for this restriction. If we use the term for any object of consciousness, whatever its nature may be, we can easily indicate when we wish to refer to 'material objects' by calling them material. In the same way we can speak of psychological objects, mathematical objects, ethical objects, and so on. Cf. OBJECT AND OBJECTIVE. For the self considered as object see SELF, and REFLECTION. (G.F.S., J.M.B.)

Object-blindness: Ger. *Seelenblindheit*; Fr. *cécité psychique*; Ital. *cecità psichica (degli oggetti)*. See BLINDNESS (mental).

Object-lesson: Ger. *Anscharungsunterricht*; Fr. *enseignement intuitif, leçons de choses*; Ital. *lezione obbiettiva*. A class-room

exercise upon a concrete object, such as an animal, plant, or mineral.

A course of such lessons was once thought essential to a good school; it is now generally recognized that object-lessons are much more effective when made an early or concrete stage of the regular instruction in the various studies. Cf. OBSERVATION, FORMAL STEPS, and METHOD.

Literature: CALKINS, *Object-lessons*. In Proceedings of the National (U.S.) Educational Association, as follows: SHELDON (1863), 93-102; WILBUR (1864), 189-209; GREENE (1865), 245-70; LOTHROP (1870), 49-64, 155, and (1872), 17; CALKINS, in various volumes since 1872. (C.De G.)

Object Self: see SELF.

Objection [Lat. *obiectus*, from *ob* + *iacere*, to throw]: Ger. (1) *Einwendung (Einwand)*, (2) *Vorwurf*; Fr. *objection*; Ital. *obiezione*. Opposition taking the form of (1) dissent, which is opposition to a truth or proposition, or (2) disapproval, which is practical opposition. The opposing statement, or the ground of opposition, is called 'an objection.' (J.M.B.)

Objective (in psychology): Ger. *Objektiv*; Fr. *objectif*; Ital. *obbiettivo*. Sometimes used as synonymous with physical or material, but for psychological purposes it is better to define as follows: Whatever belongs to the nature of the object as cognized, in distinction from the processes of cognition, feeling, and willing. (G.F.S.—J.M.B.)

The term 'objective' especially indicates the controlling and determining function of the object in relation to subjective process. The object, whether characterized by reality feeling or by explicit belief, prescribes to subjective activity the conditions of its efficiency. Subjective interest seeks satisfaction. But the means by which satisfaction is to be attained can only be revealed by trial. Subjective activity is always a process of experimentation; the result of the experiment depends on the object. It is predetermined by the nature of the object. This holds good whether the satisfaction sought is practical or merely theoretical.

Practical success depends on adjustment to conditions independent of our wish or will. A cat attempting to escape from a cage may claw, bite, push, and pull, now in this direction and now in that. But whether it will escape, and if so, how, is predetermined by the structure of its prison. It can only experiment. A man constructing a piece of machinery for a given purpose must

adjust himself to the nature of his material and its mechanical, physical, and chemical laws. All such activities involve an experimental attitude, and in the result of the experiment the nature of the object is revealed. You take a spade and try to dig. You may at will determine the amount and direction of effort put forth, but the result is beyond your direct control. You cannot by mere subjective selection determine whether the ground shall prove yielding or unyielding, or whether the spade shall break or not.

The outcome of previous activity yields knowledge of the object, which defines and determines subsequent activity. In so far as previous effort is found to fail, new adjustment follows. Unsuccessful lines of action are discontinued or modified, and successful lines maintained and repeated. In this way the development of cognition is one with the development of conation. As knowledge becomes more precise, complete, and differentiated, so activity becomes more precisely, completely, and distinctively adjusted to objective conditions. 'It is the essence of conation to seek its own satisfaction. But success is possible only in so far as it has acquired a definite and determinate character. The more blind a craving or impulse is, the more helpless it is. The new-born infant feels the craving of hunger, and manifests it by diffuse movements and by cries. Its craving is exceedingly indeterminate, inasmuch as it has no cognizance of the special object which would satisfy it or of the means of attaining this object. Hence the felt want cannot work out its own satisfaction. The mother or the nurse must do for it what it cannot do for itself. . . . On the other hand, as a vague craving takes more definite shape, the infant becomes more and more capable of fulfilling its own wants. Throughout this process the original conation is an essential factor. It tends to define itself, and the gradual acquisition of knowledge through experiment is but another expression for the process whereby the originally blind craving becomes more distinct and differentiated. To this growing differentiation and distinctness correspond more and more special and complex movements. Thus the vague craving becomes the relatively definite impulse to suck the breast. Soon the infant, which could not at first find the nipple, points to the bottle. Further development brings preference for this or that kind of food, the use of knife and fork, and the earning of money to buy nourishment'

(Stout, *Analytic Psychol.*, ii. 83 f., somewhat revised).

In principle, what has been said of practical activity applies also to theoretical activity. In practical activity, our interest requires in its gratification the production of some change in the object other than the mere transition from being less known to being more known. On the other hand, theoretical interest is satisfied by a mere increase of knowledge. None the less, it is an interest, just as much as hunger, or thirst, or love of money. And the conditions of its satisfaction are inherent in the nature of its object, and are revealed in the processes of mentally experimenting with the object. If I am curious about the colour and other characters of a bird which happens to catch my eye, I look hard at it, and possibly use a field-glass. But when I thus take the initiative, the result does not depend on me, but on the objective conditions. Perhaps the bird flies away before I can examine it. In that case my curiosity is balked. The end of my activity was merely to have that activity determined and defined by its object. But if the bird flies away, the objective control which I am seeking is denied. If it waits to be scrutinized, the result depends on it, not on me. I want to know whether its breast is black or blue or red. But it is the object itself which decides in favour of one of these alternatives to the exclusion of the others. It is the same with higher processes. I attempt to solve a geometrical problem, and on my own initiative take this or that step. But the result depends not on me, but on the condition of the problem, the nature of space, and so forth. Or I attempt to follow the transitions in Hegel's *Logic*; as Hegel very rightly says, all I have to do is simply to fix my attention on absolutely indeterminate being, with the view of finding it intelligible. It absolutely refuses to be intelligible unless I supplement it with other conceptions. Thus it grows and develops before my eye. But its growth and development arise from its own nature. I only give it an opportunity by setting my attention in a certain direction—by experimenting with it in a certain way. Cf. EXPERIMENTATION, SELECTIVE THINKING, and TRUTH. (G.F.S.)

Objective Right: Ger. *objektives Recht*; Fr. *droit objectif*; Ital. *diritto obbiettivo*. The first stage in the dialectical evolution of morality is, according to Hegel, that of 'Abstract Right.' This stage is otherwise described as 'Objective Right,' in its opposition

to the next stage, that of 'Morality' or 'Subjective Right.' See Hegel, *Rechtsphilos.*, Intro., § 26 (Dyde's trans., 32-4). (J.S.)

Objectivism [for der. see OBJECT]: Ger. *Objectivismus*; Fr. *objectivisme*; Ital. *oggettivismo*. (1) The theory which attributes objective validity to at least some of our ideas, and thus regards the mind as capable of attaining real truth. Opposed to scepticism and to phenomenalism.

(2) The theory which tends to neglect the mental and spiritual in its theory of reality.

(3) The theory, in ethics, which conceives the aim of morality to be the attainment of an objective state (so Külpe, *Intro. to Philos.*, §§ 14 and 30). Cf. SUBJECTIVISM. (J.D.)

'Objectivity' is applied both (1) to products or creations, and (2) to thinkers, artists, agents, &c., which illustrate objectivism in any of these meanings. (J.M.B.)

Objectivity: see OBJECTIVISM.

Obligation (in law) [Lat. *obligare*, to bind]: Ger. (1) *Obligation*, *Schuldverpflichtung*, (2) *Schuldverschreibung*; Fr. *obligation*; Ital. *obbligazione*. (1) A legal duty of one person to do something or abstain from doing something for the benefit of another.

It confers or implies a right to service. In strictness, it implies an actionable right, and thus excludes mere parental obligations (Pollock, *Jurisprudence*, chap. iv. 84).

(2) A writing expressing such a contractual duty, generally under seal.

'*Obligatio est iuris vinculum quo necessitate adstringimur alicuius rei solvendae, secundum nostrae civitatis iura*' (*Inst. of Just.*, iii. 14, *de obligationibus*). The constitution of the United States forbids any state to pass a law impairing the obligation of a contract. A charter of a private corporation is a contract within the meaning of this provision.

Literature: POTHIER, *Obligations*; SAVIGNY, *Das Obligationenrecht*. (S.E.B.)

Obligation (moral): Ger. (*sittliche*) *Verpflichtung*; Fr. *obligation (morale)*; Ital. *obbligazione (morale)*, *obbligò*. That which is binding or authoritative in the nature of morality. (J.S., J.M.B.)

The problem of moral obligation may be said to be the central and all-inclusive problem of ethics—the science of the 'ought' as distinguished from the natural sciences or sciences of what 'is.' Thus Sidgwick says that both ethics and politics are 'distinguished from positive sciences by having as their special and primary object to determine what ought to be, and not to ascertain

what merely is' (*Meth. of Eth.*, 1), since 'the fundamental notion represented by the word "ought" or "right," which is contained expressly or by implication in all ethical judgments, is 'essentially different from all notions representing facts of physical or psychological experience' (*ibid.*, 27). The notion of oughtness or obligatoriness is, on this view, 'ultimate and unanalysable,' unique, the fundamental category of moral judgment; and the function of ethics is to determine the content of obligation: what we ought to do, or what it is reasonable or right to do. The notion of obligation implies, further, a conflict between rational and non-rational motives. 'In fact, this possible conflict of motives seems to be connoted by the term "dictate" or "imperative"; which describes the relation of reason to mere inclinations or non-rational impulses by comparing it to the relation between the will of a superior and the wills of his subordinates' (*ibid.*, 36).

As a specific ethical problem, or as an explicit statement of the ethical problem itself, however, the problem of moral obligation is one that has arisen in modern times. The question of the obligatoriness of certain forms of action is closely connected with that of the authoritativeness of the law which prescribes them. The explicit question, Why ought I to do this or that? arises with the separation of the action, in its formal principle, from the end, of the 'ought' from the 'good.' The Greek moralists asked: What is the good of this or that action?—and so ultimately: What is *the* good? Preoccupied with the beauty and attractiveness of the good, and tending always more or less to a hedonistic interpretation of it, they were not so apt to raise the question of its obligatoriness or imperativeness: the authoritativeness of the good lay in its goodness. Modern moralists, on the other hand, have asked: What ought I to do, and why ought I to do it? What are the true laws of conduct, and what is the source of these laws and of their validity? 'For the ego-centric point of view is substituted the homocentric' (Fonsgrève, *Essai sur le libre arbitre*, 479); for the teleological point of view is substituted the formalistic and the juridical. Further, the homocentric point of view is also, primarily at least, the altruistic. The question is: Why ought I to regard the good of others as well as my own, and at the expense of my own? The problem of moral obligation passes into that of social and political obligation.

Kant's distinction between the categorical imperative of morality and all other imperatives, as merely hypothetical, is epoch-making, and may be regarded as the definitive formulation of the modern, as distinguished from the ancient, view of morality. Still, we cannot say, with Renouvier (*Sci. de la Mor.*, 95), that this Kantian distinction amounts to 'a complete reversal of the ancient point of view of the human mind as to the essence of morality.' For the Greek moralists all imperatives are hypothetical, that is, means to ends, except one, the supreme end itself. It is only because modern moralists, on the contrary, have separated the problem of the ought from that of the good, because they have rested in the conception of the rightness of the actions or in that of their conformity to law, that they have regarded moral imperatives as categorical. Even for Kant the ultimate ground of the categorical character of the imperative of morality is found in the ultimateness of the moral end, in the character of the moral being as an end-in-himself; and the recognition of such an end by the Greek moralists makes the morality, which is the means of its attainment, categorically, and not merely hypothetically, imperative.

The intrinsic inseparableness of the problems of obligation and end, of oughtness and goodness, is suggested by the utilitarian, and often egoistic, solution of the modern problem of duty, as well as by the conception of duty which results from the ancient conception of good. At the same time, important differences result from the difference in starting-point. When this is duty, we are generally offered a doctrine of sanctions, a more or less external interpretation of moral obligation; when this is the good, its obligatoriness is conceived as intrinsic, and is rather an implication than an explicit attribute of morality.

The problem of moral obligation receives two main or typical solutions, and both are found alike in ancient and in modern ethics. The first may be called the rationalistic, the second the hedonistic or utilitarian. Ultimately, it is the difference in the conception of the end or good that determines the difference in the interpretation of obligation. Not only so, but a hedonistic view of the end seems logically to negate obligation as an ultimate category. As Sidgwick says, ethical hedonism is incompatible with psychological hedonism; and hedonism is generally psychological. It seems unmeaning to say that I *ought* to seek happiness—my own, at all events. Accordingly

it is to Kant's anti-hedonism or extreme rationalism that we must trace the intensity of his insistence upon the categorical character of moral obligation, or conversely. It is chiefly to the prevailing hedonism of Greek ethics, on the other hand, that the comparative unimportance of its doctrine of obligation is to be traced. Yet even hedonism has its doctrine of obligation, and in Greek ethics we find rationalism as well as hedonism.

That the virtuous or excellent life, the life which attains the good, is a life 'according to right reason,' is the fundamental conviction not only of Aristotle, but of his predecessors, Socrates and Plato. It is a doctrine common to the Stoics and Epicureans, and finds its earliest philosophical expression in Heraclitus. As a conviction of the ordinary moral consciousness, it is rooted in the Greek regard for reason as the source of order, not merely in human life, but in the universe itself. The 'measure' which is the secret of reality and of beauty, as well as of virtue, is set by reason. All fair and noble activity is subject to the law of reason; the mark of a base and ignoble act is that it transgresses this law. The one has form, the form which reason alone can give; the other is without form, because it is devoid of reason. The fundamental and inclusive virtue is that temperance or moderation which consists in observance of the limit set by reason.

Heraclitus anticipates the Stoics in the explicit assertion of the obligatoriness, for man, of obedience to 'the divine law from which all human laws draw their sustenance,' the law of the common or universal reason, the true 'nature' of man, as of all things. In obedience to this divine law, as contrasted with the promptings of ungoverned appetite, he finds the secret of human happiness.

For Socrates, Plato, and Aristotle alike man is, in his true nature, a rational or reflective being, and his true or characteristic life is, therefore, the rational or reflective life, the life obedient to law, as contrasted with the lawless life of unrestrained animal appetite. For all three philosophers wisdom is, if not the sum, at any rate the presupposition, of virtue. And if Socrates tends to trace the obligatoriness of the rational life to its pleasantness, and to resolve all virtue into prudence, Plato and Aristotle regard it as in itself obligatory upon man as a rational being. The question, Why should I act rationally? is—they would say—a meaningless, because an irrational, question. For both Plato and Aristotle the

completely rational life, the life of reason itself, is the life of thought or philosophy. The life of ordinary human activity has only a secondary or incomplete rationality: it should, or ought to, be a life according to reason. The highest form of this life is found in the state, which is the individual 'writ large.' From the psychological point of view, Plato regards the supreme virtue of righteousness (*dike*) as consisting in the obedience of the spirited (*θυμός*) and appetitive (*ἐπιθυμία*) elements of human nature to the rule of reason (*λόγος*). Righteousness, or complete virtue, consists in the doing of its own proper work by each part of the soul; and reason's work is not merely to rule, as that of impulse is to obey, but, as legislative, to determine the work of the other parts. The obligatoriness of the rational life is implicit in Aristotle's view of human good (*εὐδαιμονία*). This consists in *ἐνέργεια ψυχῆς*, that is, in the actualization of the human (= rational) life-principle or self. Such true self-realization takes various forms in the various rational or excellent human activities and habits, which are all found to be cases of the mean or rational amount.

It is in the ethics of the Stoics, and especially of the Roman Stoics, that the conception of obligation becomes most explicit. The Stoics not only define virtue as living conformably to nature (*ὁμολογουμένως τῇ φύσει ζῆν*), but distinguish two degrees of such conformity: (1) *καθῆκον*, outward conformity or 'fitness'; (2) *κατόρθωμα*, inward conformity or 'rightness.' For the cynic scorn for law as mere convention (*νόμος*) they substitute reverence for it as the expression of the divine order of the universe. The Roman Stoics develop this legalistic conception of life, and especially the idea of the universal validity of social obligation, of that law of nature and of nations which binds together all members of the human race as partakers in a common reason, and makes them citizens of a common state.

The juridical view of morality received a new expression in Christianity. The Jewish rabbis had elaborated a complicated and casuistical interpretation of the divine law. For the outward and mechanical conformity which such a method encouraged, Christianity substituted the inward conformity of will and disposition, demanding righteousness of motive and intention, and not merely of outward act. It also interpreted righteousness, after the manner of the Hebrew prophets, on its social

as well as on its divine side, identifying the love of God with the love of man. In spite, however, of the characteristic inwardness of Christian morality, and of the exaggerated expression of this tendency in the 'antinomianism' of the early Christian centuries, there grew up in the middle ages an elaborate system of ecclesiastical jurisprudence, a new Christian casuistry. Along with this there came to prevail a double standard of virtue and duty, a distinction between ordinary and monastic virtue, between those things which are obligatory upon all (commands) and those things which are merely 'counsels of perfection.' The Reformation marks the revival of the principle of inwardness, of the essential unity and absolute obligatoriness of all virtue, and of the right of the individual conscience to determine for itself all questions of duty.

Modern ethics begins with the effort to discover an independent basis of moral obligation in the nature of things, in reason, divine or human, rather than in the will of God. Grotius defined 'natural right' (*ius naturale*) as 'the dictate of right reason, indicating that an act, from its agreement or disagreement with man's rational and social nature, is morally disgraceful or morally necessary.' Hobbes, while denying that man is by nature a social being, yet recognizes certain 'laws of nature,' and regards certain forms of conduct as indirectly, if not directly, rational. The early British rationalists—Cudworth, More, Cumberland, and Clarke—insist upon the essentially rational, and therefore natural, character of all duty as determined by the immutable and eternal relations of things. They reassert, against Hobbes, the essentially social nature of man and the ultimateness of social obligation. This ethical rationalism is developed by Butler, who finds the seat of authority in the rational principles of human nature, conscience, self-love, and rational benevolence. As a rational being, man is a law unto himself: he has the rule of right within, in the constitution of his own nature, in which the rational or reflective principles are clearly fitted to govern, and the impulsive or unreflective principles to obey. 'We are constituted so as to condemn falsehood, unprovoked violence, injustice, and to approve of benevolence to some preferably to others, abstracted from all consideration which conduct is likeliest to produce an overbalance of happiness or misery.' This doctrine of the intrinsic nature of moral distinctions and obligations is further developed by the later

intuitionists, who maintain the absoluteness and ultimateness, because rationality, of moral principles, and insist upon the authority of conscience as the revealer of such principles.

This rationalistic view of moral obligation has provoked an opposite view, that of the hedonistic or utilitarian school. According to this view, the consciousness of moral obligation is the individual's sense of the compulsoriness of right conduct; the 'ought' is the echo of the 'must.' Its source is to be found, therefore, in the 'sanctions' of such conduct, or in the penalties attached to the violation of moral law. These sanctions are primarily, as in Paley's theory, theological. By later utilitarians they are conceived as the natural consequences of wrong-doing, and more particularly as its social and political consequences, the penalties with which public opinion, whether politically organized or not, visits the transgression of its laws. According to Paley, a man is said to be 'obliged' when he is 'urged by a violent motive resulting from the command of another.' This definition is virtually anticipated by Gay, in his Dissertation prefixed to Law's translation of King's *Origin of Evil* (1731): 'Obligation is the necessity of doing or omitting something in order to be happy. . . . Full and complete obligation, which will extend to all cases, can only be that arising from the authority of God.' To Paley's religious sanction Bentham adds three others, the physical, the political, and the moral or popular. The physical or natural sanction he regards as the basis to which all the others may be reduced. For Mill, as for his predecessors, obligation is synonymous with motivation. His answer to the question, 'What is the source of the obligation of utilitarian morality?' consists in an account of its sanctions. Earlier moralists have erred, he thinks, in limiting themselves to the external sanctions. Far more important than any of these is the internal or psychological sanction, the 'feeling of unity with our fellow men,' the sympathy which binds us to our fellows and constrains us to act for their interest, even at the sacrifice of our own. Mill thus discovers the obligation, in the sense of motivation, of altruistic conduct in an altruistic impulse which is irreducible to terms of egoism; while, in his insistence upon the intrinsic superiority of certain pleasures or satisfactions, and upon the right of the 'higher' feelings to control the 'lower,' he commits himself implicitly to a doctrine of obligation of the rationalistic type.

The evolutionary utilitarians seek to account for the feeling of obligation by tracing its genesis. According to Spencer, the political, religious, and social controls are only the pre-moral controls within which the strictly moral control evolves, and from which it gradually emancipates itself. The former account for the coercive element in obligation; the latter constitutes the authoritative element, and consists in the consciousness of the intrinsic evolutionary superiority of the more complex, representative, and later-evolved feelings as principles of conduct, to the simpler, presentative, and earlier evolved. With moral progress, the consciousness of obligation, in the former sense, tends to disappear, giving place to spontaneity. Of this evolutionary or naturalistic view of moral obligation an extreme statement will be found in Guyau's *Esquisse d'une Morale sans Obligation, ni Sanction*.

As against the hedonistic and utilitarian interpretation of obligation, the rationalistic view has been reasserted by modern idealists, first in Germany and later in England and America. For Kant, the founder of this idealistic movement, all morality is summed up in the word duty, and in a sense which negates pleasure and disregards consequences. Duty is a matter not of act, but of motive. The good or dutiful will is the will that is moved simply by reverence for law, or for its own rational nature. Such a will is autonomous, a law unto itself, because an end-in-itself. For Hegel this subjective or 'conscientious' attitude is only a stage between 'abstract right,' or external legality, and that 'ethicality' in which the individual recognizes his unity with his fellows, and sees in the ethical institutions—the family, society, and the state—the concrete and objective expression of the universal reason and the ultimate ground of individual obligation. The latter view has found expression in Green's *Prolegomena to Ethics*, Bradley's *Ethical Studies*, and more recent works in English which, while reducing all specific duties to the fundamental duty of self-realization, yet, by interpreting the true or ideal self as the social self to which the lower and false, or merely individual and selfish, self ought to be sacrificed, emphasize the social aspect of moral obligation. This has also been emphasized, from the psychological point of view, by Bain, Baldwin, and others. Cf. ETHICS, ETHICAL THEORIES, DUTY, LAW, and SANCTION.

Literature: GEORGES FULLIQUET, *Essai*

sur l'Obligation morale (1898); FRED BON, *Über das Sollen u. das Gute* (1898); J. MARK BALDWIN, *Social and Eth. Interpret.* (1898); works on Ethics generally; BIBLIOG. F, 2, j. (J.S.)

Obscurantism [Lat. *obscurare*, to darken]: Ger. *Obscurantismus*; Fr. *obscurantisme*; Ital. *oscurantismo*. Opposition to intellectual progress or enlightenment arising out of ignorance or fear of the effects which enlightenment will produce on traditional institutions and beliefs; the principles of those who practise such opposition. (A.T.O.)

Observation [Lat. *observatio*, from *observare*, to look at]: Ger. *Beobachtung*; Fr. *observation*; Ital. *osservazione*. Attentive experience; especially, an act of voluntarily attentive experience, usually with some, often with great, effort. Cf. the following topics.

More or less fixity in the object is requisite. Indeed, experience supposes that its object reacts upon us with some strength, much or little, so that it has a certain grade of reality or independence of our cognitive exertion. All reasoning whatever has observation as its most essential part. Whatever else there is in the act of reasoning is only preparatory to observation, like the manipulation of a physical experiment.

Much stress has been laid upon the distinction between 'sciences of observation' and 'sciences of experiment'; and undoubtedly there is a great contrast between the proceedings, let us say, of the anatomist and of the physiologist. Although the anatomist has to make many experiments (with stains, for example), yet the stress of his labour comes upon the act of observation; while the preparations for observation of the physiologist are far more elaborate, and the mere act of observation itself often very easy and coarse. The difference is, however, chiefly one of degree, and from a philosophical point of view is of quite secondary importance. (C.S.P., J.M.B.)

Observation (errors of): see ERRORS OF OBSERVATION.

Observation (mental): Ger. *Selbst- (or innerliche) Beobachtung*; Fr. *observation de soi*; Ital. *osservazione (interna, also introspezione)*. (1) The deliberate examination of what is in one's own mind, with consciousness of the act itself; called 'self' or 'inner' OBSERVATION (q. v.). Cf. REFLECTION.

The term thus defined is useful to indicate reflection for purposes of examination, and not merely as designating the reflective state of mind in general. One observes when he

reflects, but when he observes he reflects for a purpose. Observation is the means of INTROSPECTION (q. v.).

(2) A second use (which is not recommended) makes observation synonymous with mere awareness of the progress of experience.

Literature: JAMES, *Princ. of Psychol.*, i. chap. vii; BRENTANO, *Psychologie*; LADD, *Psychol., Descrip. and Explan.*, chaps. i, ii. (J.M.B.—G.F.S.)

Observation (method of, in education). The acquisition of knowledge by direct sense-perception.

At one time teachers were inclined to regard observation as a method complete in itself, programmes being supplied with courses of so-called object-lessons. Educators are now disposed to view observation as but one step or stage in a rational method. This is, at all events, the position of the Herbartians. See METHOD, and INTUITION (in education).

Literature: Index to Proceedings of the National (U.S.) Educational Association; N.A. CALKINS, *Object Lessons*. (C.De G.)

Observations (adjustment of): Ger. *Beobachtungsrechnung*; Fr. *calcul des observations*; Ital. *ordinamento dei risultati d'osservazione* (suggested—E.M.). The department of experimental or scientific method concerned with the treatment of experimental results to determine their evidential value.

The method of procedure in adjusting the results of a series of observations depends upon the nature of the particular problem had in view. The number and distribution of cases, the ERRORS OF OBSERVATION (q. v.) of various sorts, the comparison of the results of one series with another, the elimination of accidental cases or of those vitiated by this condition or that—these are some of the questions concerning which exact analysis is required. An illustration of such adjustment of observations is presented under VARIATION (statistical treatment of). In many cases the application of the theory of PROBABILITY (q. v.) is demanded. (J.M.B.)

Observer: see SUBJECT (of experiment).

Obsession [Lat. *obsessio*, a besieging]: Ger. *Besessenheit*; Fr. *obsession*; Ital. *ossessione, fissazione*. (1) The explanation of marked neurotic and abnormal mental symptoms in a patient as due to the persevering efforts of an evil spirit to gain mastery over him.

It differs from POSSESSION (q. v., as also DEMONOMANIA) in that it emphasizes the efforts of the demon from without, while in possession the demon is supposed actually to

be resident in the body, and must accordingly be exorcized by appropriate agencies.

(2) The persistent and irresistible presence of an idea or emotion; in this sense equivalent to an IMPERATIVE IDEA (q. v.). (J.J.)

Obversion [Lat. *obversio*, a turning]. Hamilton (*Lect. on Logic*, xiv, and especially Appendix V. iii) states that CONVERSION (q. v., also for foreign equivalents) in logic is sometimes called obversion.

This is a surprising statement, which neither he nor his editors are able to support by citations. It is, therefore, not unlikely that Hamilton took it at second hand.

Bain (*Logic*, Pt. I. Bk. I. chap. iii. § 27) says: 'In affirming one thing, we must be prepared to deny the opposite: "the road is level," "it is not inclined," are not two facts, but the same fact from its other side. This process is called obversion.' Bain gives no reference. The regular scholastic name for the process he describes—a name given by Abelard (*Dialectica*, 225)—is *infinitatio*. This word is very common (see, for example, Albertus Magnus in II. *Peri hermeneias*, iii; Ockham, *Logica*, II. xii, xiii; and the index to Prantl, *Logik*, iv). But somebody may have got the notion that it was 'barbarous,' and have preferred to use a more classical-sounding designation. (C.S.P.)

Occam (or **Ockham**), **William of**; so called from Ockham, England. Studied at Merton College, Oxford; became a Franciscan, 1319, and then studied at Paris under Duns Scotus. He became the most eminent of Nominalists. He opposed the pretensions of the pope to political power and the possession of property. He was finally summoned to trial, and took refuge (1328) with Emperor Louis of Bavaria. He never signed the article of recantation, although he sought peace with the pope late in life. He died in 1347. See OCCAMISM.

Occamism: Ger. *Occamismus*; Fr. *doctrine d'Occam*; Ital. *dottrina di Occam*. The doctrine held by the followers of William of Occam, the founder of scholastic Nominalism (see REALISM). They were also called Terminists, because of the doctrine of Occam that universals are not anything really existing, but are only *termini*, predicables. (J.D.)

Occam's Razor: see PARSIMONY.

Occasion (-al): see OCCASIONALISM, and CAUSE.

Occasional Cause: see OCCASIONALISM.

Occasionalism [Lat. *occasio*, an event]: Ger. *Occasionalismus*, *Theorie der Gelegenheitsursache* (occasional cause); Fr. *occasionalisme*, *hypothèse des causes occasionnelles*; Ital.

occasionalismo. The theory that matter and mind do not act upon each other directly, but that upon occasion of certain changes in one, God intervenes to bring about corresponding changes in the other. Each is then called the 'occasional cause' with reference to the other.

The theory was developed by Geulinx and Malebranche in order to deal with the problem—arising from the extreme dualism asserted by Descartes between thought and extension—of the interaction of mind and matter in general, and of the body and soul in particular, combined with the growing difficulties felt in forming any intelligible theory of causation. The same problem was dealt with in the single-substance theory of Spinoza and the Leibnitzian doctrine of pre-established harmony. Descartes in general had asserted that all changes of matter-in-motion are to be accounted for by reference to extension, while all psychical matters are to be referred to the nature of mind. This latter theory, however it might do for clear and adequate ideas, could not explain confused ideas and the passions and emotions connected with them. Here was an exception, and God had arranged in man a co-existence of the two substances, so that a disturbance of the 'animal spirits' (centring in the pineal gland) excited in the mind an unclear idea, whether sensation, passion, or emotion. This doctrine of *influxus physicus* was so obviously contradictory to the rest of the system, that the Cartesians at once set about doing away with it. With Geulinx the causal problem was the chief one; and he denies completely the possession of any efficient causality by matter. Its changes are, so to speak, only 'cues' upon which God effects the real results. Malebranche adds to this point of view the epistemological one: not only can one substance not directly influence the other, but they are so heterogeneous that mind cannot know matter. 'We see things in God,' matter again being the occasion rather than the real object of our knowledge.

Literature: DESCARTES, *Principia*, § 36; Meds., v and vi, *Passions de l'Âme*; GEULINX, *Ethics*, 113; Met., 26; MALEBRANCHE, *Recherche de la Vérité*, vi. 2, 3; FALCKENBERG, WINDELBAND, UEBERWEG, *Histories of Philosophy* (Index of each, sub verbo). (J.D.)

Occult [Lat. *occultus*, hidden]: Ger. *verborgen*; Fr. *occulte*; Ital. *occulto*. That which is hidden or secret. Cf. MAGIC.

It is applied to the assumption that insight into and control over nature is to be

obtained by mysterious and magical procedures, and by a long apprenticeship in secret lore. The physical sciences of the middle ages, alchemy and astrology, and in modern times spiritualism, theosophy, and palmistry, contain various factors of occult lore. Such doctrines, known as Occultism, fall outside the realm of modern science. See MAGIC. (J.J.)

Literature: A. E. WAITE, *The Occult Sciences* (1891); JASTROW, *Fact and Fable in Psychology*; OTTOLENGHI, *Suggestione e facoltà psichiche occulte* (1900). (J.J.—E.M.)

Ockham: see OCCAM.

Ockham's (or Occam's) Razor: see PARSIMONY.

Odour: see OLFACTORY SENSATION.

Oecology [Gr. *oikos*, a house, + *lógos*, science, discourse]: Ger. *Oekologie*; Fr. *oecologie*; Ital. *ecologia*. The science of economics as applying to plants and animals.

The term is principally used by Haeckel, oecology not being, at least yet, a clearly recognized branch of biology. (C.S.M.)

Offence (in law) [Fr. *offense*; Lat. *offensa*]: Ger. *Verbrechen*, *Vergehen*, *Übertretung*; Fr. *crime*, *délit*, *contravention* (Code Pénal, art. 1-5); Ital. *delitto*. (1) A transgression of law, which is punishable as a public wrong; a crime or misdemeanour.

(2) In English law, a petty crime, not the subject of an indictment, punishable by a pecuniary forfeiture.

A criminal prosecution for an offence does not exclude a civil action by the party injured for the damages he has sustained. In France the two remedies may be joined.

In early societies not directly affecting the state, wrongs to individuals seldom found a public prosecution. When private vengeance becomes unlawful, it is replaced by a civil action for damages, or for a fixed sum by way of legal compensation. See Holland, *Jurisprudence*, chap. xvi. 322. (S.E.B.)

Ohm: see UNITS OF MEASUREMENT (electrical).

Oken, Lorenz. (1779-1851.) Educated in natural science and medicine at Würzburg and Göttingen. Professor of medicine at Jena, 1807; of natural science, 1812; resigned for political reasons, 1819; professor in Munich, 1828; in Zürich, 1832; a pupil of Schelling.

Olfactometer: see LABORATORY AND APPARATUS, III, B, (e).

Olfactory Nerve: see NERVOUS SYSTEM, III.

Olfactory Sensations [Lat. *olfacere*, to

smell]: Ger. *Geruchsempfindungen*; Fr. *sensations olfactives*, *odorat*; Ital. *sensazioni olfattive*. The sensations aroused by adequate stimulation of the olfactory mucous membrane in the nostrils, called those of smell. The stimulus is called odour.

The number of qualities is unknown, although attempts have been made (latterly with some success) to distinguish groups or classes of smells. Smell intensities probably obey Weber's law. The human organ is very readily fatigued, but its degree of exhaustion varies with different odours. Certain smell sensations are complementary or antagonistic. Olfactory sensations are difficult of revival in idea, but this sense has a very high associative and distractive value. (E.B.T.)

Literature: modern literature begins with TOURTUAL, 1827. ZWAARDEMAKER, *Physiol. d. Geruchs* (1895); ARONSOHN, *Du Bois-Reymond's Arch.* (1886); v. VINTSCHGAU, *Hermann's Handb. d. Physiol.*, III. ii. 225; VALENTIN, *Lehrb. d. Physiol. d. Menschen*, II. ii. (1848) 277; FRÖHLICH, *Sitzber. d. Wien. Akad., math.-naturw. Cl.*, vi. (1851) 322; E.H. WEBER, *Arch. f. Anat. u. Physiol.* (1847), 342; J. MÜLLER, *Handb. d. Physiol. d. Menschen*, i. (1835) 759; SANFORD, *Course in Exper. Psychol.*, expts. 57-60; PASSY, *Année Psychol.*, ii. 362; art. *Olfaction*, in *Dict. Encyc. des Sci. Méd. de Déchambre*. (E.B.T.—L.M.)

Omnipotence [Lat. *omnis*, all, + *potens*, powerful]: Ger. *Allmacht*; Fr. *omnipotence*; Ital. *onnipotenza*. The attribute of God by virtue of which he is conceived to be able to realize all the possibilities presentable to his thought.

Omnipotence does not involve the ability to realize all possible conceptions, since there may be conceptions of the impossible or the self-contradictory. Nor does the omnipotence of God imply that all the conceivable possibilities are or will be realized. There may be alternative possibilities of which the choice of one will exclude the other. Nor does it imply that ethically God can contradict the moral attributes of his nature. The infinite holiness of God excludes the possibility of sin. That God should sin is not a contingency presentable to the divine thought.

Literature: see ATTRIBUTES (of God). (A.T.O.)

Omnipresence [Lat. *omnis*, all, + *praesens*, present]: Ger. *Allgegenwart*; Fr. *omniprésence*; Ital. *onnipresenza*. The attribute of God by virtue of which he is conceived to be present in the unitary wholeness of his being in every manifestation of reality.

God may be conceived as pantheistically present in every manifestation of reality; that is, as the substance of the manifestation itself. But he may also be conceived as present causally and effectually, or even in a negative and excluding sense. The nature of omnipresence is opposed to that of diffusion; God cannot be present in part. His presence in every part of the world must be whole and undivided.

Literature: see ATTRIBUTES (of God). (A.T.O.)

Omniscience [Lat. *omnis*, all, + *scire*, to know]: Ger. *Allwissenheit*; Fr. *omniscience*; Ital. *onniscienza*. The attribute of God by virtue of which his knowledge is conceived to be ideally complete and comprehensive of the whole nature of reality.

Assuming the existence of an intelligent deity, omniscience as an attribute of his nature cannot be denied. But supposing the question in debate to be that of the divine existence, then the most direct and cogent proof of the necessary existence of infinite and complete knowledge somewhere arises from the relativity and imperfection of human knowledge. St. Augustine develops this proof on the positive side, arguing from the existence of truth to the necessity of an infinite and absolute standard of truth; and recently Royce, in *The Conception of God*, develops the proof from the negative datum of the existence of error; also from the fragmentariness and incompleteness of human and finite knowledge. This necessitates the existence of an All-knower. Whether omniscience arises from the identity of God's thought with reality, or from its perfect correspondence with the real, is a debatable question in the metaphysics of religion. God's omniscience is a necessary presupposition of his foreknowledge and fore-determination.

Literature: see ATTRIBUTES (of God); ST. AUGUSTINE, *Contra Academicos*; ROYCE, *The Conception of God*. (A.T.O.)

One (the) [AS. *ān*, one; Gr. *τὸ ἓν*]: Ger. *das Eine, Eins und Viele* (one and many); Fr. *l'un (et le multiple)*; Ital. *l'uno (e il molteplice)*. A technical term of the Neo-Platonic philosophy denoting the absolute first principle—a principle above both Being and Thought, since these are both subject to definition and (in so far) to limitation. For the less ontological senses of the term see UNITY.

In the later oral teachings of Plato, he seems to have been much influenced by the doctrines of the Pythagoreans, and to have

attempted a synthesis of their theory of numbers with his own theory of ideas. In this doctrine he identified the One with the Good, with the supreme Idea and Being (see Trendelenburg, *Platonis de Ideis et Numeris Doctrina*), and attempted to derive from it the series of other ideas. This tendency was carried still further in the Old Academy. Speusippus distinguished the One from the Good, the One being the principle of which the Good is the result; and also from reason, which is reduced to the plane of the Platonic World-soul, as moving cause (Zeller, *Philos. d. Griechen*, II. i. 851-3). In other words, the formal or logical cause was placed above both the final and the efficient. Xenocrates made the One and the Dyad the supreme ground of all existence—the One being the first or male God, the Father and Nous; while the Dyad (indefinite plurality) is the mother; from their marriage arose numbers, and the Soul is Number which is self-moving. These fantastical distinctions found a fertile soil in Neo-Pythagoreanism and Neo-Platonism, and it is in the latter that the One becomes the supreme category. With Plotinus, the Absolute is entirely ineffable and incomprehensible; and can be described only as simple relation of Being to itself, excluding all distinction and all relativity, to express which the term the One, or the Only One, is chosen. From this the whole hierarchy of subordinate beings and distinctions radiate or emanate, without either efficient or purposive activity upon its part. Jamblicus desired to make the One still more transcendent and ineffable, and accordingly distinguished between the First One and the Second One, which is interposed between it and plurality, and is the source of further emanations. Proclus carries the doctrine to its end by declaring that the Absolute, since undefinable and unknowable, cannot be called even the One except figuratively. From it, however, proceeds a plurality of Ones, which are simple and supersensuous, and through which emanation proceeds towards Being and towards Thought.

Literature: ZELLER, *Philos. d. Griechen*, III. ii. 491, 521, 688, 793, 846; PLOTINUS, *Enneads*, VI. ix. 1. (J.D.)

One (the) and **The Many**: for foreign equivalents see ONE. See the ONE, and UNITY AND PLURALITY.

Oneirology [Gr. *ὄνειρος*, dream, + *λόγος*, science]: Ger. *Oneirologie*; Fr. (1) *onirologie*, (2) *oniromancie*; Ital. *onirologia*. (1) The

science of DREAMS (q. v.) and (2) of their interpretation

Cf. SLEEP (also for literature). Oneiro-mancy is a better term for (2). (J.M.B.—G.F.S.)

Ontogenesis [for der. see ONTOGENY]: Ger. *Ontogenese*; Fr. *ontogénèse*; Ital. *ontogenesi*. (1) The more restricted sphere of the ONTOGENY (q. v.) of particular organs or functions.

We speak of the ontogeny of a species, but of the ontogenesis of a specific or other character.

(2) Also used more widely for the problem of development as a whole as contrasted with the ontogeny of a particular species or group of the whole.

For the distinction between ontogenic and ontogenetic see GENETIC. (J.M.B., E.B.F.)

Ontogeny [Gr. *ὄν*, *ontos*, a being, + *γένν*, birth, development]: Ger. *ontogenetische Entwicklung*; Fr. *ontogénie* (more specialized than *ontogénèse*—Y.D.); Ital. *ontogenia*. A term employed in biology and psychology for individual development as contrasted with racial evolution or PHYLOGENY (q. v.).

Since the publication of Darwin's *Origin of Species* there has been much discussion as to the relations which the facts of ontogeny and phylogeny bear to each other. Haeckel, to whom the introduction of the terms is due, strongly supported the principle of RECAPITULATION (q. v.), that in ontogeny we have a more or less complete though abbreviated recapitulation of the phylogenetic evolution of the species. Although many observers have criticized this principle in detail, and shown that the completeness of recapitulation is never perfect, and often very imperfect, still there is, by general consent, much in ontogeny which serves to throw light on phylogeny. Cope and Hyatt have contended that by acceleration or retardation in ontogeny the order of recapitulation may have been profoundly modified and a new basis afforded for phylogenetic changes. Mehnert, following Agassiz, has urged that the rudiments (Anlagen) of stronger functional organs may appear in ontogeny earlier than those of weaker organs which preceded them in phylogeny. Weismann's conception of germinal selection suggests a means by which the order of development in ontogeny may be changed and certain stages in recapitulation omitted. A further distinction is that between DEVELOPMENT (q. v.) and growth, both included in the conception of ontogeny. Cf. EMBRYOLOGY, and ACCELERATION. (C.L.L.M.)

Hyatt has formulated the principle that the directions of decay in ontogeny—in old age,

&c.—anticipate structural degeneration in the phylogeny of the species in the same directions—a sort of reversed recapitulation (*Science*, Jan. 27, 1897), which with parallelism of the earlier stages in each series completes a parallel 'cycle' common to ontogeny and phylogeny (ibid., Jan. 29, 1897). (J.M.B.)

Literature: FRITZ MÜLLER, *Für Darwin* (1863); E. HAECKEL, *Gen. Morphol.*; E. D. COPE, *Origin of the Fittest*; ERNST MEHNERT, *Biomechanik erschlossen a. d. Principe d. Organogenese*; AUG. WEISMANN, *Germinal Selection*; MORSELLI, *Antropol. generale* (1887–1900); (in psychology) BALDWIN, *Ment. Devel. in the Child and the Race*. (C.L.L.M.)

Ontological Argument: Ger. *ontologisches Argument*; Fr. *argument ontologique*; Ital. *argomento ontologico*. The method of reasoning which infers the existence of God from a consideration of the content of the idea of God; ranked by Kant with the cosmological and physico-theological as one of the three fundamental conceptions of rational theology. See RELIGION (philosophy of).

Its best representative is Descartes, who, however, unites the psychological method of St. Augustine with the purely logical one of Anselm. See SCHOLASTICISM, I.

St. Augustine, starting with the fact of doubt, infers then to the reality of the inner subject. This self-assurance involves certainty of being, of life, of feeling, and of rational perception. The certainty of being demands that reason be ruled by a principle which is its norm, which accordingly it does not itself generate, but which is above it. The idea of perfect truth thus involves the reality of perfect truth. See PATRISTIC PHILOSOPHY (6).

Anselm, on the other hand, works upon the basis of mediaeval REALISM (q. v.). The universals are the reals; and since there are grades and degrees of universality, there are all grades of reality. The most universal, God, is the most real—*ens realissimum*. If one denies the existence of God, he must have the idea of God, and that means he has the idea of one than whom nothing greater can be thought. But to be in reality and in thought is greater than to be in intellect alone. Accordingly, if one have the thought of God at all, he must think of him as existing (Proslogium). This is often known as the 'Anselmian Argument.' Descartes argues from the existence of doubt to that of thought; and therefrom (by immediate inference) to that of the ego, and of mental pro-

cesses and ideas as bare facts at least. Such facts must have a cause; the cause must be at least equal to its effect. One has ideas of perfection, and by this principle one cannot be the cause, because one is not perfect. Only a perfect being could effect such an idea. And, again, the very idea of God, or of the infinite, involves that of necessary existence—his nature as such as to involve existence necessarily, not simply contingently, just as the idea of the triangle involves three-sidedness (*Meditations*, iii, and *Principia*, i. 14–6). In Spinoza the argument appears condensed into a definition of the Absolute—that which can be conceived only as existing. Kant attempts to show that both the cosmological and the teleological depend upon the ontological, so that if this can be shaken, all rational theology is also shaken. It is a contradiction to *think* of God as non-existent, but it does not follow that God exists. Existence is not a part of the content of thought, but rather something which controls and necessitates thought—something which is ‘given.’ Kant thus detects the essence of the whole rationalistic position in this argument—viz. the assumption that thought as such is a valid criterion of reality; while in truth, according to Kant, thought, *per se*, is only analytic of itself, and requires sense-experience to get a judgment of reality. Hegel, throwing overboard the ontological argument as an argument from *a* thought, the particular thought of God, holds that fundamentally Thought as such determines Being—or that at the root of all judgment is the presupposition of the identity of Thought and Being, or God; and that the old ontological argument may be regarded as a vague anticipation of this underlying unity.

Literature: see under THEISM, and RELIGION (philosophy of). (J.D.)

Ontologism [Gr. τὰ ὄντα, existing things, + λόγος, science]: Ger. *Ontologismus*; Fr. *ontologisme*; Ital. *ontologismo*. (1) The philosophical (ontological) method which proceeds from logical categories directly to reality: it is applied to the great speculative systems of which the ontological postulates are not grounded in experience.

Hume and Kant vigorously opposed ontologism. For the newer developments of the method cf. Ueberweg-Heinze, *Gesch. d. Philos.*, III. ii. (8th ed.) 328. (J.M.B.)

(2) The theory of the school founded by Gioberti in Italy (1801–52). The doctrine, namely, that the method and principles of

philosophy should be sought for in the object, not in the subject.

The theory is a reaction from the supposed subjectivism of modern thought. Gioberti held that Descartes had substituted a psychologic method (see PSYCHOLOGISM) for the true ontological, and that modern philosophy, in so far as it proceeded from an examination either of consciousness or of the process of knowing, had put philosophy further off the right track, and had logically ended in sensualism, Protestantism, and atheism. We must begin with the supreme and objective intuition of the mind: *Ens creat existentias*. While the theory originally was in the interests of Catholicism, Gioberti himself gradually modified his philosophical views in a somewhat pantheistic sense, and politically became one of the chief apostles of an independent and united Italy. Ontologism was condemned by papal authority in 1861, and again in 1862 and 1866. Aside from Gioberti's political views, this result was probably inevitable, as his original system, in presupposing an adequate intuition of absolute being, tended to subordinate theology to philosophy, and, indeed, to make revealed religion unnecessary. Gioberti and his system are of interest to Americans through their influence upon O. A. Brownson. The latter, however, endeavoured to avoid the theological errors of Gioberti, and held that while his philosophy was ontological, he was not an ‘ontologist’ in the sense reprobated by the Church.

Literature: UEBERWEG, *Hist. of Philos.* (trans. by Morris, and appendix by Botta), ii. 497–509; LOUIS FERRI, *L'Histoire de Philos. en Italie*, i. 387; BROWNSON, *Works*, ii. 126, 468 ff. (art. Ontologism and Psychologism). (J.D.)

Ontology [Gr. ὄν, ὄντος, being, + λόγος, science]: Ger. *Ontologie*; Fr. *ontologie*; Ital. *ontologia*. The doctrine or science of reality in its ultimate nature. Cf. METAPHYSICS, and PHILOSOPHY.

Plato uses the phrase ὄντως ὄντα to express the absolutely real character of the ideas; but being interested chiefly in the question of method in regard to them, uses Dialectic, not ontology, to denote the science which deals with them. Even Aristotle, who held that since every special science has its own peculiar sphere of existence (οὐσία, or ὄν) as its object, there must be a supreme science which deals with existence in its generality, being as being, ὄν ἢ ὄν, yet used the term ‘first philosophy’ or philosophy to designate this science. The

Scholastics, while regarding *Ens qua Ens* as the object of philosophy, yet subdivided and named it on a different basis. It was accordingly Wolff who made the term current. Philosophy is first divided into theoretical and practical; the former, called metaphysics, is again divided into a general part (ontology) dealing with being in general, irrespective of whether it is material or spiritual; and a special part dealing with the three chief forms of being, namely God, the world, and the soul (see Erdmann, ii. 223-4, and Zeller, *Gesch. d. deutsch. Philos.*, 183-8).

Wolff's identification of ontology with the logical principles of identity and contradiction had great influence (in a reactionary way) upon Kant. With Kant, ontology becomes a pretended science, since it attempts the impossible task of dealing with objects without any reference to the way in which they are given and known. Largely through his influence, ontology and ontological became terms of reproach, meaning vain attempts to deal with being apart from its presentation in consciousness (so G. H. Lewes and the English positivists generally). Sir William Hamilton defined it as the science which infers the properties of unknown being from its known manifestations—or as Inferential Psychology! (*Metaph.*, i. 124-5). The excess of emphasis upon the theory of knowing, as distinct from the theory of being, led, however, to scepticism and subjectivism, and so to a new conception of ontology as the science of the real, so far as that shall be determined through the process of knowledge; in other words, the question of the possibility of ontology is the question of the validity of knowledge.

Summing up, we may say that three stages are easily discernible. Ancient and even mediaeval philosophy are, as often said, predominatingly ontological; they are concerned with the objective, and it is assumed (naïvely or dogmatically) that being is as it is known to be, or that knowing is a process of participating in being, that it is itself a phase or factor in the structure of being. The second sense is the modern sceptical, or positivistic, in which it is assumed that being-in-itself (things as they really are) is to be sharply marked off from things in relation to us, or existence as presented through our senses, as phenomena. According to this view ontology is only the pretended and impossible theory of them. The third is the critical sense; the ancient dependence of knowing upon being

is reversed; the first need is to examine the nature, possibility, and validity of knowledge, and then, through the results thus reached, go on to consider the being known. Thus ontology is no longer the general theory of being, distinct from its special forms; it is the theory of the known reality as distinct from the theory of the process of knowing. English thought probably owes to Ferrier (*Inst. of Met.*, 47-9) the clear-cut recognition of this latter distinction of ontology and epistemology. (J.D.)

Ophelimity [Gr. *ὀφελιμος*]: Ger. *Ophelimität* (suggested—K.G.); Fr. *ophélimité*; Ital. *ofelimità*. The power of satisfying an individual want; as distinct from the more general term utility, which sometimes means the power of satisfying a real need which it is advantageous to society to meet.

The double use of the term utility has produced a certain amount of confusion (Cairnes); and Pareto has suggested this new term to represent utility as each person judges it. It is possible that this term may come into more general use.

Literature: PARETO, Cours. d'Écon. Polit. (1896). (A.T.H.)

Ophthalmia [Gr. *ὀφθαλμία*, a disease of the eyes]: Ger. *Ophthalmie*; Fr. *ophthalmie*; Ital. *oftalmia*. A term used to designate any form of inflammation of the conjunctiva. Many varieties are distinguished according to the character of the inflammation, its association with other diseases, &c. See Stephenson, *Epidemic Ophthalmia* (1897). (J.J.)

Ophthalmometry: see Eye, under VISION.

Ophthalmoscope: see LABORATORY AND APPARATUS, III, B, (1).

Opinion [Lat. *opinio*, used to translate Gr. *δόξα*]: Ger. *Meinung*, *Meinen* (MEANING, q.v.); Fr. *avis*, *opinion*; Ital. *opinione*. Private and individual BELIEF (q.v.), whatever its grounds, recognized as private and individual. Cf. KNOWLEDGE (2).

The distinction between knowledge (*ἐπιστήμη*) and opinion (*δόξα*) played an important rôle in Greek philosophy. According to Plato, *δόξα* mediates between knowledge and ignorance (cf. Eisler, *Wörterb. d. philos. Begriffe*, 'Meinung' and 'Erkenntniss,' for quotations from ancient and scholastic authors).

There is a tendency to make opinion a matter of tentative and somewhat superficial belief—recognized as such by the subject himself (cf. Wundt, *Logik*, i. 370). However this may be, as to the holder of the opinion, the fact that it is individual, and

also that it is not knowledge, gave it (the Stoics, Cicero) the suggestion of uncertainty and lack of objective ground, as in the expression 'mere opinion.' The term is now too loosely used for exactness. The distinction between belief and knowledge (cognition) now furnishes terms for the older antithesis. (J.M.B.)

Opinion (in philosophy). (1) Generally speaking, any idea or conception of fact, aiming at truth and regarded as probably approximating it, but confessedly not attaining certitude as regards it. It differs from HYPOTHESIS (q. v.) in not looking forward to future verification, nor aiming to serve any function of generalization or explanation. Its reference is rather to a condition of thought based upon evidence or inference not adequate to produce assured knowledge. It connotes belief, however, rather than doubt.

(2) Used in a more depreciatory sense to denote arbitrary or dogmatic preconception, e. g. a matter of mere opinion of unwarranted conviction.

The term now simply denotes a certain value or function of ideas taken in their objective reference; their worth as regards a standard of truth or certainty. As a technical term it is employed to translate the Greek *δόξα*. Parmenides distinguished τὰ πρὸς ἀλήθειαν from τὰ πρὸς δόξαν. The former designated whatever had to do with reason, and apprehended truth and being; the latter designated mere custom and blind belief, and related to appearance, non-being, error. This sense of the term is connected with the Greek *δοκεῖν*, meaning both to believe or think, and to seem. This sense of mere seeming or appearance is taken up by Plato. *Δόξα* refers to the region intermediate between being and non-being—the realm of phenomena—and is thus intermediate between mere sense (*αἴσθησις*) and rational thought (*διάνοια*). It is subdivided into a higher form (*πίστις*, conviction; sometimes called right opinion, *ὀρθή*, or *ἀληθής*, *δόξα*) and a lower (*εἰκασία*, conjecture, blind guessing). The former is based on reason (it is reasonable), though unaware of its basis—not reasoned. It mediates the connection with discursive, or demonstrative, thought, and relates to those aspects of the sensible world that embody mathematical and teleological relations, which, however, cannot be stated *per se* (*Theaetetus*, 187-203; *Timaeus*, 270 ff.; and *Republic*, Bk. VI. 510). Aristotle to a considerable extent subdivides Plato's metaphysical conception into a logical and a rhetorical one. The former makes opinion a mode of judg-

ment, hence arising in the soul as such, not from its affection by the body. As a mode of judgment, however, it does not rest upon an adequate syllogistic process, and hence does not reach demonstrative knowledge (*Anal. Post.*, Bk. I. chap. xxxiii; *Metaphysics*, vii. 15). The point of connection with Plato is in the fact that Plato related opinion to the world of change, not of being. Now, whatever changes may be otherwise than as it is, and hence it is not necessary, but contingent. On the rhetorical side, *δόξα* is a state of persuasion or belief, and the question of producing it is practical and psychological. Aristotle also makes much use of the conception of opinion in his ethics. All conduct relates to future, and therefore contingent, things—matters of opinion. But it is of the highest importance that these opinions should be formed in accordance with will, rather than with merely desire. *Φρόνησις* is the virtue of the habit of intellect in forming opinions in relation to right will. In general, *δοξαστικόν*, the sphere of opinion, is the probable. Plotinus makes opinion the region intermediate between imagination and reason; all knowledge of the physical world as such is opinion. It depends upon the senses, but is found only in a soul which reflects and reasons.

After the distinction between the subjective and objective was clearly established, the nature of opinion ceased to be a metaphysical problem. It simply denoted one case of the more general principle—the subjective. Consequently, in modern times, opinion hardly has a technical meaning. Hobbes uses it to denote the state of unstable and alternating ideas previous to judgment (*Leviathan*, Pt. I. chap. vii). Locke uses it in its present popular sense: the admission of something as true without assurance (*Essay*, iv. 15). Kant distinguishes matters of fact, of opinion, and of (rational) faith. The first refers to things, the existence of which can be proved either through pure reason or by exhibition in experience; the second refers to possible, but not actual, objects of experience in the world of sense, e. g. the existence of inhabitants upon Mars; the third to necessary objects of thought, but not of knowledge, i. e. God, immortality, the *summum bonum* (*Critique of Judgment*, Pt. II. § 91). (J.D.)

Opposition [Lat. *opponere*, to oppose]: Ger. *Opposition* (*Streit, Gegenwirkung*); Fr. *opposition*; Ital. *opposizione*. Used as a general term to cover all forms of antagonism and interference, and made by Tarde one of

three fundamental classes of phenomena recognized by science (*Les Lois Sociales*, 1898, Eng. trans., 1900; *Opposition Universelle*, 1896).

Cases of opposition are (see these terms) SUGGESTION (contrary), ANTITHESIS, CONTRAST, INHIBITION, CONTRADICTION, INTERFERENCE (in physics), ANTAGONISM (muscular), and, in technical senses, OPPOSITION (in logic), SOCIAL OPPOSITION, and CONSTRAINT (in social science). (J.M.B.)

Opposition (in logic). One of Aristotle's POSTPREDICAMENTS (q. v.). There are said, in the book of *Categories* (cap. x), to be four kinds of opposites. Relative opposites are relate and correlate of a disjunctant relation. Contrary opposites are the most unlike species of the same genus, as black and white, sickness and health. The third kind of opposition is between a habit and its privation, as sight and blindness. The fourth kind is between affirmation and negation. This passage has prevented the word opposite from taking any definite meaning in philosophy. (C.S.P.)

The following scheme is currently used to illustrate the forms of opposition as between the assertions of each two of the four propositions A, E, I, O (see those topics).

Optical Axis: Ger. *Augenaxe*; Fr. *axe de l'œil*; Ital. *asse oculare*. A straight line drawn through the centre of curvature of cornea and lens, and prolonged to the posterior wall of the eye. It is the sagittal axis mentioned under CENTRE OF ROTATION (q. v.).

Literature: HELMHOLTZ, *Physiol. Optik* (2nd ed.), 5, 88, 108; WALLER, *Human Physiol.*, 412. (E.B.T.)

Optical Illusions: Ger. *optische Täuschungen*; Fr. *illusions visuelles, illusions d'optique*; Ital. *illusioni visive* (or *ottiche*). (1) Broadly, any visual perception or judgment which cannot be harmonized with the deliverances of the other senses or of vision under ordinary conditions. In this sense the term includes all physical illusions (effects of mirrors, lenses, prisms, &c.), the physiological illusions attending the perception of colour (after-images, contrast, colour-induction, &c.), and the physiological and psychical illusions

attending the perception of space, movement, motion, and the character of objects. (2) In a more restricted and usual sense, it includes only the last group, and of these only those occurring with sound and sane observers.

I. *Assimilative illusions.* Illusions due to the assimilation of the sensory data with an improper group of ideas, i.e. illusions resting on a false interpretation of visual data, as the mistaking of a dimly seen stump for a highwayman by a timid traveller. Illusions affecting the meaning and character of objects belong to this class.

II. *Equivocal figures.* Mostly figures capable of two or more spatial interpretations. The double interpretation is most easy when the figures are observed monocularly. Fig. 1 (the figures are numbered consecutively on the accompanying Plates I-IV¹) may be seen in the form of a partly open book with the back or the face towards the observer; Fig. 2 as a tetrahedron, erect or leaning backward. The first three of the group of forms marked Fig. 3 show similar possibilities with still simpler lines; all can be seen as right angles in perspective, and with two spatial arrangements of one or both lines. The fourth form is a reduplication of one of the simpler ones, intended to show their relation to Zöllner's Figure (Fig. 26). Two of the equivocal figures are known by special names: Fig. 5 is *Schröder's Stair*, and Fig. 6 *Necker's Cube*. Fig. 4 allows double interpretation of a non-spatial kind; the pattern may be regarded as black on a white ground, or vice versa. Inversions of relief may also be observed in actual objects when the ordinary criteria of relief are weakened or absent. Some investigators have classed these figures with the assimilative group; others have explained their behaviour by eye-movements and other perceptive factors.

III. *Geometrical-optical illusions.* These are false perceptions, or judgments, of the geometrical relations in plane figures, except such as involve irradiation, which are usually classed by themselves. Figures exhibiting the geometrical-optical illusions are numerous, as are also the theories for their explanation. In the absence of agreement among the latter no satisfactory classification is possible. The following may serve roughly, however, for

¹ Many of these, like geometrical figures generally, are common property. The original designers have never hindered their free reproduction. In exact form many of the figures given in the plates follow Sanford, and are reproduced with the consent of Messrs. Heath & Co., Boston.

purposes of description: (1) illusions of interrupted extent; (2) illusions depending on position in the visual field; (3) illusions of contrast; (4) illusions of contours; (5) perspective illusions; (6) special and miscellaneous figures.

1. *Illusions of interrupted extent.* In Fig. 7 the dotted space at the left is equal to the open space at the right, but seems larger; in Fig. 8, however, the single interruption reverses the illusion. Figs. 10, 11, and 12 are equal squares, but 10 seems too high and 11 and 12 too broad. Fig. 12 seems a little broader than 11, possibly because the central cross-line induces the eye to traverse the figure at that point, giving the interrupting lines their maximum effect.

2. *Illusions depending on position in the field of vision.* Vertical distances or extents in the upper part of the field are apt to seem too great. Fig. 14 is a perfect square, but seems a little too high; the lower parts of S's and 8's seem disproportionately large when inverted: S S S, 8 8 8. The illusion does not, however, appreciably affect the circle in Fig. 13. Figures lying in the periphery of the field appear distorted. Fig. 9, when drawn on a large scale and viewed with motionless eye at a distance proportional to the line below the figure, appears as a checker-board of equal or nearly equal squares.

3. *Illusions of contrast* (Figs. 15 to 18). In Fig. 15 the central circles are equal, in Fig. 16 the central angles, in Fig. 17 the two parts of the line between the squares, in Fig. 18 the middle part of the lines, but in each case the circle, angle, or line seems smaller when adjacent to large extents and larger when adjacent to small.

4. *Illusions of contour.* In Fig. 19 the unclosed semicircle seems a little flatter and of a little greater radius than the closed; in Fig. 20 the parts of the interrupted circumference seem a little flattened as though belonging to one of slightly greater radius. In Fig. 21 the middle space and the open-sided squares on either side are equal and square, but the middle space seems a little too high and narrow and the open-sided squares a little too low and broad. These figures are examples of Müller-Lyer's 'illusions of confluxion.'

5. *Perspective illusions.* In Fig. 22 the perspective suggestion of the cube makes right angles seem oblique and oblique right. In Fig. 23 the converging lines, in proportion as they suggest perspective, influence the apparent height of the parallelograms. Variants

of this figure in which human forms replace the parallelograms show the illusion more effectively. In Fig. 24 the addition of the oblique lines at the end of the lower pair of parallels makes them seem further apart than the sides of the little rectangle above. When these are not added the short parallels seem further apart than the long.

6. *Special and miscellaneous figures.* Under this head are grouped a number of figures which are usually known by special names, together with a number of other figures of more or less interest. Fig. 26 is *Zöllner's Figure*—the presence of the short oblique lines distorts the actual parallelism of the long lines. Fig. 27 is *Poggendorff's Figure*—the continuation of the left oblique line is really the lower of the obliques on the right, not the upper, as appears to be the case. Fig. 28 is *Müller-Lyer's Figure*, or the 'optical paradox'—the central horizontals in the two figures are equal, but do not seem so. Of these three figures there are many variants. For example, Figs. 29 and 30, in which actual parallels are made to appear curved in opposite directions, may be regarded as variants of the Zöllner Figure; Fig. 32, in which the distance between the adjacent sides of the first and second circles is equal to the distance between the remote sides of the second and third, is a variant of the Müller-Lyer Figure; and Fig. 34, in which the right oblique if prolonged would cut the left oblique and the vertical in the same point, is a variant of the Poggendorff Figure, as is also the 'illusion of the Gothic arch,' frequently to be observed when a column is seen against a portion of an arch.

Besides these three figures there are a number of others that are sometimes referred to under the names of their originators, though the usage is not so well established. The illusion underlying Fig. 9 is known as *Recklinghausen's Illusion*; Fig. 15 is the *Figure of Ebbinghaus*; Fig. 17 is *Baldwin's Figure*; Fig. 23 is *von Bezold's Figure*; Fig. 25 is based on *Loeb's Illusion*; Fig. 29 is *Hering's Figure* (two or three other figures, variants of the Zöllner Figure, and Fig. 7 are sometimes also called by Hering's name); Fig. 30 is *Wundt's Figure*; Fig. 31 is *Münsterberg's Figure* (called also the Milton-Bradley Figure or the 'Shifted Checker-board Figure'); Fig. 33 is *Mellinghoff's Figure*; Fig. 34 is *Delbœuf's Figure*; Figs. 40 and 41 have both been called *Láska's Figure*. *Pisco's Figure*, not shown in the plate, is a variant of the Zöllner Figure.

Figs. 25, 31, 33, and 35-41 are miscel-

laneous figures that have played more or less of a rôle in the discussion of theories. In Fig. 25 the right one of the short parallels is a continuation of the single line above, but seems to be a little too far to the right; the long line at the left is supposed to lie in the median plane of the observer. Similarly, in Fig. 33 the three dots lie exactly in line with the short lines on either side of them, but seem a little too high. In Fig. 31 the central line is straight and parallel with the side lines. This figure has been regarded as a variant of the Zöllner Figure, but is really of a wholly different class, namely, of the irradiation figures. Fig. 35, showing the circle flattened at the corners of the square, was formerly regarded as an example of the 'over-estimation of small angles.' The two figures of Fig. 36 show the same effect, the horizontal line in the upper figure being bent downward very slightly at the ends, and in the lower figure bent upward. The principle of 'the over-estimation of small angles' has been found of limited application, and has been discarded as a principle of explanation. In Fig. 37 both trapezoids are of the same size, but the lower looks a little larger. In Fig. 38 the inner circle in the left figure and the outer in the right are exactly the same size; in Fig. 39 the two ring segments are equal, in Fig. 40 the two arms of the angle, but in no case does it seem so. In Fig. 41 the arms of the angle are equal, but that having the nearer dot usually seems a little longer.

Theories. The most systematic explanations are those of Lipps and Wundt. (1) Lipps sets up a principle of mechanical-aesthetic unity, in virtue of which every space form is endowed by us, in idea, with a living personality, or regarded as the scene of the interplay of mechanical forces. Our judgments of comparison are modified, unconsciously, by this anthropomorphic attitude. The circle, for example, is the result of the action of tangential and radial forces, in which the radial seems to triumph; the figure has therefore a centripetal character, which leads to underestimation: Fig. 13 looks smaller than 14, though the height and breadth of both is the same. (2) Wundt makes the illusion a matter not of deception of judgment, but of direct perception. It is conditioned by the laws of retinal image (fixation) and eye movement. Vertical distances, for example, seem greater than horizontal, because the expenditure of energy is greater in raising the eyes than in turning them through an

equal angle to one side. These theories are typical of two great classes of theories: Lipps' theory of the judgment or higher process class, and Wundt's of the perceptive class. All the other proposed explanations may indeed be regarded as variants, or less perfect formulations of one or other of these. So we have the perspective theory of Hering, Guye, Thiéry; the contrast theory of Helmholtz, Heymans, Loeb; the contrast-confluxion theory of Müller-Lyer; the indistinct vision theory of Einthoven, &c.

The observation of the geometrical-optical illusions appears to begin with Oppel in 1854-5 (*Jahrb. d. Frankfurter Ver.*).

IV. *Illusions affecting the perception of distance.* Besides the geometrical-optical illusions there is an important group affecting the perception of the third dimension. Alteration of any of the ordinary criteria of distance or relief may open the way for illusions of this kind. They include the 'looming' of objects in a fog, the flattening of the dome of the sky, and the enlargement of the moon at the horizon, the alteration of relief with alteration of cross shadows, changes in inverted pictures or in the landscape when regarded with an inverted head, and many others. Here belong the illusions of the STEREOSCOPE, PSEUDOSCOPE, and TELESTEREOSCOPE (q. v.). See also ILLUSIONS OF MOTION AND MOVEMENT (visual).

Literature: optical illusions are treated in most of the standard physiologies, in many works on physics, and in the more recent textbooks of psychology. The following list has been confined for the most part to books and articles dealing exclusively with the matter in hand. For more extended references the general bibliography accompanying the 2nd ed. of HELMHOLTZ's *Physiol. Optik*, and the annual lists of the *Psychological Index*, may be consulted. General: HOPPE, *Psychologisch-physiologische Optik* (Leipzig, 1881); SULLY, *Illusions* (N. Y., 1882); HELMHOLTZ, *Physiol. Optik*, 2. Aufl. (1896), especially §§ 28 and 30.

Arch. f. Physiol. (1899), x. 53-73, and STEWART, Amer. J. of Psychol. (1900), xi. 240-3. See also under ILLUSIONS OF MOTION AND MOVEMENT. (E.C.S.-H.C.W.)

Optic Nerve: see NERVOUS SYSTEM, III.

Optics [Gr. τὰ ὀπτικά, things pertaining to vision]: Ger. *Optik*; Fr. *optique*; Ital. *ottica*. (1) Psychological: the science of sight or vision.

This science includes (1) the anatomical description, gross and fine, of the total visual apparatus; (2) the dioptries of the eye; (3) an account of the physiological functioning of the visual apparatus; (4) the doctrine of visual sensation, and (5) that of visual perception. See the various subordinate titles, and also VISION. (E.B.T.)

(2) Physical: the science of light.

It includes the phenomena of reflection, refraction, diffraction, interference, absorption, &c., of light. See Light under VISION. (C.F.H.)

(3) Pathological: the science of abnormal and defective VISION (q.v., defects of). (J.M.B.)

Literature: general works on psychological optics are: HELMHOLTZ, Physiol. Optik (1st ed., 1867; 2nd ed., 1885-96); AUBERT, Grundz. d. physiol. Optik (1876); FICK, KÜHNE, and HERING, in Hermann's Handb. d. Physiol., ii. 1 (1879); VON KRIES, Die Gesichtsempfindungen und ihre Analyse, Du Bois-Reymond's Arch. (1882); and later papers in the Zeitsch. f. Psychol., &c.; G. E. MÜLLER, Zur Psychophysik d. Gesichtsempfindungen (1897); HERING, Zur Lehre vom

Lichtsinn (1878), and later papers in Arch. f. Ophthal., &c. A full bibliography, up to 1894, is given by KÖNIG in HELMHOLTZ, Physiol. Optik (2nd ed.), 1017 ff., and after 1893 in the annual Psychological Index; see the literature of VISION, and cf. also BIBLIOG. G, 2, u. (E.B.T.)

Optimism and Pessimism [Lat. *optimus*, best, superlative of *bonus*, good, and *pessimus*, worst, superlative of *malus*, bad]: Ger. *Optimismus* and *Pessimismus*; Fr. *optimisme* and *pessimisme*; Ital. *ottimismo* and *pessimismo*. These are opposite correlative terms applied to the valuation of experience, life, and the world. Optimism is the view that the world is thoroughly good; or, that it is the best possible world. Pessimism is the view that the world is thoroughly bad; or, that it is the worst possible world. The problem is that of the relation of the world as a physical, or metaphysical, existence to its interpretation in ethical terms.

Plato, in the *Timaeus*, was the first to formulate the conception of optimism. His problem is the relation of the world as created to the demiurge, its architect. He made it, although sensible and changeable, after the pattern of the eternal and ideal; 'he desired that all things should be good, and nothing bad, so far as this was attainable,' and so the world, being like the fairest and most perfect of intelligible beings, is a 'blessed god' (34), and a 'sensible god, the greatest and best, the fairest, the most perfect possible, the image of its maker' (92). None the less, as created, as sensible, the world implies non-being, and hence evil. There is a limit set; the world is to be good, 'so far as that is attainable.' And in other of his writings he dwells in a somewhat gloomy spirit upon the evils thrust into the life of man by his connection with the sensible world and the material body, so that the good is reached by withdrawal from the created world (so in *Phaedo*, *Phaedrus*, parts of *Gorgias*, and the tenth book of the *Republic*). In this conception of the element of non-being in the world of experience, limiting the eternal good, Plato is the logical father of pessimism as well as of optimism. In him the Greek spirit was so strong that upon the whole the sensuous is looked upon as the plastic embodiment of the ideal, and hence as fair and good. But the elements are in unstable equilibrium, and it needs only to have the emphasis fall upon the negative limit to have a pessimistic result. The Stoics and Neo-Platonists continued the

optimistic tradition of Plato, and so did the great Scholastics, following, however, in mode of statement, the Aristotelian teleology, rather than the Platonic tradition. The Epicurean and Sceptical schools were empirical rather than philosophical pessimists: they dwelt upon the actual bulk of pain and evil in the world, as confutation of the Stoic ethics.

* Leibnitz repeats, in amplified form, a teleological optimism in his *Théodicée*. The world must be the best of all possible worlds, for it is the work of God. God through his wisdom knew all possibilities, and through his goodness chose the best of these possibilities, and through his power created it. Evil is of three forms: metaphysical, the expression of the necessary finitude of the world; physical, which serves to teach us law by punishing its infractions; and moral, which is a necessary phase of freedom. This optimism made its way through Wolff and others into the popular philosophy of the rationalistic enlightenment, and is seen, for example, in Pope. Like the optimism of the Stoics, it was met on empirical rather than philosophic grounds; notably by Voltaire's *Candide*, which, in its ironical treatment of Leibnitz, comes perilously near the doctrine that life is not worth living. In his *Phil. ignor.* Voltaire catalogues all the sources of woe in the world. Kant, in his early period, repeats the optimism of Leibnitz (*Versuch einiger Betrachtungen über den Optimismus*, 1759). In his critical period Kant holds that there is a radical evil in man's nature in his tendency to make self-love—the particularistic, sensuous principle—the motive of his actions. The good principle is that of humanity, which is rational and universal.

Rousseau had already raised the question of good and evil in the historic and social life of man, in his assertion that the primitive, natural man was thoroughly good, and was rendered thoroughly evil by institutions and culture. Kant took up this problem, in connection with his notion of the twofold structure of man just referred to; he held that in the state of nature the natural propensities are good, since adapted to their end. Physically there is 'Paradise,' morally a state of complete innocence. But man becomes conscious of himself, has a will, departs from the natural law implanted in his instincts, and evil arises—the 'Fall.' Conscious desires lead to work, to the arts, to property, to civil relations, to culture. Through culture man's

life ceases to be something produced by nature, and is self-produced. The conflict of nature and culture produces unhappiness, but is an ethical necessity incident to the recognition of rational law. The end of history is not the happiness of the individual, but the perfection of the whole of humanity. Conflict and suffering lead towards the latter. In short, Kant is a pessimist regarding man in his natural actuality, an optimist regarding him in his moral possibility.

Hegel seizes upon the three factors implied in the history now resumed: (1) the relation of the negative factor in creation to the Creator (where he utilizes Fichte's idea), (2) the relation of the particular and universal in man, and (3) the function of conflict and suffering in history; and attempts to make a synthesis of pessimism and optimism. Since the absolute is not a static fact or content, but a process, it involves negation, particularization, and consequent conflict and suffering within itself. But this conflict through differentiation is the dynamic of progress, and so functions for good. In a static cross-section the world is evil; in its movement (which Hegel calls 'actuality') it is good.

The French Revolution introduced the positive side of the negative teaching of Rousseau. It held that a reform of economic and political conditions was all that was necessary to initiate a tendency towards the infinite perfectibility of man. Malthus's doctrine of population was purposely intended to refute this conception. As generalized and applied by Darwin, it has carried over the question of optimism and pessimism into the biological sphere. One school points to the universality of the struggle of existence as teaching the lesson of pessimism; another, the contribution made by this struggle to development as indicating an optimistic conclusion. Spencer has used the evolutionary conception to argue to the self-destructive, and hence transitional, character of evil.

Schopenhauer is the pessimistic pendant of Hegel's optimism. Will, not thought, or reason, is the absolute—the true thing-in-itself. This will is irrational, hence objectless; there is no progress or development, but only the restless play of purposeless will. Hence the will is essentially unhappy. Since the objective world is only a picture of this will, it must be a world of suffering. This metaphysical reasoning is reinforced by psychological considerations; desire is essen-

tially painful, and its satisfaction, pleasure, is only the removal of pain. Hence pain must preponderate in life. All experience and observation confirm this result. Von Hartmann attempts what he regards as a synthesis of Hegel and Schopenhauer. There is a logical factor and an alogical one, both attributes of the unconscious. While the will-factor makes it better that the world should not exist than exist, yet the world is the best of all possible worlds, and continually evolving to higher intensities of consciousness. Its teleology is optimistic, although from the standpoint of satisfaction the world is evil.

Current popular thought phrases the problem in the question of whether life is worth living. Interest has shifted from the theological problem to the question of intrinsic value of life. Cf. MELIORISM. (J.D.)

Optotype: see TEST-TYPE.

Opzoomer, Cornelius Willem. (1821-92.) Educated in Leyden. He became professor of philosophy at Utrecht. He was an empiricist of the positive type.

Oracle [Lat. *oraculum*, from *orare*, to speak]: Ger. *Orakel*; Fr. *oracle*; Ital. *oracolo*.

(1) The response of a heathen deity to a solemn petition for information or guidance in some matter of importance, ordinarily communicated through a human medium.

(2) In the Hebrew and Christian Scriptures it is used in the plural, and applied (1) to the special communications of God to or through his prophets, (2) to the whole body of inspired writings. (A.T.O.)

Order (in biology) [Lat. *ordo*, order]: Ger. *Ordnung*; Fr. *ordre*; Ital. *ordine*. In biological classification, a group of greater value than a family.

An order usually, but not necessarily, comprises several families. The use of the term is entirely conventional. See CLASSIFICATION. (C.S.M.)

Order (moral): Ger. (1), (2) *sittliche Ordnung*, (3) *Weltordnung*; Fr. *ordre moral*; Ital. *ordine morale*. (1) The system of facts and relationships to which ethical predicates are applicable; called also variously the 'world of values,' the 'universe of worths,' the 'sphere of appreciation of ideals'; in

contrast with 'world of facts,' 'universe of science,' 'sphere of description of the real.' See WORTH.

(2) The establishment and maintenance of order in ethical relationships, as opposed to moral disorder; generally in reference to social rights and duties; also with reference to the divine GOVERNMENT (q.v.) of the world. Cf. THEODICY. (J.M.B.)

(3) The order of the universe conceived as making for moral ends.

The relation of the moral to the natural order of the universe is a question which belongs rather to the metaphysics of ethics, or moral philosophy, than to ethics proper, or moral science. The Stoics, following Heraclitus, identified the moral with the universal order, finding in both the expression of the common reason. The early British rationalists may be said to take fundamentally the same view, giving it, however, a theistic and less ethical construction. Kant held that the moral order is the order of the noumenal or intelligible world, which transcends the empirical or phenomenal order, and implies a moral orderer, who shall ultimately equate virtue and happiness. For Hegel the moral order is part of the cosmical order, and finds its perfect expression only in the world-state. The evolutionists either resolve the ethical into the cosmical order or make the ethical a more adequate or higher statement of the same world process which produces and includes the cosmic. Huxley, in his Romanes Lecture on *Evolution and Ethics*, insists upon the antithesis of the ethical to the cosmic process, yet accounts for the former as arising from the latter.

Literature: (3) GREEN, *Prolegomena to Ethics*, Bk. I; ALEXANDER, *Moral Order and Progress*; FRASER, *Philos. of Theism*; A. SETH, *Man's Place in the Cosmos*; HUXLEY, as cited; discussion by ROYCE, BALDWIN, WHITE, in *Int. J. of Ethics* (1895); general works on ethics. (J.S.—J.M.B.)

Ordinance [Lat. *ordinare*, to order or arrange]: Ger. *Verordnung*, *Vorschrift*; Fr. *ordonnance*; Ital. *ordinanza*. In religion, a religious rite or ceremony instituted by divine authority or by the enactment of some ecclesiastical body. (A.T.O.)

Ordinate: see CURVE.

Organ [Gr. *ὄργανον*]: Ger. *Organ*; Fr. *organe*; Ital. *organo*. A differentiated part of an ORGANISM (q.v.) partially independent anatomically and physiologically, and perform-

ing some special active function or group of functions. (C.S.M.)

Organic [Gr. *ὀργανικός*, pertaining to organs]: Ger. *organisch*; Fr. *organique*; Ital. *organico*. (1) Relating to that which has life, whether animal or vegetable; opposed to inanimate or inorganic. See ORGANISM (vital). But since the peculiarity of living beings is a certain relation of the parts to one another, such that they mutually act and react upon one another so as to maintain the whole in existence, it means (2) that which possesses a similar necessary relationship of whole and part; that which is systematized; that which is an internal or intrinsic means to an end, as distinct from an external or accidental one. This sense shades into teleological and is opposed to MECHANICAL (q. v.).

Historically, the identification of organic with the living comes last. Aristotle uses the term as equivalent to instrumental; even as synonymous with mechanical, i. e. the means that brings about a result. An organic body is one, whether living or not, in which heterogeneous elements make up a composite whole. This sense persists till Leibnitz, who uses the term in a sense easily confused with the modern significance of living, but yet not the same. According to him, that is organic all of whose parts are in turn machines, i. e. implements adapted to ends. 'Thus the organic body of a living being is a kind of divine machine or natural automaton, because a machine which is made by man's art is not a machine in all its parts; for example, the tooth of a brass wheel has parts or fragments . . . which have nothing in themselves to show the use to which the wheel was destined. . . . But nature's machines are machines even in their smallest parts *ad infinitum*' (*Monadology*, § 64; see also the *Princ. de la Nature*, 31).

From this time on, the two elements in the conception (that of composition of parts and of relation of means to end) are intimately connected, and Kant welds them together in his famous definition of the organic as that in which all the parts are reciprocally means and ends to one another and to the whole (*Werke*, iv. 493). It is this conception of the whole as primary which marks off the conception from the Leibnitzian, in which the distinction goes on *ad infinitum*. This tends to change the indefinite pluralism of Leibnitz into a systematic monism when the conception 'organic' is applied to the world

at large. Cf. LIFE, ORGANISM, and SOCIAL ORGANISM.

Literature: EUCKEN, *Philos. Terminol.*, 26, 138, 153, 202; MACKENZIE, *Introd. to Social Philos.* (J.D.)

Organic (in psychology). Characterizing psychological states or functions which are wholly or largely conditioned by physiological processes.

The distinction is usually between 'organic,' 'lower,' 'coarser,' &c., and 'reflective,' 'voluntary,' 'higher,' 'finer,' &c., as in the phrases organic SYMPATHY (q. v.), organic ('instinctive' or 'spontaneous') emotion (cf. BASHFULNESS, JEALOUSY, FEAR), to which are opposed the 'reflective' or, in earlier literature, 'rational' forms of the emotions, &c. 'Sensuous' and 'ideal' are terms sometimes used to cover the same distinction—which, however named, is open to much ambiguity. In most of the discussions—notably of emotion—in which the distinction is made, organic means unreflective, or, as not involving reflection, spontaneous, which last is the most appropriate word. Cf. also REFLECTIVE AND UNREFLECTIVE.

Literature: many of the discussions of REFLECTION (q. v.), *passim*; many of the works on EMOTION (q. v.). Special discussions with reference to 'organic' emotion are: SCHNEIDER, *Mensch. Wille*; BALDWIN, *Ment. Devel.* (chaps. on 'Emotion' and 'Sentiment' in both vols.). (J.M.B., G.F.S.)

Organic Imitation: see IMITATION, MIMETISM, and CIRCULAR REACTION.

Organic Memory: Ger. *organisches Gedächtniss*; Fr. *mémoire organique*; Ital. *memoria organica*. A term suggested by Hering for the functional reappearance of conditions once impressed upon the nervous system, after analogy with conscious memory. (J.M.B.)

Literature: HERING, *Memory as a Function of Organized Matter* (Eng. trans.); BUCOLA, *Mem. organica*, *Riv. di Filos. Scient.* (1881); MORSELLI, *Semej. malat. ment.*, ii. (1895). (J.M.B.—E.M.)

Organic (or Indirect) Selection: Ger. *organische or indirekte Selektion*; Fr. *sélection organique or indirecte*; Ital. *selezione organica or indiretta*. The theory that individual modifications or accommodations may supplement, protect, or screen organic characters and keep them alive until useful congenital variations arise and survive by natural selection. Cf. COINCIDENT VARIATION, and MODIFICATION. The theory of evolution which

makes general use of organic selection is called ORTHOPLASY (q.v.).

The theory, it is evident, involves two factors: (1) the survival of characters which are in any way assisted by acquired modifications, &c., during periods in which, without such assistance, they would be eliminated—until (2) the appearance and selection of congenital variations which can get along without such assistance. The second factor is simply direct natural selection; and it is the first which is the characteristic feature of this theory. By the co-operation of the acquired characters a species or race is held up against competition and destruction while variations are being accumulated which finally render the character or function complete enough to stand alone. Illustrations of this 'concurrence'—as it may be called—between acquired and congenital characters will be found in the literature cited below. The definitions which follow show differences of emphasis.

In the words of Osborn: 'Individual or acquired modifications in new circumstances are an important feature of the adult structure of every animal. Some congenital variations may coincide with such modifications, others may not. The gradual selection of those which coincide (coincident variations) may constitute an apparent inheritance of acquired modifications;' and of Lloyd Morgan (*Habit and Instinct*, 315): 'Though there is no transmission of modifications due to individual plasticity, yet these modifications afford the conditions under which variations of like nature are afforded an opportunity of occurring and of making themselves felt in race progress.' It is described by Headley as 'natural selection using Lamarckian methods' (as cited below, 120). Groos, in expounding organic selection, speaks of the effects of imitation as 'keeping a species afloat until natural selection can substitute the life-boat heredity for the life-preserver tradition' (work cited below, 283).

The relation of organic to natural selection is also involved in the question of the nature and origin of the PLASTICITY (q.v.) which organic selection requires. The different views are (1) that this plasticity is itself entirely due to natural selection (Poulton); (2) that it is an original property of organic matter (Osborn); (3) that there are two forms of plasticity, as indicated under that topic (Morgan, Baldwin), that of which organic selection makes use, however, being largely the product of natural selection.

This general way of looking at certain cases of survival in the struggle for existence was independently arrived at by L. I. Morgan, H. F. Osborn, and J. Mark Baldwin, and the term 'organic selection' was proposed by the last named on two grounds: (1) because the organism, by effecting accommodations, screens its characters, and so gives them a chance of being kept alive; and (2) because the organism thus, so to speak, selects itself; that is, it is its own accommodations which are instrumental in securing its survival. It is the *behaviour of the organism*, therefore, which is important, and not variations alone, as in simple natural selection generally—and hence the adjective 'organic.' It is in so far the *organic* functions—reactions, struggles, efforts, conscious choices, &c.—which really count and determine what sort of characters shall be saved by natural selection.

The term 'indirect selection,' which some prefer (Poulton, Morgan), has reference to the way in which natural selection comes into operation in these cases, i. e. indirectly through the saving presence of modifications, and not directly upon useful variations. This term was suggested by an anonymous writer in the *Zoological Record*. Poulton also used the term indirect in its adjective form in the following (see reference below): 'These authorities justly claim that the power of the individual to play a certain part in the struggle for life may constantly give a definite trend and direction to evolution; and although the results of purely individual response to external forces are not hereditary, yet indirectly they may result in the permanent addition of corresponding powers to the species. The principles involved seem to constitute a substantial gain in the attempt to understand the motive forces by which the great process of organic evolution has been brought about.'

The effectiveness of the method of screening and so accumulating certain variations in producing well-marked types is seen in ARTIFICIAL SELECTION (q.v.), where certain creatures are set apart for breeding. But any influence, such as the individual's own accommodation to his environment, which is important enough to keep him and his like alive, while others go under in the struggle for existence, may be considered with reason a real cause in producing just such effects. Thus by the processes of accommodation, a weapon analogous to artificial selection is put into the hands of the organism itself, and the species profits by it. Headley characterizes

this aspect of the case as follows: 'The creatures pilot themselves. . . . Selection ceases to be purely natural: it is in part artificial' (as cited below, 128; see also Baldwin, *Amer. Natural.*, as cited below). Cf. the view of J. Ward called SUBJECTIVE SELECTION (q. v.).

This point of view has had especial application and development in connection with DETERMINATE EVOLUTION (q. v.), which, when organic selection is operative through a series of generations, becomes what is called ORTHOPLASY (q. v.); with the rise of INSTINCT (q. v.); with the origin of structures lacking in apparent utility when full-formed or when only partly formed (cf. EVOLUTION); with correlated variations, co-ordinated muscular groups, &c. (see CORRELATION, in biology, and INTRA-SELECTION); with MENTAL EVOLUTION (q. v.), and SOCIAL EVOLUTION (q. v.).

That this form of selection is a real factor in evolution, either as taken with natural selection or as a form of original 'self-development,' replacing natural selection (Osborn, citation below), is now widely admitted: among biologists, by Osborn, Wallace, Poulton, Thomson, Whitman, DeFrance, Davenport, Conn, Headley, and others; among psychologists, by Morgan, James, Stout, Ward, Groos, Baldwin, and others. It is held, by many of those who accept it, to answer certain forcible objections to the universal application of natural selection in its 'direct' form, and so to render the resort to the hypothesis of the 'inheritance of acquired characters'—in the absence of positive evidence for it—unnecessary (cf. HEREDITY). It would seem to be a legitimate resource in the following more special cases.

(1) In cases in which there is possible correlation or association between the organ or function whose origin is in question, and another which is of acknowledged utility: the latter serves as screen to the undeveloped stages of the former.

(2) In cases of CONVERGENCE (q. v.) of lines of descent: certain accommodations, common to the two lines which converge, compel the indirect selection of variations which not only coincide with the individual modifications, but also coincide more and more closely with each other; so in many cases of resemblance due to similarity of function (cf. MIMICRY, 1) and of resemblance in habit and attitude (cf. MIMICRY, 4).

(3) In cases of divergent or POLYTYPIC EVOLUTION (q. v.): two or more lines of variation, being equally available as supports to

an essential accommodation or as co-operating factors in it, are therefore both preserved, although they carry, when developed, each its own structural form. There are many cases in the animal world of ANALOGOUS ORGANS (q. v.) which are yet not HOMOLOGOUS (q. v.)—organs of divergent origin but of common function, and possibly of common appearance—the rudiments of which may have owed their common and indirect selection to a single more general utility.

Or, again, two or more different accommodations may subserve the same utility, and thus conserve different lines of variation. To escape floods, for example, some individuals of a species may learn to climb trees, while others learn to swim. This has been recognized in Gulick's *Change of Habits* as a cause of segregation (cf. ISOLATION) and thus of divergent evolution.

(4) In cases of apparent permanent influence, upon a stock, of temporary changes of environment, such as transplantation: the direction of variation seems to be changed by the temporary environment, when there is really only the temporary indirect selection of variations appropriate to the changed environment. For example, it is possible that plants undergo quick changes by indirect selection when transplanted, the effects of this selection of variations continuing a longer or shorter period after return to the original conditions of life, especially when the original environment does not demand their prompt weeding out. This is one of the cases most often cited as favouring the hypothesis of Lamarckian inheritance. (Osborn, however, thinks there is not enough time in these cases for the operation of organic selection.)

(5) In all cases of conscious or intelligent, including social, accommodation. In these cases conscious action directly reinforces and supplements congenital endowment at the same time that there is indirect selection of the variations which intelligence finds most suited to its needs. Thus congenital tendencies and predispositions are fostered. The influence of orthoplastic family life is well illustrated by Headley (as cited below). This is seen also in the rise of many instincts, for the performance of which intelligent direction has gradually become unnecessary; see the use of the principle in an independent way by P. Marchal (*Rev. Scient.*, Nov. 21, 1896, 653), to explain the origin of the queen bee. See INSTINCT.

Indirect selection applies also to the origin

of the forms of emotional expression (e. g. Darwin's classical case of the inherited fear of man by certain birds in the Oceanic Islands: cf. Darwin, *Descent of Man*, chap. ii) which are thought to have been useful and, in most cases, intelligent accommodations to an environment consisting of other animals. In man also we find reactions, e. g. of bashfulness, shame, &c., largely organic, whose origin it is difficult to explain in any other way, unless we admit the inheritance of acquired characters. It is also recognized that social action by animals (e. g. the more or less intelligent herding) was often of direct utility and caused their survival until the corresponding instincts became fixed.

It also works another way, as Groos shows: an instinct is broken up and so yields to the intelligent performance of the same function, by variation towards the increased plasticity and 'educability' which intelligent action requires. In this way another objection to Darwinism is met—that which cites the difficulty of securing the modification and decay of instincts by natural selection alone.

(6) In this connection it has also been pointed out that with the rise of intelligence, broadly understood, there comes into existence an animal TRADITION (q. v.)—treated also in the literature under the names 'social heredity,' 'imitation,' &c.—into which the young are educated in each succeeding generation. This sets the direction of most useful attainment, and constitutes a new and higher environment. It is with reference to this, in many cases at least, that instincts both rise and decay: decay, when plasticity and continued relearning by each generation are demanded; rise, when fixed organic reactions stereotyped by variation are of most use. So there is constant adjustment, as the conditions of life may demand, between the intelligent actions embodied in tradition, and the instinctive actions embodied, through natural selection, in inherited structure; and this is the essential co-operation of the two factors, accommodation and variation, as postulated by the theory of organic selection. The line of acquired accommodations takes the lead—variations follow. This is very different from the view which relies exclusively upon the natural selection of useful variations in this or that character; for it introduces a conserving and regulating factor—a 'blanket utility,' so to speak—under which various minor adaptations may be adjusted in the organism as a whole. Of course, the selection

of the plasticity, required by intelligence and educability, is by direct natural selection; but, inside of this, the relation of the intelligence to the specific organic characters and functions is the one of 'concurrence' which organic selection postulates.

(7) It is a factor of stability and persistence of type as opposed, e. g., to the fatal result of disadvantageous variations (Wallace); since the individual accommodations may compensate in a constantly increasing way for the loss of direct utility of the character in question. This is notably the case with intelligent accommodations. These piece-out obstructed, distorted, or partial instincts or other functions, and modify the environment to secure their free play or to negative their disadvantageous results. This carries further the advantage which Weismann (*Romanes Lecture*) has claimed for INTRASELECTION (q. v., and see below).

(8) It secures the effectiveness of variation in certain lines, not only by keeping alive these variations from generation to generation, but also by increasing the number of individuals having these variations in common, until they become established in the species. It thus answers the stock objection to natural selection (cf. e. g. Henslow, *Natural Science*, vi, 1895, 585 ff., and viii, 1897, 169 ff.) which claims that the same variation would not occur at any one time in a sufficient number of individuals to establish itself, except in cases of great environmental change or of migration (cf. MUTATION). Organic selection shifts the mean of a character, and this changed mean is what natural selection requires (cf. Baldwin, *Amer. Natural.*, as cited below, and Conn, *The Method of Evolution*, 75 f.).

(9) It is a segregating or isolating factor, as is illustrated under (3) above. Animals which make common accommodations survive and mate together. In the presence of an enemy, those animals of a group which can run fast escape together; those which can go through small holes remain likewise together; and so do those hardy enough to fight.

As to the possible universal application of organic selection, it would seem to depend upon whether there are any cases of congenital characters maturing without some individual accommodation due to the action of the life conditions upon their plastic material. Certain recent writers (Driesch, Delage, Ortman) deny that any characters are entirely congenital, or 'congenital' at all in the current sense of the term which contrasts them with

'acquired' characters (cf. ACQUIRED AND CONGENITAL CHARACTERS). It would follow that in all cases those variations in which the most fortunate combination of innate and acquired elements is secured would survive under natural selection; and this would mean that organic selection is universal. In the words of Groos (*Play of Man*, Eng. trans., 373), 'organic selection may possibly be applied to all cases of adaptation (Anpassung)'; the question remains, therefore, in determining the scope of the principle, whether there are any characters which are not in some measure acquired in the individual's development.

This point of view follows naturally from the position taken by the school of so-called organicists (see Delage, *Structure du Proto-plasma*, &c., 720), who insist in various ways upon the part played by the organism itself in evolution. The writers of this school, however, either hold to Lamarckian inheritance (Eimer), to a form of self-development (Driesch; called 'auto-régulation' and 'auto-détermination' by Delage), or to INTRA-SELECTION considered as repeating its results anew in each generation (Roux, Delage). In the exposition of this last view, Delage used the term 'sélection organique' for intraselection (loc. cit., 725, 732); and Weismann (*Romanes Lecture*) combines intraselection, which 'effects the special adaptation of the tissues . . . in each individual' ('for in each individual the necessary adaptation will be temporarily accomplished by intraselection'), with his hypothesis of GERMINAL SELECTION (q.v.). 'As the primary variations,' says Weismann, 'in the phyletic metamorphosis occurred little by little, the secondary adaptations would probably, as a rule, be able to keep pace with them. Time would thus be gained till, in the course of generations, by constant selection of those germs the primary constituents of which are best fitted to one another, . . . a definite metamorphosis of the species involving all the parts of the organism may occur.' In this passage (which has been quoted by Osborn and others to show that Weismann anticipated the principle of organic selection) Weismann recognizes the essential co-operation of variation and modification which organic selection postulates, but he reverses the order of these factors by making germinal variations (in the words italicized above by the present writer) the leading agency in the determination of the course of evolution, while individual accommodation and modification 'probably keep pace with them' (the primary

variations). The writers mentioned above, however, who originally expounded organic selection, rely upon 'coincident' variation to 'keep pace,' under the action of natural selection, with individual accommodation; which last thus takes the lead and marks out the course of evolution. The hypothesis of germinal selection, which is essential to Weismann's view, is not at all involved in theirs. In the words of Lloyd Morgan, who indicates substantially the relation between Weismann's views and his own as that given above: 'Natural selection would work along the lines laid down for it by adaptive modifications. Modification would lead; variation follow in its wake. Weismann's germinal selection, if a *vera causa*, would be a co-operating factor and assist in producing the requisite variations' (*Habit and Instinct*, 318). De-france says on the same point (*Année Biol.*, iii, 1899, 533): 'He (Weismann) has made use of his personal hypotheses on germ-plasm which are not universally admitted, while the conception of L. Morgan and Baldwin avoids this stumbling-block by not closing inquiry into the processes which enter into play. It is true that this leaves it an hypothesis; but it is nevertheless true that it offers an intelligible solution of one of those problems which appear on the surface to constitute the most insoluble of enigmas.' Osborn brings into play the further factor of 'determinate variation,' which if true would be analogous in its rôle to Weismann's germinal selection (see Osborn, *On the Limits of Organic Selection*, as below). He also holds that 'there is an unknown factor in evolution yet to be discovered.'

Organic Sensation: Ger. *Organempfindung*; Fr. *sensation interne*; Ital. *sensazione organica* (or *diffusa*). A sensation whose adequate stimulus is a change in the state of a bodily organ, i.e. a physiological (as contradistinguished from a physical) process.

The organic sensations fall, so far as they are known, into the following groups:—

(1) MUSCULAR SENSATION (q.v.): sensations from muscle, tendon, joint.

(2) Alimentary sensations: hunger, thirst, nausea.

(3) Sexual sensation: a single, unnamed quality.

(4) STATIC SENSATION (q.v.): dizziness. To these may perhaps be added the following:—

(5) Respiratory sensations (distinct qualities doubtful).

(6) Circulatory sensations: 'pins and needles,' itching (possibly), tingling, &c., arising from conditions of the blood-circulation, which may contain a specific quality.

The organic sensations are psychologically important (a) for the theory of feeling and emotion (James-Lange theory), and (b) for the theory of recognition and memory (Külpe's recognitive mood, Ribot's affective memory, &c.). Cf. COMMON SENSATION. It may be noted that the obscurity of the organic qualities is the reason for, and partial justification of, a 'functional' classification of SENSATION (q.v.).

Literature: MACH, *Bewegungsempfindungen* (1875); RICHET, *Recherches expér. et clin. sur la sensibilité* (1877); KRÖNER, *Körperliches Gefühl* (1887); KÜLPE, *Outlines of Psychol.*, 140; WUNDT, *Physiol. Psychol.* (4th ed.), i. 284; HAMILTON, *Lects. on Met.*, ii. 154 ff.; BEAUNIS, *Les sensations internes*; TH. RIBOT, *Maladies de la personnalité* (1888); *Psychol. des sentiments* (1896). (E.B.T.)

Organism [Gr. *ὄργανον*, an organ]: Ger. *Organismus*; Fr. *organisme*; Ital. *organismo*.

(1) A living being: see the following topic.

(2) A totality whose various parts or ele-

ments are related to each other according to some principle which is derived from the whole itself, and hence is internal and not external, necessary and not accidental. A system. Cf. ORGANIC.

While the Greeks use the term in quite another sense from the moderns, the idea, even in its generalized philosophical use, was quite familiar to them. Plato regarded the world as an animated whole—as *ζῶον*. With Aristotle the end or form animates all potentiality or matter in such a way as to keep it moving towards perfection, and thereby gives it order. In living beings, this appears in the continual higher stages of articulation (*διάφρασις*). Thus the form is the inner life of nature, as distinct from an external arrangement. In this sense, Aristotle applies the notion (not the term) organism, or a whole ordered and moving from an internal principle of causality, to the state, since the individual gets his social life only through his immanent connection with the whole. The Stoics expressly declare the world to be *σύνολον*, a living organized whole; and ethically they proclaim that the individual is not a part (*μέρος*), but a member (*μέλος*) of the universe. The conception on the social side passed into Christianity in the conception of the Church as the mystic body (*corpus mysticum*) of Christ. In the middle ages, the paralleling of the state and the living body is common, and John of Salisbury undertakes to find a part of the body corresponding to every part of the state (see Eucken, *Grundbegriffe d. Gegenwart*, 157). Herder, in the 18th century, is most active in reviving a conception of nature as a living whole, working according to an internal principle, through a continuous series of manifestations. Kant gives the conception a clear-cut definition (see ORGANIC), but gives the idea only a subjective validity. Schelling, however, gives the term a completely objective meaning, applicable to the universe itself. Through his followers it becomes a favourite term to designate the principle of philosophies which regard the world as moving from intrinsic principles, and as producing its effects after the manner of an immanent life and intelligence (*Syst. d. trans. Idealismus*, 261).

Spencer has recently used the term in a generalized sense in recent English thought, as in his assertion that society is an organism. On discussions of this point, however, there is ambiguity—organism is sometimes used as analogous to the organs (or functions) of an

animal body; at other times, in its logical sense, of a coherent whole, systematized by an internal principle. Cf. SOCIAL ORGANISM.

Literature: see ORGANIC, and SOCIAL ORGANISM. (J.D.)

Organism (in biology). A discrete body, of which the essential constituent is living protoplasm. The term originally indicated the recognition of organization as essential to life, and as opposite to unorganized or dead matter. Cf. LIFE, and LIVING MATTER. (C.S.M.)

Organization: Ger. *Organisation*; Fr. *organisation*; Ital. *organizzazione*. A more or less systematic arrangement of relatively separate parts in a whole suited to fulfil any sort of function.

The term has applications, with varying degrees of definiteness, in the phrases 'mental organization' (in which the systematic determination of the flow of the mental life is characterized), SOCIAL ORGANIZATION (q.v.), 'organization of knowledge' (the adjustment, in a philosophical view, of the details of knowledge as contributed by the different sciences).

The shading of meaning which distinguishes organization from ORGANISM (q.v.) is in the direction of relative looseness of relation as between the parts and the whole, and relative lack of independence of conditions external to the system. An organization is 'formed,' 'controlled,' 'modified,' 'worked,' &c.; to an organism these predicates are not applicable. Moreover, we do not speak of the 'organs' of an organization, but of its 'members'; each being at once less dependent upon the whole, and less necessary to it. Hence the preference for 'mental organization'; it leaves open the question whether mind has the inherent principle of its own systematic process which is necessary to an organism.

In the adjective organic this difference disappears, and much ambiguity arises therefrom. The term 'organized' is preferable to characterize an organization, organic being limited in its application to organisms proper. (J.M.B.)

Organization (industrial): Ger. *Unternehmensform*; Fr. *organisation industrielle*; Ital. *ordinamento industriale*. The immaterial advantages for production which have attended the growth of capital.

Reckoned by Walker and Marshall as an agent or factor in production, co-ordinate with land, labour, and capital. (A.T.H.)

Organon [Gr.]: the same in the other languages. Since neither the Aristotelian definition of a speculative science, nor of a practical science, nor of an art, seemed to suit

logic very well, the early peripatetics and commentators denied that it was either a science or an art, and called it an instrument, *ὄργανον*; but they did not precisely define their meaning. It was negative chiefly. The collection of Aristotle's logical treatises, when it was made, thus came to be called the Organon.

Francis Bacon, disapproving of Aristotle's methods, wished all that to be laid aside; and he consequently called his work, which was designed to be a guide for establishing a systematic inductive procedure, *Novum Organum*. The name was afterwards imitated by sundry authors, as Lambert in his *Neues Organon*, and Whewell in his *Novum Organum Renovatum*. (C.S.P.)

Oriental Philosophy (and **Religion**). The group of religions treated in the following article includes those of Egypt, Babylonio-Assyria, Persia, India, China (in geographical enumeration from west to east).

Among these nations India alone can be said to have produced schools of philosophy analogous to those of Greece, though the ethical teachers of China have good claims to rank with the thinkers of Europe. In the religions of Egypt, Babylonio-Assyria, and Persia, the philosophical element does not reach self-conscious expression, it remains entangled in mythology. But all religions really involve a primitive philosophy. They attempt to give some kind of rational explanation of the world of objects and of life by which they are confronted. This is obviously the case even in the animistic stage, and it is no less so with the more elaborate systems which have emerged out of that rank, and acquired more or less consistency of higher thought. Only this aspect is here sketched. Questions of ritual and hierarchical organization are only touched where they involve the form and significance of belief¹.

I. Egypt. The wisdom of Egypt was famous in ancient Israel, and the Greeks again and again expressed their indebtedness to it. Thales, Pythagoras, and Plato were said to have studied there. Aristotle regarded it as the home of mathematical lore. The author of the treatise on 'Isis and Osiris,' reckoned among the works of Plutarch, indicates the interest which the eclectic philosophers of the Roman Empire still felt in its venerable symbols.

¹ In the spelling of proper names and technical terms, the diacritical marks usually employed by scholars are here abandoned, and foreign words are represented in the English alphabet.

Since Young and Champollion discovered the clue to the hieroglyphics, an immense wealth of material has been derived from the inscriptions of temple and tomb; yet the problem of the real character of ancient Egyptian religion remains exceedingly obscure. Putting aside the difficult questions of the origins of the Egyptian race and culture, it may be said that the earliest texts present already the chief forms of its pantheon. Even at the outset it exhibits a quasi-monotheism (for explanations of this phenomenon see below). In spite of the conservatism of its priesthoods, its history shows occasional vicissitudes, as one centre after another acquires prominence or sinks into decline. Some features in the cultus, such as the numerous forms of animal worship, the prodigious number of gods of particular functions (e.g. child-birth, child-naming, child-nurture, the ripening of the corn, &c.), and the constant use of magic, connect Egyptian religion with Animism. Of a higher order are the elemental gods, the earth and sky, the sun and stars, the Nile. On this side, the number of the gods was perpetually being increased by the amalgamation of local cults, and the occasional incorporation of foreign deities, for polytheism can always tolerantly accommodate new comers. In this view contradictions and inconsistencies may be explained as due to prior diversities of race (Petrie). On the other hand, from the earliest times, another tendency towards henotheism, or even monotheism, may be traced with equal clearness. The chief question for philosophy concerns the value of this tendency; and different answers are given by different investigators.

The word 'god' occurs both in the sing. *neter* (or *nuter*), and in the pl. *neteru* (or *nuteru*). De Rougé and Pierret associated it with the idea of continuous renewal, so that God is 'the imperishable' (Tiele); Renouf finds in it the notion of power; Brugsch unites both, affirming it to mean 'the active energy which produces and creates in regular recurrence, imparts new life to things, and restores their youthful vigour.' But Maspero believes the word to be so old that its original sense cannot be determined, Renouf's meaning 'the mighty' being derived and not original (if it ever existed). The early phrases in which the singular occurs are such as these: 'Thou existest at the side of God,' 'He weigheth words, and behold God hearkeneth unto the words,' 'Not known are the things

which God will do,' 'What is loved of God is obedience, disobedience God hateth' (cf. others still more striking, given without date, Brugsch, *Mythologie*, 96-9). But against these may be set other phrases in which one deity after another is called 'The one and only God'; such is Tumu at Heliopolis, or Anhûri-Shû at Thinis. The clue to this latter conception is to be found in the local cults prevailing in different territorial divisions. Different cycles of myth gathered round them, and one or another rose into solitary pre-eminence before the eyes of his worshippers, like Ptah at Memphis, Ra at Heliopolis, &c. Sometimes several divine forms were united, as though to express the unifying tendency. At Heliopolis, Ra (the sun-god) was viewed theologically as Tumu, and Tumu was placed at the head of the great cosmogonic scheme which conceived the universe as produced with the help of four pairs of gods and goddesses mysteriously derived from him. Tum-Ra was thus 'the only god,' who had created himself and formed his own name, who could say, 'I am yesterday, I know to-morrow' (*Book of the Dead*, xvii). This arrangement was known as an 'Ennead' (*paût nûtirû*), and was widely copied elsewhere. Even tendencies towards monotheism thus had always a background of mythology. Once only was it attempted to make the state-religion monotheistic, when (about 1450 B.C.) Khu-en-Aten (Amenophis IV) endeavoured to establish the exclusive worship of the solar disk Aten-Ra as the supreme symbol of deity, and even tried to eliminate from the inscriptions the names of his rivals (see the splendid hymn translated by Wiedemann, *Religion of the Ancient Egyptians*, 1897, 40). But this effort to select one of the old nature-gods for a kind of transfiguration was soon undone. The brilliant triumphs of the Theban monarchy gave prominence to the majestic form of Amun-Ra, round whom gather some of the noblest of the quasi-monotheistic hymns. Yet he, too, passed, though he could still serve in the time of Darius as the centre of unity. In a hymn of this date on the temple of El-Kargeh in the great oasis he is identified with heaven and earth, with fire, water, and air. He is the giver of life and increaser of all things. Shu, Tefnu, Mut, and Khons are his forms: 'each god has assumed thy skin.' Well may Birch, in translating the hymn (*Trans. Soc. Bibl. Archaeol.*, v. 1877, 294), declare it to be 'the nearest approach to the monotheism of one deity manifested by

different types in the chief cities of Egypt.'

The cosmogonic speculations chiefly rest on the belief introduced to the Greeks by Thales that the beginning of all things lay in the primeval waters (Nu or Nun). One set of myths represents earth and sky lying like lovers within them. The story of their separation and the elevation of the sky belongs to the same class of savage tales as that of the New Zealand Rangi and Papa. Another group gathers round the widespread conception of the world-egg. Various gods, such as Ptah the 'former,' Khnum the 'moulder,' are invested in different cycles with creative functions. A further set of myths embodies the ideas of the conflict of the powers of light and darkness, first physical and then moral. The order of nature was mythologically concentrated in two figures, Thoth and Maât. Thoth was originally a moon-god, and hence came to be god of time. He is son of Ra (the sun-god), but also 'the unborn,' 'the one God,' 'the alone only One,' who creates by the word, or rather simply by voice. He is the founder of the sciences connected with space and time (e.g. astronomy and land measurement); he is also the god of letters and revelation, and the guardian of law. Maât (from *mā*, to stretch out) embodies the ideas of right, truth, justice, order. She is the daughter of Ra, sister and consort of Thoth, 'lady of heaven,' 'queen of the earth,' so that the universe is under her control. The gods are said to exist by, or upon, her. She is even 'queen of all the gods and goddesses,' so that order is more than 'heaven's first law,' it is itself the very sovereign of the world. This idea must be combined with that of perpetual renewal, of everlasting continuity through incessant change, which seems the philosophical essence of Egyptian religion. 'I am that which was, which is, and which will be,' ran the inscription in the name of the great goddess of Sais, according to the *De Iside*, 9, 'and my veil no mortal yet hath lifted.'

Egyptian psychology is of course at a crude stage. The doctrine of man and his nature is chiefly comprised in the texts dealing with the dead, especially the so-called *Book of the Dead*, a collection of chapters of various ages, some embodying extremely ancient ideas, intended to guard the deceased on his journey through the perils of the next world. The various elements of a human being are enumerated by Budge (*Papyrus of Ani*, 1895, pp. lviii-

lxix) thus: (1) The physical body, *khat*. (2) The spiritual body, *sāhu*: this can ascend into heaven and dwell with the gods. (3) The heart, *ab*, seat of life, and centre of good and evil thoughts. (4) The double, the genius or *εἰδωλον*, the *ka*: this received the funeral offerings and dwelt in the statue of the deceased in the tomb, as the *ka* of a god inhabited the statue of the god. Petrie identifies it further with 'the inner mental consciousness and powers of thought.' (5) The soul or *ba*, represented as a human-headed hawk, which could revisit the body and consume the funeral-meats, but also dwelt in heaven and shared the life of the gods. (6) The shadow or shade, *khaibit*, which again was free to move about. (7) The *khu*, 'shining' or translucent, sometimes identified with 'intelligence,' or otherwise interpreted as 'spirit': this also, like the shadow and the *ka*, belonged to gods as well as men. (8) The *sekhem*, enumerated with the *ka* and the *ba*, placed among the *khu*'s, sometimes rendered 'power,' sometimes 'form.' (9) The name, *ren*, also believed to exist in heaven. The conception of the destinies of the dead seems to have been largely moulded on the analogy of the journey of the sun through the hours of the night, along the valley of another Nile, whether in an underworld or a world alongside of this to the north. The identification of the deceased with Osiris (whose myth was united with that of Ra) takes place at an early period, first in the person of the king, and then for all. And the whole process receives a remarkable ethical development under the Theban monarchy of the 'New Empire,' when the famous judgment-scene is added to the *Book of the Dead* (chap. cxxv), and the soul is solemnly weighed in the 'hall of Double Justice (Maât)' before the throne of Osiris. The confessions then put into the mouth of the soul before the Forty-two Assessors throw an important light on the moral notions of ancient Egypt before the days of the Exodus.

Egyptens (Berlin, 1887); ERMAN's Life in Ancient Egypt (London, 1894); or MASPERO's Dawn of Civilization (London, 1894); CHANTEPIE DE LA SAUSSAYE, Lehrb. d. Religionsgesch. (1897), i. 88-160; PETRIE, Religion and Conscience in Ancient Egypt (London, 1898).

II. Babylonio-Assyria. The study of the ancient civilization of Mesopotamia has shown its immense significance for the culture of the Mediterranean peoples. It touched Egypt, it spread through Canaan, it powerfully influenced Israel. It contributed to the mythology and possibly to some of the cults of Greece; and through the Greeks its primitive science—for instance, the signs of the zodiac—passed into Europe. It supplied much of the demonology of Judaism, and it is possible that some of its cosmic conceptions may have left their traces in Gnosticism. But it can hardly be ranked with Egypt as a mother of philosophies.

When the Babylonian religion comes into view in the fourth millennium B.C., numerous centres of government and of worship have been established in North and South Babylonia, and various elements of nationality have been already combined. The relation of the Semitic immigrant peoples to the previous occupants of the country is still obscure, and the chronological problems arising out of the

attempts to determine the successions of kings are differently settled by different investigators. Concerning Sargon and Naram Sin of Agane, about 3800 B.C., there is general agreement; but whether the priest-kings of Lagash, among whom Gudea figures, preceded or followed Sargon is still under debate. The religion of this age is already developed, and shows traces of the beginnings of organization. But it has not passed beyond the character of polytheistic nature-religion. The deities are revealed in the elemental forces: the moon, the sun, the stars, the courses of the seasons, the three great divisions of the universe—the sky, the earth, and the primaeval waters which surround and bear it up—these are the chief objects of interest, the embodiments of divine powers. At the bottom are magic and witchcraft, an immense multitude of spirits, evil and good. Babylonio-Assyrian religion does not descend as low as Egyptian animal worship; on the other hand, its doctrine of man and his destiny remains much nearer the animistic level, the condition of the wandering double (*ekimmu*) on earth resembling that of the usual disembodied ghost, and the gloomy underworld having no proper ethical character. Such philosophical interest as Mesopotamian religion presents seems rather to lie in its occasional efforts to rise above the fundamental polydaemonism and the polytheism superposed upon it. The term for a god, *il-u*, is identical with the widespread Semitic name which appears in Hebrew as *ēl*, but its derivation is still matter of discussion. A regular feminine was formed, which does not occur in Hebrew, and similarly an abstract *ilūt-u*, god-head or divinity, with which may be compared *anūt-u*, a corresponding abstract from the name *Anu*, the sky-god (Jeremias).

Anu appears already in the inscriptions of Gudea, forming the first member of a supreme triad. He represents the expanse of heaven. Beside him stand Bel, lord of the earth and its forces, and Ea, god of the ocean-deep, which encompasses the earth and lies beneath it. Theological arrangement here begins to be apparent. But though Anu is the supreme lord of all, and the father of the gods, who must obey his commands, he himself takes no leading part, and in the cosmogony mentioned below he is removed by several stages from the actual origin of the world of the gods. Another triad comprised the moon-god Sin, who could even be identified with Anu, the sun-god Shamash, and Ishtar (Venus) or

Ramman ('the thunderer'), god of rain and storm. But under Hammurabi (about 2250 B.C.) Babylon rises into political pre-eminence, and its local deity Marduk, already named in early texts, with the function of god of the spring-sun, is consequently elevated to the loftiest place. Day by day he rises out of the ocean, and so is the son of Ea, and he brings to light the hidden wisdom which lay in the mysteries of the deep. Year by year he wakens the dead to life, and in his character of 'the merciful' he heals the sick, sets free the prisoner, and protects the weak. Not only is he first-born and leader of the gods, he is lord of lords, ruler of the world, whose will heaven and earth obey. Accordingly, in one of the great cosmogonic myths, he is the creator; and he is even called 'god of gods' (Sayce, *Hibbert Lectures*, 501). Not even the rise of Assyria into empire (about 1400 B.C.), and the advent of its great god Ashur to power, overthrew his influence, for the monarchs of Nineveh sometimes made pilgrimage to Babylon. Ashur, indeed, was regarded by the theologians on the Tigris as lord of the world and maker of the earth. He typifies the political unity of the empire over which he presides. The other gods are little more than members of his court, the land bears his name, and the king's enemies are his foes. He is king of all gods, even 'father' who has created them (Sayce, *Hibbert Lectures*, 128). Most striking of all, he is self-existent, for he is 'the creator of himself.' But with the fall of Nineveh in 608 B.C. Ashur passes, and Marduk reappears in supremacy, so that Bel, Sin, Ramman, &c., even sometimes find their functions transferred to him. Marduk almost, if not quite, reaches the elevation of Amun-Ra in Egypt; but the Babylonian thinkers never formulated the Egyptian conception of continuity through change and renewal.

The early cosmogonic speculations were finally embodied in a 'creation epic,' which opens a series of poems in honour of Marduk. Before heaven and earth were named, when no god yet lived, there were only the heaving waters of the deep. The deep is personified as Tiāmat (equivalent to T'hôm, Gen. i. 2), primaeval mother of heaven and earth. By a kind of evolutionary process the first pair of gods, Lakhmu and Lakhamu, are 'built' out of the chaos, and from them after many days two more, Anshar and Kishar, the male and female principles of heaven and earth. Then follow Anu, Bel, and Ea, and in due

course Ea's son Marduk. Tiāmat dreads the growing power of the gods, and prepares for a great struggle by producing a brood of monsters to defend her. The elder gods are powerless for the conflict; Anu and Ea fail; but Marduk, installed as king, advances armed with the weapons of the storm, and attended by seven fatal winds. Tiāmat is caught in his net and slain; Marduk splits her gigantic carcase into two parts like a flattened fish, and one half is made into a covering for the heavens to hold back the waters. The earth is then constructed as a hollow hemisphere beneath the upper vault, spanning the great deep; the districts of the mighty Three—Anu, Bel, Ea—are marked out, and the courses of the heavenly bodies are fixed. The tablet describing the origin of the human race has not been preserved, but at the close of the series the children of men are enjoined not to forget Marduk, 'who created mankind out of kindness towards them, the merciful one with whom is the power of giving life.'

As might be expected with a people so observant of the heavens, the cosmologic speculations are pervaded by a strong sense of law and order, connected in particular with Sin (the moon-god) and Shamash (the sun), the latter especially being ethicized as 'the judge of the land, and the arbiter of its laws.' The Babylonian pantheon does not present any exact equivalent to the Egyptian Maāt, but the Thoth of the Nile finds a counterpart in the Mesopotamian prophet-god Nabu, 'proclaimer' or 'herald.' He is the impersonation of wisdom; son of Marduk, in the later theological system, he is *ilu tashmīt-u*, 'god of revelation (causing to hear).' So he is the god of inspiration, and the source of science and literature. In this capacity Tashmit-um (feminine abstract) becomes his consort. And in virtue of the sovereignty of thought Nabu becomes for Nebuchadrezzar 'the upholder of the world,' 'the general overseer,' and his temple is 'the house of the sceptre of the world.' It is the mythological expression of the first principle of philosophy.

Literature: a very careful bibliography will be found in JASTROW'S *Religion of Babylonia and Assyria* (Boston, 1898).

III. *Persia.* Neither the Egyptian nor the Babylonian religion has any present representatives. But the followers of Zoroaster, known as Parsees in Western India, still preserve the sacred books in which the ancient teaching is embodied. First brought

to light by the adventurous French scholar Anquetil du Perron (1761), they have been supplemented by the study of additional literature in the same religious succession, and a large amount of material is now available. The sacred books are now known by the name of *Zend Avesta*. The term Avesta, which cannot be traced back further than the Sassanian kings (beginning 226 A.D.), denotes the sacred text, *Zend* being the commentary or explanation. The books so designated form no proper whole; they are the remains of a much larger literature. Their contents are various, liturgies and laws being mingled together. They are divided into three groups: (1) *Yasna* (Sansk. *yajña*, sacrifice), the principal liturgical book, in 72 chapters, used by the priests at sacrificial ceremonies in honour of various deities; (2) *Vispered* (*Vispe Ratavo*, 'all the chiefs'), in 24 chapters, based on the *Yasna*, and containing invocations to the spiritual heads; (3) *Vendidad* (*Vi-daeva-data*, 'law for the enemies of the daevas or evil spirits'), in 22 chapters, a priestly code of purifications and ecclesiastical penance.

The age of this collection is a problem of extreme obscurity. In its present form it is only the survival of a much more extensive mass, probably gathered together under the Sassanian kings, especially Shapur II, about 325 A.D. Much ancient literature was then believed to have perished, tradition attributing the destruction to Alexander the Great. The oldest portion is found in the five *Gāthās*, discourses of revelation and exhortation in metrical style and archaic language, now arranged in *Yasna*, xxviii-lviii. The evidence of date is scanty and uncertain. Considerations of political circumstances, and comparison with the usage of the cuneiform inscriptions of the Achaemenian kings at Persepolis, Behistun, &c., especially in the treatment of the divine name Ahura Mazda, lead to the view that the materials of the younger part of the Avesta can hardly be later than 800 B.C., and the *Gāthās* may be two centuries earlier (Tiele). Haug placed the *Gāthās* about 1200 B.C., Mills possibly as early as 1500, or 1200-900. On the other hand, de Harlez is in favour of a date from 500 B.C. onwards; and Darmesteter (whose views have found no support) finally supposed them to be dependent on Gnosticism and the Philonic Platonism in the middle of the 1st century of our era. The antiquity of much of their doctrine is

attested by the Greek writers, notably Theopompus in the 4th century B.C. Further materials are found in the *Bundahish*, a work of the Sassanian period, which repeatedly quotes older texts, and other Pehlevi literature of still later date.

The Avestan language and its mythological and ritual terminology at once disclose their relation to those of the *Vedic Hymns*. A number of equations can be immediately established, such as *ahura* and *asura*, *daeva* and *deva*, *haoma* and *soma*, *Yima* and *Yama*, *Mithra* and *Mitra*, *Vayu* and *Vāyu*, *Aramaiti* and *Aramati*. The objects of Avestan homage are designated the *yazatas* or 'worshipful ones' (Sansk. *yajata*); and behind the 'Lord all-wise' of the Zarathustrian teaching, with his associated 'immortals,' are the sun, moon, and stars, the fire and the waters, and other elemental powers, connecting the ancient religion with the early nature-cult of the eastern Aryans. And this in its turn sprang out of a still more ancient polydaemonism, survivals of which may be found in the crowds of good and evil spirits. Among the protectors of the living are the patron-spirits of the dead, the *Fravashis*, a conception which is generalized and extended from the house to the village, the district, and the province, and affects even the unborn. Originally analogous to the Vedic 'fathers,' the term comes to include the genius or ideal type of a whole nation, and can be applied also to 'the Lord' himself. Other factors sprang from the nomadic life of the ancient people, the cow and the dog having a special place in mythology and sacred law. And yet others seem to have been derived from foreign contact, like *Anāhita*, a goddess later associated with *Mithra*, but now recognized as of Semitic origin.

It is upon this field that Zoroaster (*Zarathustra*) appears. The *Gāthic* hymns represent a period of religious conflict. The people are divided between two hostile cults. 'Hard by the believer in Ahura,' complains the prophet, 'dwells the worshipper of the daevas.' The first are cattle-breeders, to whom the care of the cow is a sacred duty; the second maltreat it, and slaughter it in their sacrifices. Zoroaster is in the thick of the struggle. He is a *zaotā* (Vedic *hotā*) or priest; he is *mañthran* (cf. Vedic *mantrin*), endowed with the holy word; he is *dūta* (Sansk. *dūta*), 'sent,' a messenger or apostle. The scene is in North-east Iran, in the district known as *Atropatênê* (modern Azerbaijan),

between the S. Caspian and Lake Urumiah: his family name is said to have been Spitama: he has a wife and sons and daughters. Later legends embellish his career, but (save for his colloquies with Ahura) the oldest texts contain no wonders. His historic personality has, however, been questioned (Tiele, Kern, Darmesteter), yet it is plain that the movement of reform indicated in the *Gāthās* (assuming their antiquity) must have had some leaders. Such guidance seems sufficiently supplied by Zoroaster; and though all detail is uncertain, some dominant mind is required to explain the new thought; only some personal energy—even with a priestly circle to support it—could have communicated the original impulse. Jackson, following Pehlevi tradition, thinks it safe to date his birth in 660 B. C., and his death in 583 B. C., at 77 years of age. This hardly seems to give time for the linguistic changes already obvious in the inscriptions of Darius; and even if the Greek date (Xanthus the Lydian, about 450 B. C., puts Zoroaster 6000 years before Xerxes) be explained by assuming that the statement refers to the formation of the spiritual body of Zoroaster (as described in the *Bundahish* many centuries later), the philological argument drawn from the general character of the language remains untouched. West therefore (*S. B. E.*, xlvii. Introd. § 78) concludes that 'at present we have no really historical information about the origin of Zoroastrianism, and must still consider it as decidedly prehistoric.'

The supreme figure in Zoroastrianism is that of Ahura Mazda, 'lord all-wise.' Knowledge, holiness, beneficence, creative power, sovereign sway, and sustaining energy are all united in him (see the two lists of his titles in *Yasht*, i, *S. B. E.*, xxiii. 24-8). He is 'bright' and 'glorious,' but no form is ever ascribed to him. He is addressed as *Mainyu Spenista*, 'most bountiful spirit', and he is 'maker of the material world.' He is revealed in light; he puts on the sky as a garment (*Yasna*, xxx. 5, i. 1; *Yasht*, xiii. 3), and the stars are poetically described as his 'body' (*Yasna*, xxxvi. 6). But Herodotus observed that the Persian worship was conducted without temples or images, 'because they do not think that the gods have human forms as the Greeks do.' Associated with him are six (or seven) 'immortal holy ones' (*Amesha-Spentas*): *Vohu Manah*, 'good

thought'; *Asha Vahista*, 'most excellent righteousness'; *Khshathra vairya*, 'the kingdom of the divine will'; *Spenta Armaiti*, 'holy piety'; and the sacred pair *Haurvetat* and *Ameretat*, 'health' or 'perfection' and 'immortality.' With these Ahura seems sometimes himself to be reckoned; but the number seven is otherwise completed by *Sraosha* (lit. 'hearing'), the angel of Obedience. These ideal powers play a great part in Zoroastrianism. Such are Daena, impersonation of sacred law, who belongs to the heavenly creation, produced with the light; and *Mañthra Spenta*, the Holy Word, applied to the revelation issuing from Ahura's mouth. And such in another connection were the *ratus*, the types or ideas of all classes of beings or objects, ranged in hierarchic order, like the grades of imperial administration, the highest being identified with the *Amesha-Spentas*. Among these *Vohu Manah* and *Asha Vahista* form with Ahura an inner group of three. The first closely resembles *Spenta Mainyu*, which is sometimes identified with Ahura, and sometimes regarded as a kind of emanation from him, or again as something possessed by him. The second is philologically equivalent with the Vedic *Rita* (see below, *India*), and expresses the idea of order in the universe as the foundation of righteousness. Mythologically, Asha is conceived by Ahura for the worlds; or, again, Ahura is the creator of Asha 'when his all-glorious conceptions clothed themselves in the stars'; and the Mazdayasnian confession of faith declares its trust in Ahura, 'whose is Asha, whose are the stars, in whose lights the glorious beings and objects are clothed.' Asha has other functions, ritual and moral; the cosmic, the ceremonial, and the personal being after all only different aspects of that order which, to the ancient Iranian, was more than 'heaven's first law,' and could be identified with deity himself, 'My name is Asha Vahista—most excellent righteousness' (*Yasht*, i. § 7).

Over against the realm of Asha, chosen by the Holy (or Bountiful) Spirit, is the sphere of the 'Lie.' What is the relation of the opposing powers? It is difficult to state it with precision, for the expression of it is poetical, and not philosophic; and it is variously represented in the different parts of the Avestan texts. In the *Gāthās* it seems to have its root in the moral antithesis of good and evil as a fact in human life. This is carried back indefinitely to

¹ The term *spenta* has the meaning at once of beneficence and holiness.

a primaevial conflict, when twin spirits strove for the better and the worse in thought, word, and deed (*Yasna*, xxx. 3). As they met, they produced life and unlife¹, determining how at last there should be for the wicked the worst state, and for the righteous 'the best mind.' Then the wicked one chose the evil, but the most bountiful Spirit chose Asha and 'righteousness.' The world is thus the scene of continuous struggle between the most holy spirit (*Mainyu Spenista*) or Ahura and the evil spirit (*Añra Mainyu*). As the essential being of Ahura is truth, symbolized by light, so his counterpart is pre-eminently 'the lie' (*druj*), and his kingdom is darkness. In the *Gāthās* this is altogether conceived in the moral and spiritual realm. Night, which discloses the stars, is a part of the world's order; and accordingly the prophet, preparing to sing Ahura's praise, asks: 'Who as a skilful artisan hath made the lights and the darkness? Who made sleep and wakefulness? Who spread the auroras, noontide and midnight, monitors to discerning men, duty's true guides?' (*Yasna*, xlv. 5). It was even Ahura who decreed the penalties on the wicked, as the discerning arbiter who rewards and punishes hereafter. But after a time the moral struggle was found to be reflected in the universe. Disease and death, cold, drought, and hunger, and physical suffering of all sorts, are the creation of *Afira Mainyu*, or are produced by the *daevas*, over whom he rules. The *Bundahish*, accordingly, following earlier authority (cp. *Yasht*, xiii. 77), describes the mode in which the evil spirit endeavours to neutralize Ahura's work. The dualism thus implied, however, is of a very qualified kind. *Afira Mainyu* (who is never accounted for) is neither omniscient nor almighty. He does not know of Ahura's existence till he arises from the abyss and sees the light. And his doom is fixed; at the resurrection his creatures will perish, and he himself also will be destroyed. Philosophy has not been altogether content with these uncertainties, and has attempted in some way to unify the opposing powers. Traces of two modes may here be mentioned. Erroneous exegesis of *Vend.*, xix. 9, suggested the view that both Ahura and *Añra Mainyu* (*Ahriman*) were the joint offspring of a higher being, *Zarvan Akarana*, 'boundless time.' Others, like the *Gayomarthians*, maintained that

Ahriman was in some sense a product of Ahura; and his origin was ascribed to the suspicion which sprang up in Ahura's mind, 'Perhaps an antagonist may arise to oppose me' (*Dabistan*, trans. Troyer, i. 356).

The conflict between the two powers is not everlasting. It was a fundamental postulate of religion that the good must triumph. This is embodied in the Zoroastrian eschatology, which provides both for the individual and for the world. For the human being (see two lists of his immaterial faculties, *Yasht*, xiii. 74 and 149) a judgment is provided immediately after death, with an appropriate allotment to the heavens or hells of good and evil thought, word, and deed. The duration of these awards was limited, but varying gradations of intensity secured a complete moral equivalent for the guilt or merit of the past. A regular chronology was gradually worked out, according to which the world would come to an end after an existence of 12,000 years. The great consummation, the *frashokereti* ('forwards-making,' the renovation which would make the world go forwards), would begin. Inaugurated by a general resurrection, the hour of victory over the *druj* would arrive. The mountains would melt, and the barriers set by the hills would disappear. A purified humanity would become immortal; the evil spirit would be conquered and destroyed; the last recesses in which he had taken refuge would be consumed, and hell would be brought back for the enlargement (or prosperity) of the world. By this means the choice offered by the Supreme Wisdom to the guardian spirits of men at the outset was justified. When he was about to present them to the world he inquired whether they would contend with the Lie-power, knowing that it would perish and they would be given back to the world immortal, or whether they would be protected against it from the outset. And they chose, as he chose for them, to be made capable of warfare, to strive for everlasting life (*Bund.*, ii. 10-1).

IV. **India.** Indian philosophy is organized historically under the influence of Brahmanical orthodoxy in the so-called Six Darśanas ('views' or systems) named below. These, however, only hold the field after the decline of Buddhism, and they represent the issue of long processes of thought which began at an exceedingly early date. Their main problems were metaphysical; ethical theory was always subordinated to practical methods of moral culture; and political conceptions did not exist. But speculation busied itself very early with the fundamental ideas of ontology; and the varying phases of this activity, the interest which it evoked, its influence on social life, and the protests and reactions generated by it, form a most significant if also highly complicated history. Special difficulties arise out of the vastness of the literary product in which this history is contained, and the absence of any proper chronology.

The general succession of the strata of Vedic literature is sufficiently well established, though no definite dates can be assigned. Monumental evidence first becomes available in the reign of Aśoka, 263-226 B.C. (Duff, *Chronology of India*, 1899), whose inscriptions (combined with other materials) make it possible to fix the rise of Buddhism in the latter half of the 6th century B.C. The greater part of the canon of the Three Pitakas belongs to the century and a half following the Buddha's death, and may be ascribed to the period before 300 B.C. Very important evidence for the different tendencies of contemporary thought is to be found in the Buddhist texts, just as later works of other schools abound in proofs of the independence and intensity which marked the pursuit of philosophy in India for more than 2,000 years.

THE **VEDAS.** The beginnings of speculation are to be found already in the hymns of the *Rig-Veda*. The background out of which they emerge is that view of nature held by the peoples of the lower culture. The elemental forces and objects are themselves divine agents—earth and sky, fire and wind, sun and storm—but these have long been personalized, though they have never acquired such marked theanthropic forms as in Greece; and the mythologic process has never connected them so definitely with specific sacred spots as to make their biographies possible from a nativity to a tomb. The germs of philosophical thought may be seen (1) in the attempts at classification of the gods; (2) in the prominence given to conceptions of law and order; (3) in the various modes of relating the Many to the One; and (4) in the different phases of cosmogonic speculation. Thus (1) the determination of the number of the gods at thirty-three seems to reach far back into Aryan antiquity, as it is found also in the *Zend Avesta*, and may be possibly of still wider usage. But these are classed among three zones—the sky, the earth, and the intervening atmosphere (*R.-V.*, i. 139, 11)—though they are not always distributed by the Brahmanical explanations quite in the same way. More important (2) is the emphasis again and again laid on their law-abiding character. The uniformity of nature early attracted attention, and is explained by the decrees or commands (*dharma*, *dhāman*, *vrata*) laid by the gods upon the flow of the rivers, or the movements of the stars; while the ordered course of the world from day to day is mythologically embodied in the *Rita*

(the Zend *asha*), of which the gods are the guardians alike in its physical and its moral aspects, an early synthesis of the highest value reached by poetic intuition. The view of the world's unity (3) implied in the conception of the *Rita* naturally produced various attempts to get rid of the plurality of deities. They were syncretistically united in pairs, Indra-Agni, Mitra-Varuna, &c.; they were generalized as *Viṣve Devas*, 'the gods together'; they were regarded as manifestations of an ulterior reality, 'the One with many names'—'the sages call that One in many ways'—and as such they shared a common deity, *mahad devānām asuratvam ekam*, 'the great asura-hood [Sansk. *asura*=Zend *ahura*] of the gods is one' (or perhaps 'great is the asura-hood of the gods, it is one'). This mysterious One is in turn identified with various principles. Such is *Aditi*, the 'infinite,' who comprehends all space and time, and who is all gods and men. Such is *Prajāpati*, 'lord of creatures,' and other similar forms (cf. *Skambha*, 'support'; *Prāna*, 'vital breath'; *Kāla*, 'time,' in the *Atharva-Veda*). Two terms especially emerge, destined to be of high significance hereafter: (a) *Brahman* (cp. Deussen, *Gesch. d. Philos.*, i. 240-8; Max Müller, *Six Systems*, 68 ff.), conceived as the supreme energy of the universe, comprising finite and infinite, past and future, within it; and (b) *Ātman*, the breath or living principle, and so the 'self'; sometimes applied to particular deities (*Parjanya*, the fertilizing rain; *Sūrya*, the sun; *Vāyu*, the wind), each as the 'self' of the gods, or dimly apprehended as the ultimate Brahman. Lastly (4) cosmogonic speculation is busy with the origin of the universe. It is attributed to *Viṣvakarman*, 'maker of all things,' or to *Prajāpati* in the shape of the 'Germ of golden light' (according to the addition in *R.-V.*, x. 121, 10), or to *Purusha*, the cosmic 'Man' whose sacrifice produces the heavens and the earth and all that is therein. Most famous of all is the effort of the seer (*R.-V.*, x. 129) to carry thought back to the primaeval darkness, when there was neither *sat*, 'what is,' *rō ōv*, nor *asat*, 'what is not,' *rō mē ōv*, neither death nor deathlessness. Then 'that One' was born by the power of heat, and through *Kāma* (hot desire, or love) was at last evolved the world we know.

EARLY BRAHMANISM. Many of the terms which the later schools will freely use may thus be traced back to the speculations which found their way into the Vedic canon ere the collections of the ancient hymns were com-

plete. In the ritual treatises known as the *Brāhmanas*, based upon the sacred texts, *Prajāpati* appears again and again as the emblem of unity, and various myths representing different stages of speculative advance out of the lower culture describe his creative functions. But the great contribution to thought made by the age of early Brahmanism was concerned with the interpretation of human life rather than divine. In the Vedic hymns the destiny of the dead is depicted much on the lines of higher animistic expectations elsewhere. The 'fathers' have passed into the realm of light in the sky; and though the hereafter is not without traces of ethical discrimination, there is no clear principle controlling the dispensations of the future, still less the circumstances of to-day. But the Buddhist texts represent the theory of transmigration as fully developed in the Brahmanical teaching, and as under the strictest moral law. It must, therefore, have been elaborated in the interval; but from what sources? The belief that the souls of the dead pass into animals, and even trees or plants, recurs among many races, and may have been adopted by the immigrant Aryans from the aboriginal peoples (Gough, Rhys Davids, Garbe). Apart from the hostility shown to them and their beliefs in the Vedic hymns, this hypothesis could at the utmost only explain the first suggestion, for the hints of the ancient texts point in a different direction. Already in *R.-V.* x. 129 there is a contrast between the sphere of death's power and the region of the deathless. Observation of the physical world suggested cycles of origin and decay; the dawn was re-born daily, and this rebirth (*punarbhava*) was the mythological statement of the maxim that whatever has a beginning in time must also have an end. Connection with material form (however refined) thus involved production and dissolution, where re-death (*punarmrityu*) corresponded to rebirth. But what regulated these processes for any given individual? There are indications that this problem was at first withheld from open discussion, and was treated as a secret mystery. The answer was finally reached along the line of the continuity of the product of a man's life. This was the doctrine of the 'deed' (*karman*). Every deed was regarded as producing something; it had a value, and this value remained even when the physical form of the agent and the external content of the action disappeared. The value might be only

ritual or ceremonial, but it might also be moral. Accordingly it was laid down that 'the deed does not perish' (*karma na kshīyate*), and still more explicitly 'a man is born into the world that he has made' (*Ātapatha Br.*, VI. ii. 2, 27). This is applied first to the world of sacrifice, but it was soon extended to the whole world of conduct, including that of thought and feeling, so that death conveyed each person into a new environment of happiness or suffering suitable to his case. Moreover, as the product of any life contains elements of various value, each of these must in turn receive its appropriate requital, and different heavens and hells arose in imagination to supply the moral demand. As the individual passed from one to another, he was in fact laying up fresh *karma* all the while; and as long as he remained traversing this course of existences (*samsāra*, the vb. *samsarati*, to 'pass through' or 'traverse'), he was rigidly encompassed by its inflexible self-operating law, but he had his destiny in his own hands. Finally, this explanation was applied to the circumstances of the present. Wealth and poverty, the vicissitudes of accident or disease, peculiarities of outward lot or inward disposition, were all interpreted as the product of the past. The existing distribution of comfort or pain, the qualities of character for good or evil, were all the direct result of previous action. The entire universe, therefore, from the topmost heaven to the lowest hell, was under the sovereignty of this principle. In due time the world of space and time would come to an end. But the potencies of *karma* were indestructible, and after an interval a new age (*kalpa*) would begin with a fresh order generated to give them their necessary field. Thus the whole problem of suffering fell away. Each separate individual—god, man, animal, demon—always and exactly got what he deserved.

But over against the sphere of phenomenal existence which was in death's power, lay the realm of the deathless. How was this to be reached? Its attainment was, in fact, the great object of philosophy. The majority of men, indeed, did not seek it. But the evidence first of the Upanishads and next of the Buddhist texts shows that in the middle Ganges valley in the 7th and 6th centuries B.C. there was an immense amount of eager discussion concerning it, both within and without the ranks of the Brahmanical caste. The Brahman himself might retire after due performance of ceremonial duty up to middle

life, and tend the sacred fire in some forest retreat, or he might adopt the style of a wandering ascetic. Many lay teachers, likewise, followed the same quest. The Greek ambassador Megasthenes at the court of Chandragupta (315 B.C.) reported that these ascetics discussed the constitution, shape, and limits of the universe, the relation of the Deity to it, and the nature and immortality of the soul. That summary corresponds sufficiently well to the records of early philosophical inquiry in the Upanishads, and to the reports of the Buddha's colloquies with his contemporaries. But it misses one essential feature: the aim of the higher knowledge was to escape from the phenomenal succession of existences into the realm of the unborn and the un compounded which was beyond the reach of death. The solution which first established itself within the limits of Brahmanical orthodoxy (afterwards embodied in the *Vedānta*, see below) was founded on the two conceptions already named, the Ātman and the Brahman. The doctrine of the 'self' rests primarily on the older animism, but it is worked into a kind of physiology and psychology on the human side, and is then employed metaphysically on the cosmic side. Any given existence contains two sets of elements: (1) those belonging to his particular corporeal being, which cease at death, and (2) those belonging to his continuous existence in the cycle of transmigration. Among the latter the most important are the *Prāṇas* or vital powers, potencies rooted in a kind of spiritual body which operates through the corresponding members of the physical organism. In man these belong (1) to the conscious and (2) to the automatic or unconscious life. In the first group are five of knowledge (the senses) and five of action (speech, hands, &c.), all being under the control of *Manas* (= *mens*), a kind of 'common sensory,' which acts as a medium between the higher intelligence (*Buddhi*) and the corporeal frame. The place of the 'self' in this scheme is not clear. It is sometimes located in the cavity of the heart; it is in size like a grain of barley or rice, or it is as big as a thumb; its shape is that of a man; its aspect is that of a yellow robe, smoke-coloured wool, a flame, a white lotus, light without smoke, &c. Such was the 'self' to simple imagination (cf. T. W. Rhys Davids, *Journal of the Royal Asiatic Soc.*, 1899, 71). But it had another character when its particular limitations were dropped. Behind the world of

sense lay the world of thought, which was not divided into separate individuals, but was common to them all, and gave to the world of external phenomena its true unity. The universe could not be apprehended by a mere enumeration of its contents; that which constituted it as its Self could only be reached through thought. This was present, therefore, everywhere, alike without and within, in the cosmos and in the heart, incapable of multiplication or of partition. A true view of life requires us to merge our individuality in the universal Self. The distinction between subject and object then disappears. The Self transcends both the knower and the known. As it cannot be differenced from anything else, it is unconditioned, and its only marks are 'no, no'; if it is represented in symbols, it is infinite like space, but as it is without dimensions, it may equally well be called a point. This lay behind all successional existence, and the realization of union with it brought deliverance from the *samsāra*. In another aspect, however, the world had been already identified as a manifestation of Brahman (masc. *Brahmā*, neut. *Brahma*). In the scene of visible things he constituted a sort of universal Prāna, including in one unity space, time, light, heat, sun, fire, the creative word, &c. But the world known to sense was only a veil of the reality within. Think all actual objects away; is Brahman thereby abolished? The answer was, 'Assuredly not': he is 'the true of the true,' he is *ekam advitīyam*, 'one without a second.' So the cosmic unity was identified with the unity which lies at the root of all self-consciousness, and the Brahman in the heart was the Self without passions or parts, the light of lights. If a quasi-reality was admitted in the world, during any given *kalpa*, the Brahman might be regarded as the great *Brahmā*, supreme, all-seeing, Maker, Disposer, Father of all beings, and a provisional theism was recognized. But if the unreality of individual existence was truly discerned, it followed that the world was unreal, too: it owed its aspect for sense to our ignorance, it was even the product of that ignorance (*avidyā*); and from this there was no deliverance save through the recognition of the illusory character of corporeality, and the perception of the fundamental identity of the Self with the ultimate Brahman. This was expressed in the formula *Tat tvam asi*, 'that art thou.' Then the world of ritual and Vedic study, even of ordinary moral relations, is left behind. Acts producing merit cease.

Freed from the bondage of desire, such a one 'stands blessed in the Brahman, who longs for a true man.'

The eagerness with which the speculations concerning the 'self' were pursued may be inferred from the conspectus of sixty-two wrong views about it according to the Buddha (*Dialogues*, trans. T. W. Rhys Davids, i. 27-52). Among these was the fourfold error of the 'Eternalists,' who maintained that the soul and the world were eternal, in which the germ of the *Sāṅkhya* system (see below) is probably to be detected. The antecedents of others of the six Darśanas may also belong to the great formative age in Indian philosophy from the 6th to the 3rd century B.C. But there is no record of their characteristic terminology, still less can they show any literary product like the Upanishads, some of which may be confidently ascribed to the pre-Buddhistic age (for a tentative chronological arrangement see Regnaud, *Matériaux*, i. 20). On the other hand, there were teachers daring enough to deny the first principle on which the Brahmanical philosophies were all based, viz. *karma*. Such, among the Buddha's contemporaries, was the agnostic Sanjaya, who repudiated all knowledge of the subject; the materialist Ajita of the hairy garment, who allowed no other life, rejected the claim to knowledge by higher insight, and resolved man into the four elements—earth, water, fire, air—which dispersed at death; the indifferentist Purana Kassapa, who acknowledged no moral distinctions, and consequently no merit or reward; and the determinist Makkhali of the Cow-pen, who indeed recognized the *samsāra*, but admitted no voluntary action, and hence no *karma*, each individual only working out the law of its nature which it could not modify or control, the sole cause of everything being found in *niyati*, destiny, impersonal necessity or fate (*Dialogues*, trans. Rhys Davids, i. 69-75).

Literature: general works on the religions of India: SAMUEL JOHNSON, *Oriental Religions*, India (1873); BARTH, *The Religions of India* (1882); HOPKINS, *The Religions of India* (1895). (1) Vedic Period: complete translations of the Rig-Veda, by GRASSMANN, 2 vols. (1876-7); by LUDWIG, 5 vols., with comm. (1876-83); and by GRIFFITH (Benares, 1889-92). Texts and translations in MUIR, *Sanskrit Texts*, v. (1872); selected hymns, trans. by MAX MÜLLER, *Hist. of Sanskrit Lit.* (2nd ed., 1860); cf. Hibbert Lectures (1878) and Six Systems (1899); SCHERMAN, *Philos.*

Hymnen a. d. Rig- und Atharva-Veda Samhitā (1887); cf. DEUSSEN, *Allg. Gesch. d. Philos.*, I. i. (1894). On the whole early period, HARDY, *Die vedisch-brahmanische Periode der Religion des alten Indiens* (1893). On the religion of the Rig-Veda, OLDENBERG, *Die Religion des Veda* (1894), and MACDONELL, *Vedic Mythology* (in Bühler's *Grundriss*, III, i, Heft A, 1897). (2) Early Brahmanism. Translations of the *Çatapatha Brāhmaṇa* by EGGELENG in *S. B. E.*, xii, xxvi, xli, xliii, xlv, and of the *Aitareya Brāhmaṇa* by HAUG; translations of eleven Upanishads by MAX MÜLLER, *S. B. E.*, i and xv; of twelve by RÖER, COWELL, and MITRA (edited by Tookaram Tatya, Bombay, 1891); and of sixty (Sechzig Upanishads des Veda) by DEUSSEN (1897). On the philosophy of the Upanishads, REGNAUD, *Matériaux pour servir à l'Histoire de la Philosophie de l'Inde* (i. 1876, and ii. 1878); GOUGH, *The Philosophy of the Upanishads* (1882); DEUSSEN, *Allg. Gesch. d. Philos.*, I. ii. (1899); cf. MAX MÜLLER, *Six Systems*, 159-83.

Jainism. Among the schools thus flourishing at the time of the foundation of Buddhism a word must be said about the Jains, who still exist as a religious community in India. They are the followers of the Jina, or Conqueror, known otherwise as Mahā-Vīra, the 'great hero,' whose career as teacher ended a little before that of his better known and younger contemporary, the Buddha. Like the Buddha he came to be regarded as the successor of others who had preceded him. Accepting the theory of transmigration under the law of *karma*, he taught a way of deliverance founded on perfect knowledge, faith, conduct, and austerities. In the metaphysical discussions mentioned above, the Jains avoided definite answers by the doctrine formulated as *syād-vāda*, 'it may be,' in opposition to Sanjaya's agnosticism (Jacobi). This method permitted the affirmation or denial of the same thing from different points of view, so that contrary qualities could be regarded as coexisting in one single object. The right knowledge was that taught by the Jina, and dealt first of all with six substances: *Dharma*, whose characteristic was motion, and *A-dharma*, whose characteristic was immobility (both co-extensive only with the world of visible objects), space, time, matter, and souls; these are the *astikāyas* or 'realities.' Souls (which belong to plants as well as to animate beings, and even to particles of earth, water, and fire) are eternal and self-subsistent; but they are

entangled (in a manner imperfectly explained) in the process of transmigration, owing to action and its consequent *karma*. Through the recognition of the influence of *karma* in determining the soul's destiny, the Jain doctrine is classed among the *kriyāvādas*, or systems which maintain that action has an effect on the soul. The quest of deliverance, therefore, took the form of cessation from action, and this in its turn led to extreme asceticism (one group, known as the 'air-clad,' discarded all clothing), and immense stress was consequently laid on self-control, the exercise of will, and the maintenance of a state of moral tension. In the details of Jain teaching, which was never very systematically organized, there are affinities with the modes of thought afterwards developed in the Sāṅkhya and Vaiśeṣika philosophies: but its speculations are still somewhat confused and incoherent. The Buddhist texts report various cases of discussion with eminent Jains, and occasional conversions (contrast *S. B. E.*, xvii. 108-115, with xxii. 65). For recent bibliography, see Jacobi in *S. B. E.*, vol. xiii, p. xv.

Buddhism. Most important of all the protests against the Brahmanical philosophy was the system of ethical culture founded by Gotama the Buddha, known in the West as Buddhism. This term, however, covers a great variety of beliefs, which may be roughly divided (for present purposes) into two great groups: (1) early Buddhism, presented in the Pāli canon of the 'Three Baskets' (*Ti-pitaka*), preserved in Ceylon, Burma, and Siam, characterized by complete rejection of all metaphysical conceptions, and (2) advanced Buddhism, as exhibited in the Sanskrit Scriptures of Nepal, and the colossal literatures founded upon them in China and Tibet, resulting from the assimilation of transcendental ideas with the primitive teaching. Historically, Buddhism takes its rise in the person of Gotama, son of a chieftain of the Sākya clan, who adopted the life of a wandering ascetic at the age of twenty-nine, devoted six years to the search for truth, was believed to have attained supreme enlightenment (to have become a Buddha) at thirty-five, spent forty-five years in teaching and superintending the Order or union of disciples instituted for the promotion of the doctrine and the cultivation of the higher life, and finally died at the age of eighty, his body being cremated, and the relics distributed among the clans of the adjoining districts (B.C. 477, Max Müller; 480, Oldenberg; born

about 600, Rhys Davids). How much of the theory of Buddhahood was elaborated in the Buddhist schools cannot here be discussed. The texts represent Gotama as one of a series (seven, or even twenty-four); and they further imply that an expectation was widespread in the middle Ganges valley that *Mahā-purisa* (Sansk. *puruṣa*), 'the great Man,' would appear, and would become either a universal monarch ruling in righteousness, or a blessed Buddha lifting off from the world the veils of ignorance and sin. This is the centre of the highly poetical mythology of Buddhism, and a point of departure for its subsequent metaphysical development.

The teaching of Gotama was necessarily closely related to the general ideas of his age. Like the Brahmanical philosophy, it assumed the process of transmigration and the doctrine of *karma*, and aimed at providing a way of deliverance from liability of rebirth. Like the higher Brahmanism, it recognized the gods of the popular religion within the limits of the same process, but it boldly stripped the great Brahṃa himself of his attribute of self-existence, and asserted that he, too, would cease to be. For Gotama repudiated all metaphysical conceptions, and again and again refused to enter on transcendental discussions (such as whether the world was infinite and eternal, or limited in space and time; see the 'Ten Indeterminates,' *Dialogues*, trans. Rhys Davids, i, 187, 254). He would deal only with the world as he knew it, a world which observation showed to be in a state of perpetual change, of growth, decay, and dissolution. All sentient existence (and with this alone he was concerned) was under this law. The first fact of conscious life, properly understood in all its bearings, is Suffering, for even birth and the joy and energy of youth lie in the shadow of old age and death. The Buddha further knows its Origin, the mode of its Cessation, and the Path which leads to that Cessation. These are the Four cardinal Truths, expounded with extraordinary variety of illustration and clearness of moral insight, and enforced by a personality of such nobility and attractiveness that it could become for uncounted millions a permanent object of devotion.

The Origin of suffering is found in the delusion of individuality, and is explained in an elaborate formula known as the 'Chain of Causation.' Briefly, the whole is summed up in the doctrine that there is no 'self' (*an-atta* [Pāli *attan* = Sansk. *ātman*]), and that the

appearance of separateness is due to error and ignorance, which beget the craving after the gratification of personal desire. The insistence on the polemic against the Brahmanical doctrine of the 'self' shows the immense importance which the Buddha attached to this central idea. It is the subject of his first discourse after attaining Buddhahood, in which his psychological theory is set forth. Any given individual is constituted by the union of a number of elements, bodily and mental, known as the *khandhas* or 'aggregates.' These fall into five groups (which are afterwards minutely subdivided, though the classifications appear to cross and recross), viz. (1) the attributes of bodily form, *rūpa*; (2) the sensations, *vedanā*; (3) the perceptions, *saññā*; (4) the conformations, *sankhāra*, distributed among thought, word, and deed; (5) consciousness, *viññāna*. With none of these can the self be identified; but as they are regarded as producing any specific being by their union, the conclusion is that there is no permanent self; at death the *khandhas* fall apart, and the individual is no more. As long, however, as he is involved in the process of transmigration, his *karma* remains, and, by a mystery known only to the Buddha, produces a new being in an appropriate environment. This new being is morally continuous with the preceding, though without memory of its previous existence. The insight of supreme wisdom, however (as in the case of Pythagoras), can detect the identity of character, and travel back through life after life.

The way of deliverance, therefore, must lie in the attainment of that condition in which the craving after individuality will be eradicated, and the roots of the accumulation of *karma* cut off. This is the realm in which there is no death, because there is no further rebirth; it is the realm of the unborn, the un compounded, which decay and dissolution cannot harm. Among other epithets for it is the term *nirvāna* (Pāli *nibbāna*), not found in the pre-Buddhistic Upanishads, and possibly, therefore, a new coinage. It denotes the 'going out' (like the flame of a lamp), and it is applied (as Prof. Rhys Davids first showed) to the dying down or 'going out' of the three fires of lust, ill-will, and delusion or dullness. This state of perfect holiness was only reached after long moral discipline, on which Gotama laid the whole stress of his teaching. This discipline was known as the 'Noble Eightfold Path'—the practice of Right

Views, Right Aspiration, Right Speech, Right Conduct, Right Livelihood, Right Effort, Right Mindfulness, Right Rapture or Meditation. Each of these terms is only a summary of manifold energies of thought, feeling, and will, in various combinations and applications. As the believer advances along the Path, he gradually breaks through the Ten Fetters which detain him in the bondage of transmigration, the 'delusion of being a self,' 'doubt,' 'belief in the efficacy of good works and ceremonies,' 'sensuality,' 'ill-will,' 'love of life in material existence,' 'love of life in immaterial existence,' 'pride,' 'self-righteousness,' and 'ignorance.' Complete emancipation is thus attained, and the Buddhist saint, or *arahat*, is reborn no more.

The theory of life thus sketched found its goal in the achievement of perfect holiness. That holiness was indeed conceived first of all as requisite for deliverance from transmigration. But it came to be regarded as an end in itself, and the true Buddhist loved goodness for its own sake. By degrees, however, the emphasis shifted. The *arahat* only saved himself, but the Buddha offered salvation to the world. Partly under the influence of the passionate missionary spirit which Gotama infused into his Order, the moral ideal changed. An imaginary biography of the Buddha's antecedent lives was constructed, and it became the duty of the disciple to emulate the Teacher by aspiring after the same function. A being in preparation for Buddhahood was known as a Bodhisattva. He did not attempt to cross the ocean of existence in a boat that would hold one only; he chose a larger vessel that would hold also men and devas. This was one source of the distinction between the early Buddhism of the 'Little Vehicle,' and the developed Buddhism of the 'Great Vehicle.' The literature of the latter school (which first begins to make its appearance in the second century B.C.) presents the Buddha as surrounded by vast multitudes of Bodhisattvas, numerous as 'the sands of nine Ganges.' This change is accompanied by another more significant still. One of the Brahmanical theories of the *Mahā-Purusha* (see above) identified him with the Absolute and the Eternal, and in the new system, accordingly, Buddhism has made terms with metaphysics, and transformed its founder from a man who could be born and die into the Self-Existent and the Everlasting. The phenomenal appearance of the Buddha is then explained as a semblance, after the manner of early

Christian Docetism, and the aim of the believer is to become a partaker of the Buddhature (cf. 2 Pet. i. 4).

This produced a great philosophical cleavage. The adherents of the 'Little Vehicle' were (in the main) realists of the ordinary type, affirming the existence of time, space, matter, &c., as we know them. Over against this was developed the theory of the Void. In early Buddhism this term was applied to the moral emptiness of the craving for wealth and other forms of enjoyment. But it was made the basis of a philosophical scepticism in which the phenomenal world and the whole inner series of sensations and ideas (the *skandhas*, &c.) were in turn declared unreal. Even the Buddha, the goal, and the path were all involved in this scholastic nihilism, and everything was doubted or denied except the doubt and the denial. This kind of advanced wisdom (*Prajñā pāramitā*) was developed in sūtras of enormous length, in which the moral enthusiasm characteristic of Buddhism is maintained with singular earnestness through vast wastes of arid discussion. It produced a reaction in the direction of idealism. The denial of outward differences led to the assertion of their unity in an abiding substance, which alone could render the successions of change intelligible; until, finally, the distinction between the conditioned mind and the ultimate ground of all thinking issued in the declaration that 'every phenomenon is the manifestation of mind' (*Surangama Samādhi Sūtra*, trans. into Chinese by Kumārajīva, A.D. 384-417; see Beal, *Catena*, 303, cf. *Sarva-Darśana-Samgraha*, by Mādhava Āchārya [*floruit* 1331], trans. Cowell and Gough).

Literature: an immense literature has gathered around Buddhism, of which only a small portion need be named here. For translations from the Pāli texts see S. B. E., x, xi, xiii, xvii, xx, xxxv, xxxvi, by MAX MÜLLER, FAUSEÖLL, OLDENBERG, and T. W. RHYS DAVIDS; Dialogues of the Buddha (from the *Dīgha Nikāya*), trans. Rhys Davids, i (1899); WARREN, Buddhism in Translations, Harvard Oriental Series, iii (1896); NEUMANN, Die Reden Gotamo Buddho's (from the *Majjhima Nikāya*), i (1896). Expositions of early Buddhism: RHYS DAVIDS, Buddhism, in S.P.C.K. Series 'Non-Christian Religious Systems'; Hibbert Lectures (1881); and American Lectures (1896); OLDENBERG, Buddha (1882, 3rd German ed., 1897); HARDY, Der Buddhismus (1890); COPLESTON, Buddhism Primitive and Present (1892).

Later texts: BURNOUF, *Lotus de la Bonne Loi* (1852); KERN, *Saddharma Pundarika*, in S. B. E., xxi (1884); abstracts in BURNOUF, *Introd. à l'Histoire du Bouddhisme Indien* (2^{me} éd., 1876); *Sanskrit Buddhist Literature of Nepal*, by Rajendra Lal Mitra (1882); and BEAL, *Catena of Buddhist Scriptures from the Chinese* (1871).

While the disciples of both the great schools of Buddhism lived and worked side by side (see Hiouen Tsang's account of the university of Nālanda), an immense diversity of opinion prevailed around them. A long catena of witnesses might be cited, such as the Buddhist poem of the *Lalitā Vistara*, the *Harsha Charita* of Bāna in the 7th century A.D., the treatise on India by the Mohammedan traveller Al-Bērūnī in the 11th century, or the conspectus of philosophical systems (*Sarva-Darṣana-Sangraha*) by Mādhava Āchārya in the 14th. The last-named work enumerates altogether sixteen schools, including (besides Buddhists and Jains) the Materialists who denied the existence of soul or God, and rejected the whole theory of *karma* and transmigration. These were known under various designations, and in the 14th century A.D. their ideas were fathered on a mythical ogre in the *Mahābhārata*, named Chārvāka (on the designation *lokāyata* see Rhys Davids, *Dialogues*, i. 166-72). Denying transmigration, they rejected the entire claims of the Brahmins. Matter was the only reality, and sense-perception the only form of knowledge. The pedigree of their textbook was traced back ironically (Macdonell) to Brihaspati, preceptor of the gods, and bitter verses survive, declaring 'There is no heaven, no final liberation, nor any soul in any other world.'

Out of this medley six schools finally acquired recognition as orthodox, or capable of some kind of reconciliation with the authority of the Veda. The modes of thought which they represent are doubtless of great antiquity (Max Müller supposes them to have been formed substantially between the 6th and 3rd centuries B.C.), but in the process through which they have descended to the present age they are embodied in certain *sūtras*, or collections of aphorisms, which sum up their principles in the briefest and most concentrated statements. These *sūtras* are ascribed to different authors, concerning whom, however, little or nothing is known; and the problems of their date and origin are often in the highest degree intricate and obscure. All the Six Systems—even those

originally atheistic (or at least non-theistic) in character—are founded on the doctrine of *karma*, and may be said to have the general object of showing a way out of a world which was regarded as full of suffering. In each there is a necessary contrast between ignorance and knowledge; and all lay stress at the outset on the *pramānas*, the sources and authorities of knowledge. The Materialists admitted but one—sensuous perception; elsewhere inference was added; and the number might be further increased by comparison, presumption, and trustworthy testimony, including revelation.

1 and 2. In the line of Vedic tradition stood the *Mīmāṃsā*, 'investigation' or 'inquiry.' The field of inquiry was the meaning of the sacred texts; and it fell into two parts, one prior (*pūrva*), and one posterior (*uttara*). These terms do not imply a time-order, though the subject-matter of the *Pūrva-Mīmāṃsā* must have originated at a very early period (Thibaut). The distinction refers on the one hand to the sphere of sacrificial action displayed in the *Brāhmanas*, and on the other to the sphere of the knowledge of Brahman exhibited in the 'forest-treatises' attached to the *Brāhmanas* and the *Upanishads*.

(1) The *sūtras* of the *Pūrva-Mīmāṃsā* are concerned with the knowledge of Dharma or religious duty, conceived chiefly from the ritual side. They are attributed to Jaimini, but there is no clue to his place or date. Their main philosophical interest centres (firstly) in the arguments for the uncreated character of the Veda and its existence from all eternity, involving the doctrine of the eternity of sound, and the further view that the connection of a word and its sense is not the result of a convention, but is eternal also, inhering in the word intrinsically, and (secondly) in the discussion of the rewards of duty. In the sequence of duty and reward, did the works produce their fruit directly, without superhuman interference, or were they requited directly or indirectly by the Lord (Max Müller)? The *Pūrva-Mīmāṃsā* taught the first view, and was thus exposed to the charge of atheism.

(2) By far the most important of all the schools (in continuity to the present day) is the other branch of the *Mīmāṃsā*, commonly known as the *Vedānta* (or 'Veda-end,' in the sense of the conclusion of the Veda in the *Upanishads*, or of the aim or highest object of the Veda). This is founded on the speculations of the earlier *Upanishads* con-

cerning the identity of the Self (*ātman*) and the Brahman. Its literary form is ascribed to Bādarāyana, of whom, however, nothing is known. The sūtras bearing his name (in 555 short paragraphs) appear to have been open to divergent interpretations, two of which have been preserved in commentaries of the highest rank, one bearing the name of Çankara, A.D. 788-820, the other of Rāmānuja, who flourished about A.D. 1127. (For a discussion of the question which most nearly represents the meaning of the sūtras on which they are based, see Thibaut's Introd. to his translation of the Vedānta Sūtras, *S. B. E.*, xxxiv.) The main problem of the Vedānta was to explain the relation of the soul and the world, as known in our common experience, to the supreme Brahman. In its highest form the Brahman is conceived by Çankara as absolutely homogeneous, pure intelligence or thought, eternal, infinite, indivisible. How then can we account for the appearance of the phenomenal world, with its successions of change, and its plurality of souls? This appearance is, in fact, due to an illusion (*māyā*), the result of our ignorance (*avidyā*). But this ignorance is something more than an individual disability. It is the product of ages, affecting all classes of beings, and has a general cosmic significance. Its origin remains obscure, but in virtue of its universal character *Māyā* may be regarded as the material cause of the world. This world is perpetually in process of being emitted, maintained, and reabsorbed, by the central energy of the Brahman, who, in this lower view, may be regarded as *Īçvara*, or God. Moreover, as 'dreams are true *while they last*' (Tennyson), Çankara allows that 'the entire complex of phenomenal existence is considered as true so long as the knowledge of the Brahman and the Self of all has not arisen, just as the phantoms of a dream are considered to be true until the sleeper wakes.' The highest knowledge discloses the real truth that there is no difference between the Self within and the supreme Self; the influence of *Māyā* is done away; the believer obtains final release from transmigration, and with death the illusion of individuality is at an end for ever. In this consummation the ethical life, which is an indispensable condition of the higher knowledge, disappears. This is the extremest form of the principle of *advaita*, non-duality or monism. Rāmānuja, who belonged to the Bhāgavatas, a sect of popular monotheism, also affirmed the existence of

Brahman as one all-embracing being. But he rejected the distinction between the higher and the lower knowledge, corresponding to the ultimate homogeneous being and the illusory form of *Īçvara* in the world of our experience. For him there was but one Brahman, comprising within himself elements of plurality which shared in his reality. The matter and souls of the universe, which we know, are a kind of body which Brahman everywhere pervades and rules. They are modes of his existence, effects of his energy, passing into different conditions as the world is evolved, sustained, and then again destroyed, but never entirely resolved back into Brahman. The performance of works will not lead the soul beyond the *samsāra*; by the way of knowledge, with the aid of grace, the disciple ascends to the realm of Brahman, and remains there in separate personal existence for ever. This form of *advaita* is known as *viçishṭa* or 'qualified'; the unity of Brahman is of such a nature that it manifests itself truly in the diversity of matter and spirit.

3. Over against the monism of the Vedānta stands the dualism of the *Sāṅkhya* ('connected with number,' perhaps originally a nickname of its adherents, 'those numerationists': so Garbe). Its sūtras bear the name of Kapila; but he, too, is an unknown personality; and the actual date of the texts in their existing form is not earlier than about A.D. 1380. Yet the elements of the system may be traced with much probability among the beliefs which early Buddhism denounced; while the oldest literary work of the school, the *Sāṅkhya-kārikā* of Īçvara-Krishna, having been translated into Chinese between A.D. 557 and 583, cannot be later than the 6th century. The main doctrine is the absolute distinction between matter and spirit. On the one hand is *Prakṛiti*, the primaevial stuff out of which the universe is produced in endless successions of evolution and destruction; on the other a boundless number of *Puruṣas*, or souls. Eight forms of *Prakṛiti* with sixteen modifications, together with *Puruṣa*, make up twenty-five *Tattvas* ('thatnesses' or principles), in the complete knowledge of which lies the way to final emancipation from rebirth. The union of soul and matter produces pain, for all conscious life is suffering (see the Four Truths, evidently modelled on the Buddhist summary, quoted by Garbe, *Die Sāṅkhya-Philosophie*, 195, from the *Sāṅkhya-pravachana-bhāṣya*, founded probably on very ancient tradition); and the object of

philosophy is the liberation of the Purusha. The original *Prakriti* is not regarded as homogeneous; it consists of three constituent principles (*gunas*) in equipoise, commonly designated goodness, passion, and darkness. A kind of unconscious impulse (derived from the *karma* accumulated in a previous world-system) in due time disturbs the balance, and leads to the production of a new universe. The undeveloped (*avyakta*) potential matter is first 'illuminated and intellectualized' by the development of a kind of cosmic *Buddhi* or intelligence. This in its turn generates *Aham-kāra* (literally 'I-making'), which involves the consciousness of subject and object, and so on through the elements of the subtle body with its internal organs which passes from life to life in the *sāmsara*, until finally the process ends in the coarser materials forming the world of our experience. Thus in any given individual the whole of the psychic life is regarded as the result of a material evolution, and is independent of the Purusha. The Purusha (whether infinitely little, or infinitely great) is pure spirit, absolute thought; but it is without attributes or qualities, it is unmoved by joy, pain, or other affections (which in any given individual are the products of its organization); it is solely engaged (while the *Prakriti* is undeveloped) in the 'knowledge of nothing' (Roer). By an obscure tendency to non-distinction (*aviveka*), the Purusha becomes united to a given set of psychic organs, with the result that it fills them with light, and the self-existent soul becomes an empiric *jīva* or personal life. It has thus the function of bringing the temporary condition of the inner organs into consciousness, but it has no will and cannot act, the entire volitional energies being derived from the material side of any particular existence. As all consciousness involves pain, the object of the truly wise is to liberate the Purusha from union with the material substrata which will then disappear, and enable it to return to its changeless independence. This is effected by the knowledge of 'distinction,' the eternal difference between spirit and matter (even in its most attenuated forms). For one thus emancipated, transmigration ceases, and at death the Purusha returns into that timeless unconsciousness of which dreamless sleep and swoon are the faint types on earth. The Sāṅkhya philosophy thus dispenses with any central unity; it needs no God (*Īṣvara*), and is consequently designated an atheistic doctrine (*nirīṣvara-vāda*).

4. Connected with this is the *Yoga* of Patanjali, who is often identified with the famous grammarian of that name (about 140-120 B. C.), though this is doubted by others. As the sūtras do not contain any polemical references to other systems, it is sometimes supposed that they were the earliest to take literary form. The Mahābhārata declares him wise who 'sees that the Sāṅkhya and the Yoga are one.' The Yoga theories of knowledge, cosmology, physiology and psychology, are essentially those of the Sāṅkhya, and the goal of final deliverance is conceived originally in the same manner (Garbe). The Yoga is in truth a system of practical disciplines for effecting the ultimate release of the Purusha from entangling bondage in matter. The term *yoga* itself ('yoking' or 'joining') has sometimes been interpreted as 'union,' viz. of the soul with God. But in the original sūtras on which the school is founded this is nowhere presented as the supreme end; and *yoga* is generally expounded by the best native and European scholars as 'effort,' 'exertion,' 'concentration.' It is in this sense that it is defined in the first aphorism as the 'suppression of the functions of the thinking-principle (*chitta*).' The Yoga (like the Sāṅkhya) assumes the existence of countless individual souls. In the evolution of the undeveloped *Prakriti*, the Sāṅkhya *buddhi* is represented by *chitta*, which, while intrinsically material and unconscious, becomes conscious through association with the Purusha. But, as in the Sāṅkhyan scheme, the Purusha is purely passive, and only serves as an illuminator of the processes carried on by the inner organs, which are themselves the products of a quasi-mechanical development. The purpose of the Yoga is the attainment of the knowledge which will break the bonds entangling the Purusha in the world of sense. It expounds the obstacles (such as causes of distraction, disease, languor, doubt, carelessness, &c.) which must be surmounted by concentration, cheerfulness, benevolence, compassion, and other modes of mental and moral energy. It lays stress on suitable practices of meditation, prescribes the regulation of the breath and appropriate postures (capable of being carried to terrible ascetic extremes), enumerates various occult powers which will be gained upon the way, and lays out seven stages marking the final realization of the liberating knowledge. In perfect emancipation (*kai-valya*) the Purusha is free alike from the works and sufferings of self-consciousness, and

abides eternally in undisturbed repose. On to this system was grafted a partial theism (derived perhaps from the Bhāgavatas), by which one Purusha was recognized as 'untouched by afflictions, works, deserts, and desires.' To this Purusha, which was not entangled in the cosmic process, the name *Īṣvara* was given (so that the Yoga became a *sa-Īṣvara* or *seṣvara-vāda*). By this means Patanjali's scheme escaped the reproach of atheism; but the divine Purusha was only differentiated from the rest by remaining apart, outside of time, while the remainder were involved in the successions of change. Devotion to him might aid the progress of the believer who 'made over all his actions to him'; but he had no part in the world of our experience, nor had the victorious disciple any necessary relation to him. Mitra, therefore, seems right in affirming that the theistic doctrine was in no way homogeneous or consistent with the Sāṅkhyan elements with which it was associated.

5 and 6. Two other systems appear in close alliance, the *Vaiṣeṣhika* or 'philosophy of discrimination,' and the *Nyāya* or system of reasoning or 'logic.' They possess much common matter, both in terminology and doctrine. They start from the same four sources of knowledge (*pramāṇas*), sensuous perception, inference, comparison, and 'word' in the sense of trustworthy testimony, including a guarded recognition of revelation in the Veda. They have a similar psychology and metaphysic, and they propose to the student the same goal in the liberation of the soul from the pain consequent on rebirth. They doubtless represent philosophical inquiries starting at an early date, and seem to be branches of a common endeavour to arrange all knowable things under certain heads, and lay down methods of acquiring knowledge. Of their reputed founders, Kanāda (or Kana-bhuj, 'atom-eater') and Gotama, nothing is known; their sūtras appear to have been studied by the Jains in the 6th century A.D., but they are probably of much greater antiquity (Garbe thinks the *Vaiṣeṣhika* the older). The aim of the *Vaiṣeṣhika* is deliverance from the suffering of transmigration, which is to be attained by perception of the real nature of the soul. This depends on a knowledge of the truth summed up in the six Categories. Such knowledge in its turn is to be acquired by *dharma* or 'duty,' conceived as forbearance from works in themselves evil, or from others undertaken with

a view to winning transitory fruits of happiness. The philosophical interest of the system lies in its attempt to include the objects of knowledge in six *Padārthas* ('word-things'), substance, quality, action, genus or community (what constitutes a genus), species or particularity (what constitutes an individual), and co-inherence or inseparability. To this some added 'not-being' or negation, and yet others, power or energy and resemblance. Under substance were enumerated the four elements—earth, water, light, and air—together with ether, time, space, soul, and *manas* (mind), the inner organ through which the soul acquired knowledge of the external world. The four elements were all constituted out of atoms, eternal and unalterable, in various combinations; and not only was the soul eternal, but (contrary to the Sāṅkhyan psychology) the *manas* also was regarded as an atom and eternal. Any given world-system was formed by the *adrishta*, the 'unseen,' the effects of *karma* in a previous world. *Īṣvara* is not named in Kanāda's sūtras, though some commentators find it implied in sūtra 3.

6. The *Nyāya* (lit. 'going back,' reference, and then logical argument, syllogism) likewise offers a scheme of saving knowledge. Final beatitude arises from proper comprehension of the truth, as summarized in the sixteen *Padārthas*. Only its lower form, however, is attainable in this life, where the fruits of past action may still affect the body, though they can no longer disturb the indifference of the soul. The higher, with its complete deliverance from the liability to pain consequent on rebirth, can be reached only through death. This is the usual opening in connection with the recognized orthodox theory. The real stress of the system lies in its analysis of the methods of thinking. This is effected in discussing the second *pramāṇa*, 'inference' (the four *pramāṇas* constitute the first and the seventh *padārtha*, 'premises'). Under the latter head the structure of the syllogism is expounded. This is arranged in five members (the terminology varies in the later *Vaiṣeṣhika* schools), including (1) The Proposition or Assertion, 'this hill is fiery'; (2) The Reason, 'for it smokes'; (3) The Instance (of the general rule), 'what smokes is fiery, as a kitchen hearth'; (4) The Application, 'accordingly, the hill is smoking'; (5) The Conclusion, 'therefore it is fiery.' The 'general rule' or 'universal proposition' is to be tested by affirmative and negative induc-

tion, which may be based on similar instances, or dissimilar, as in the following arguments against the Mīmāṃsa doctrine of the eternity of sound: '(1) Sound is non-eternal; (2) Because it is produced; (3) Whatever is produced is non-eternal, as pots, &c.; (4) Sound is thus produced; (5) Therefore it is non-eternal: or (1) Sound is non-eternal; (2) Because it is produced; (3) Whatever is unproduced is eternal, as soul, &c.; (4) But sound is not thus unproduced; (5) Therefore it is non-eternal' (quoted by Cowell in Colebrooke's *Essays*, i. 315). Other topics are also discussed, such as the *reductio ad absurdum*, and various forms of fallacy and wrong argumentation. Some of these are included among the sixteen *padārthas*, which are not arranged (as in the *Vaiśeṣika*) to include all objects of knowledge. These are expounded under the sub-heading *prameya* (what is measurable, and so ascertainable or demonstrable), constituting the second *padārtha* (the four *pramāṇas* being the first). Here are ranged the Self or Soul, body, the senses, understanding (*buddhi*), mind (*manas*), the inner organ which transforms sensations into perceptions, will, and all that concerns transmigration, up to final beatitude. The soul is infinite and eternal, and among their boundless plurality the later Nyāya exalted a Supreme Soul (*Paramātman*) as the seat of eternal knowledge, who created and maintained the universe ('the earth must have had a maker, because it is an effect like a jar'; 'the world depends upon some being who wills to hinder it from falling': see the *Kusumāñjali* of Udayanācārya, about 1200 A. D., tr. Cowell, 1864).

Various forms of eclecticism are represented by the *Svetāśvatara Upanishad*, the famous *Bhagavad-Gītā*, and other works (see the *Sarva-Darśana-Saṅgraha*) connected with the cults of Vishnu and Śiva. But these did not acquire permanent recognition. At the present day various influences have produced a revival of Vedāntism, which is being actively promoted by Swāmi Vivekānanda and others, and is represented by a monthly organ entitled the *Brahmavādīn*.

Literature: Texts of the Six Systems with translations printed for the use of the Benares College by Ballantyne (1850-53); FITZ-EDWARD HALL, Contrib. towards an Index to the Bibliog. of the Indian Philos. Syst. (Calcutta, 1851); *Sarva-Darśana-Saṅgraha* of Mādhava Ācārya (trans. COWELL and GOUGH, 2nd ed., 1894); COLEBROOKE'S *Essays* (ed.

Cowell), I. vii-xi; MONIER-WILLIAMS, *Indian Wisdom*, iii-vii; GARBE, *Philos. of Ancient India* (1897); MAX MÜLLER, *Six Syst. of Indian Philos.* (1899); MACDONELL, *Sansk. Lit.*, xv (1900), the last-named containing a list of the latest works of Germany and India, p. 451.

V. **China.** The state-religion of China is founded on traditions of high antiquity, embodied in the five classical books: (1) The *Yi King*, or 'book of Changes' or 'Transformations'; (2) The *Shu King*, a collection of quasi-historical memorials down to the reign of Hsiang (651-619 B. C.); (3) The *Shih King*, a collection of upwards of 300 odes, down to the reign of Ting, 606-586 B. C., which Confucius is supposed to have rearranged; (4) The *Chun Tsew*, a chronicle of the kingdom of Lu, 721-480 B. C., ascribed to Confucius; (5) The *Li Ki*, or 'book of Rites,' dating in its present form only from about the commencement of our era, but containing much older materials. The religion here delineated is a kind of ethicized animism, regulated by the two chief conceptions Heaven and Earth. Besides the spirits of the dead, vast numbers of spirits are grouped under the two great living powers which sum up the world. To the lower belong the spirits of the regions, lakes, rivers, mountains, grains, &c.; while in the upper realm are the spirits of the winds, clouds, rain, thunder, and the like. Some traces exist of a view of heaven and earth as the father and mother of all things; and in the *Yi King* many scholars have found the symbols of cosmogonic speculations concerning the production of all things from the male (heaven) and female (earth) principles Yang and Yin (also identified with the 'bright' and the 'dark'), but this is rejected by Legge (*S. B. E.*, xvi. 43), who points out that these terms occur in an appendix, and further ascribes to them another interpretation. At the head of all is the animated sky, Tien (or Chien), the actual expanse of heaven conceived as living (cf. the significant answer to modern objections reported by Edkins, *Religion in China*, 1884, 95). Vastness and unity are its attributes, its written character being compounded of the symbols for 'great' and 'one.' Heaven and Earth, as the parents of all creatures, act in harmony, with a steadfast energy. This 'order' is their decree or rule, and it is especially seen in the procedure of the sun and moon, the vicissitudes of the seasons, and (more generally) the regular course of nature. Power and action

lie with Tien, which maintains harmony in the universe, and founds upon it the moral order of society. The 'sincerity' of Tien is the basis of all right action; it is without respect of persons, and its impartiality supplies the type of all just rule. The moral attributes of Tien seem occasionally to transcend the conception of the living sky, which is personalized under the title *Shang Ti*, 'supreme ruler.' Applied in the state to the emperor, this name becomes, in relation to the universe, equivalent to God. His relation to Tien is not defined in the texts—the Odes use now one term, now another—but the *Li Ki* describes Shang Ti as 'dwelling in the great heaven'; and a whole series of commentators and philosophers afterwards asserted over and over again that Ti is present in the sky (or in the world) as the mind is in the body: 'Heaven and Earth are one material creation, just as the various bones make up the body of a man. Shang Ti is the lord and governor of heaven, and it is not possible that there should be two lords and governors' (cf. Legge, *Notions of the Chinese concerning God*, Hong Kong, 1852).

This conception of the order of nature as the root of personal and social morality is prominent in the teaching of two of the most famous Chinese sages, Confucius, and his elder contemporary Lao Tszé. Confucius (as the early Jesuit missionaries Latinized his native name) was born in 551 B.C., in the modern province of Shan-tung. Zealous as a student, he acquired administrative experience as keeper of grain-stores and superintendent of public lands, and also began teaching about 530. The empire was in a state of political confusion, owing to the weakness of the central power and its inability to control the dependent principalities, and Confucius suffered from the jealousy of ministers of other states. For a considerable period (515-501) he devoted himself to literary work and to teaching, but he accepted office in his native state of Lu in 500, and finally became minister of crime. Brigandage was suppressed, the fortresses of the great families dismantled, and morals generally reformed. After a short time, however, the prince of an adjoining state succeeded in alienating the confidence of the prince of Lu from his minister, and Confucius went forth as an exile, wandering for thirteen years (496-483), accompanied by a little band of disciples, often in want and danger, but sustained by the conviction that 'Heaven

would not let the cause of truth perish.' His last years were saddened by the deaths of his wife, his only son, and two of his favourite disciples: he himself died in 478 B.C. Confucius accepted the general principles of doctrine and ritual set forth in the *Kings*; but he used the title Shang Ti only with reserve, and tended to revert to the conception of Heaven as the source of power and symbol of order rather than as a personal being. He dwelt on the ceaselessness and simplicity of the productive energies of Heaven and Earth, and on their freedom from any private interests. He interpreted their silent order as a real revelation of Heaven, and affirmed that Heaven's decrees (*ming*) were to be gathered out of the events of life. The stress of the Confucian teaching fell on a kind of ethical naturalism, based on the principle of order displayed in the regularity of the world, and reflected in the constitution of man and the proper harmony of society. (1) Personally, man is born for uprightness; his nature is a gift from Heaven, every faculty and relationship having its proper law annexed; virtue consists in being true to this nature. Thus, the aim of the mind is truth, and of the character righteousness; virtue, therefore, needs no sanctions to enforce it, but is to be pursued for its own sake. Practically, however, human nature varies in its knowledge of duty, and its ability to fulfil it. Careful self-culture is therefore needed; special stress being laid on the control of thought and rectification of the heart. This alone secures full development of the individual nature (based on knowledge and virtue), which is thus enabled to provide for the proper development of other natures (animals, &c.), until the perfect man steps in to assist the transforming and nourishing powers of Heaven and Earth, and forms a 'ternion' with them. Thus man is brought into union with the forces outside him, which he learns to apply in accordance with their laws; and when the forces within him act in harmony, perfect order prevails (see the *Chung Yung*). (2) Man is further related to other men, and in the social state (whether tribe or empire) the true unit is the family. Here he enters into five relations (sovereign and minister, husband and wife, father and son, &c.), the duties of which must be performed with the three virtues of knowledge, magnanimity, and energy. The requirements of duty in these relations are made known by the principles of the 'not-I,' 'reciprocity,' and the 'measuring

square' (*Analects*, V. xi, XV. xxiii; *Ta Hio*, x; *Chung Yung*, xiii), 'what you do not want done to yourself, do not to others.' This rule is stated by Confucius in a negative form, but many of his precepts show that its positive significance was also familiar to him. The political philosophy of Confucius did not get beyond the conception of the state as a vast family. The sixth of the nine standard rules prescribed for the emperor required him to deal with the mass of the people as a father with children. The administrative hierarchy must imitate his example; and then the people themselves would follow it. Filial piety has ever since remained a prominent feature in the Chinese ideal; and when Buddhism established its monasteries in the midst of the followers of Confucius, it was again and again bitterly denounced for the disturbance which it introduced into family relations.

The practical ethics of Confucius did not pass unchallenged into the position of eminence which his teaching subsequently acquired. His doctrine was assailed from opposite sides by Yang Chu and Mih Teih (or Mi Tsze). The first-named paraded pleasure as the only good, conceived in the coarsest forms of sensual gratification. He contrasted the careers of the typical sages and the typical villains of antiquity; the laborious years passed by the former were in no way compensated by a posthumous fame which they could not feel; while the evil repute of folly or tyranny did no harm to the latter, who had enjoyed themselves recklessly at the expense of others. The satisfaction of desire, therefore, was the sole end of life, and in the disorders of contemporary society the strong who preyed upon the weak were justified. To Mih Teih this conclusion was unendurable. Why did thieves steal, and great officers throw each other's families into confusion, and one state make war upon another? There was one cause for all—the want of mutual love. If fathers and sons, rulers and ministers, were kind and filial, distress and confusion would disappear. Reciprocal affection is the guarantee of order, while the root of trouble lies in aversion and mistrust. The remedy for social ills therefore was obvious: 'it is needful,' said Mih Teih, 'to awaken in the heart the love of men.' From these two antagonistic principles, known as 'each for himself,' and 'loving all equally,' or 'universal love,' ethical speculation was recalled by Meng Tsze ('the philosopher Meng,' whose name was latinized as

Mencius), 372–289 B. C., into the more sober ways of Confucian morality. Mencius affirmed, like his predecessor, that the tendencies of man's nature are towards righteousness; but he distinguished a number of various impulses to action which were not all of equal rank, some being stamped with the nobility of heaven, and others rooted in the 'passion-nature' which pervades the physical organism. This 'passion-nature' it was the business of the will to subdue, so as to secure a due control. The general resemblance between the moral philosophy of Mencius and that of Butler has been pointed out by Legge; the Chinese sage, however, devoted more attention to elementary politics and the conditions of social well-being, asserting that 'the people are the most important element in the country; . . . and the ruler is the lightest.' From the time of Mencius the influence of the Confucian teaching steadily grew. The attempt of She Hwang-ti in 213 B. C. to destroy the ancient literary records was baffled by the devotion of the *literati*; and, under the Han dynasty which followed, the study of the text was pursued with extraordinary assiduity. On the introduction of the system of competitive examination, in A. D. 631, the nine Confucian classics were made the sole subjects of the new test for the public service, and they remain so to this day.

Beside the ancient state-religion of China stands the cult which European scholars designate Taoism. In its modern form, degraded by alliance with divination and magic, it has little connection with the profound conception from which it takes its name. The *Tao* was the watchword of an elder contemporary of Confucius, Lao Tsze ('the old philosopher'), whose birth is commonly placed about 604 B. C. The records of him are of the scantiest, and the authenticity of the little book of aphorisms known as the *Tao Teh King*, still defended by Legge, must be regarded as doubtful (Giles), though it contains many genuine sayings; but enough traces survive in Chinese literature, and especially in the writings of his disciple Chwang Tsze (contemporary with Mencius, about 300 B. C.), to indicate the presence of a powerful mind, whose thoughts have rather the character of philosophical intuitions than of reasoned and methodical system. The term round which his doctrine gathers, the *Tao*, was not new in Chinese usage. Its common meaning was 'way,' path, road, or course. The 'great Tao' was the high-road, contrasted with side lanes.

It was applied figuratively in the older literature to the course of nature, and also to the path of right conduct. The Tao of heaven denoted the sum of the actions and energies of the all-embracing sky; the Tao of the earth expressed the totality of the potencies and operations of the ground. Heaven and earth, however, could be named and described; the objects they contain could be classified; they could not—in their visible order—be the ultimate reality. Therefore the Tao that can be trodden is not the enduring and unchanging Tao; the originator of heaven and earth is beyond our apprehension, and consequently 'nameless'; but it works silently, fulfilling its own law, everywhere uniform and constant, producing, nourishing, maturing everything. It cannot be called conscious or unconscious, for it includes both; nor personal or impersonal, for it transcends both; in it are contraries reconciled, and the beam and the pillar (the horizontal and the perpendicular) are identical. The Tao is thus a kind of *natura naturans*; but with the practical aim which was never far distant from a Chinese thinker the Tao becomes at once a moral type. Heaven and earth do not interfere with the things they have begotten; they give each object opportunity to fulfil itself, and remain silent, acting yet not seeming to act. Man also must follow the Tao. In nature is unity, harmony, repose; the wise man must have no personal ends, he must avoid self-display, and cultivate humility. In the hands of Chwang Tsze this principle approaches very closely to a philosophy of the unconscious, as in the parable of the sword-maker who, by constant practice, came to be able to do the work without any thought of what he was doing, or in the question of Lao Tsze to a would-be disciple, 'Can you become as a little child?' In one of the imaginary colloquies in which Chwang Tsze expounds his master's teaching, Confucius is represented as summing up the Classics in two words, 'Benevolence and righteousness.' 'What do you mean by them?' asks the elder sage. 'To be in one's inmost heart in kindly sympathy with all things; to love all men; and to allow no selfish thoughts.' But Lao Tsze objects, 'To be seeking to allow no selfish thoughts—that is selfishness' ('your elimination of self is a positive manifestation of self,' Giles), and he points to heaven and earth, which unflinchingly pursue their course of impartial good will. Finally, government must be conducted, according to the Tao,

without boastful display. A great burst of reforming zeal, fresh enactments, increased command of material resources, the spread of luxury, the burdensome taxation which followed on the ruler's extravagance, were all alike contrary to the Tao. The ideal was to be found in a little state, which could be governed by the 'quiet and unexciting method of non-action'; but this involved keeping the people without knowledge or desire, for it is 'garrulity of speech which puts the world in disorder.' When, however, an emperor inquired, 'If the empire is not to be governed, how are men's hearts to be kept in order?' Lao Tsze bade him 'be careful not to interfere with the natural goodness of the heart of man.' 'The empire is a divine trust, and may not be ruled. He who rules, ruins. He who holds by force, loses.' 'Mighty is he who conquers himself.' 'To the good I would be good, to the not-good I would also be good in order to make them good.' 'Use the light that is in you to revert to your natural clearness of sight.' The best government, therefore, rests on a philosophical quietism, conserves existing institutions, and administers them on the principle of non-interference.

The attempts of different scholars to connect Lao Tsze's ontological speculations with Indian thought (e.g. Douglas, 1880, in contradiction to his former opinion, 1879; de Harlez, 1891) do not seem successful. But the introduction of Buddhism in the first century A.D. opened the way for an infusion of Hindu metaphysics (see *ante*, p. 233). Enormous labour was bestowed on the translation of Sanskrit works; and this in due time produced a revival of ancient cosmogonic and other speculations based on the texts. Thus in the 11th century Chow Tsze (1017-73) wrote a treatise on the 'Diagram of the Great Origin,' a secret doctrine supposed to be implied in the *Yi King*; and a hundred years after Chu Hi (1130-1200), who had devoted himself to the study of Buddhism and Taoism, reverted to the classical texts under the influence of his predecessor, and expounded a monistic philosophy on the basis of the 'Great Origin.' Of these works Mayer says, 'His commentaries on the classical writings have formed for centuries the recognized standard of orthodoxy, but within the last hundred and fifty years critics have arisen who have vigorously impugned the doctrines of his school.'

Literature: Texts and translations in LEGGE's Chinese Classics, 5 vols. in 8 parts

(1861-93); translations in S. B. E., iii, xvi, xxvii, xxviii. On the religions of China: PLATH, *Religion und Cultus der alten Chinesen* (Munich, 1862); JOHNSON, *Oriental Religions: China* (Boston, 1877); LEGGE, *Religions of China* (1880); RÉVILLE, *La Religion Chinoise* (1889); DE HARLEZ, *Les Religions de la Chine* (1891); BUCKLEY, in *Chantepie de la Saussaye's Religionsgeschichte* (2nd ed., 1897); (the three vols. of the *Religious System of China* by DE GROOT, 1892-7, deal only with the disposal of the dead). Special: Confucius, by PLATH (1867-74); FABER, *Lehrbegriff des Confucius* (1872), and *Quellen zu Confucius* (1873); GABELENTZ, *Confucius und seine Lehre* (1888); DOUGLAS, *Confucianism and Taoism* (1879 and 1889); other translations by PLÄNCKNER (1875, 1878); VICTOR VON STRAUSS (1880), &c. On Taoism: *Tao Te King*, le *Livre de la Voie et de la Vertu*, trans. JULIEN (Paris, 1842); also by PLÄNCKNER (1870) and by V. VON STRAUSS (1870); Taoist texts: trans. LEGGE in S. B. E., xxxix, xl; GILES, *Chwang Tzŭ* (1889); DE ROSNY, *Le Taoïsme* (1892); Mencius, see LEGGE's *Classics*, and *Mih Teze*, trans. DE HARLEZ in *Giornale della Società Asiatica Italiana*, viii (1894) and ix (1895-6). Cf. MAYER, *Chinese Reader's Manual* (1874); CARUS, *Chinese Philosophy* (Chicago, 1898).

On Philosophy in Japan cf. a paper by TETSUJIRO INOUYÉ, of Tokio, at the Congress of Orientalists (Paris, 1897), and published in the Japanese magazine *Hansei Zasshi*. A curious glimpse into the subjective idealism of the Buddhist sect founded by Nichiren (born in 1222 A.D.) is afforded by the essay of Abbot KOBAYASHI NITTO, *The Doctrines of Nichiren* (Tokyo, 1893): 'All phenomena, mental and material, in all times and spaces, are to be conceived of as existing subjectively in the consciousness of every individual, as his own physical and mental states, and thus only' (p. 8). (J.E.C.)

Orientation (bodily) [Lat. *orientare*, to set up with regard to the cardinal points, especially the east]: Ger. *Orientierung*; Fr. *orientation*; Ital. *orientazione*. (1) The maintenance of the normal position and spacial relationships of the body, as a whole, with reference to its surroundings. A better term for this meaning is *equilibrium*.

(2) The undisturbed consciousness of the spacial relationships of the body, as a whole, to its surroundings. (J.M.B.)

The orientation of the organism in space is conditioned psychologically by a number of

sense and reflex factors, by sensations of vision, by sensations from skin, joints, muscles of limbs and trunk, muscles of eyes, by the visual and tactual reflexes, and by the sensory and reflex mechanism of the **STATIC SENSE** (q.v.). (E.B.T.)

While accomplished by a fused mass of these sensations orientation becomes largely reflex, and only intrudes itself into consciousness when disturbed, as when one is very sleepy or under the influence of drugs. The balancing of the head, for example, is quite subconscious; yet when we nod, we discover certain elements of sensation, e.g. from the muscles co-ordinated with those of vision by which the normal head position is maintained. This head-balancing is gradually acquired by the child, as is also the erect position of the whole body, through association, together with natural reflexes. The influence of vision, normal and under artificial conditions, has been investigated experimentally by Stratton (*Psychol. Rev.*, iv., 1897, 341, 463). (J.M.B.)

Orientation (mental). The normal ability to recognize one's surroundings and the personal and social relations of the environment.

In mental disorders this power is frequently lost; the patient no longer recognizes or realizes his condition, his whereabouts, or his departure from his usual life. This condition is marked in insanities accompanied by hallucinations and systematic delusions. It is also characteristic of delirium, and of various forms of intoxication. (J.J.)

Orientation (illusions of): Ger. *Orientierungstäuschung*; Fr. *renversement de l'orientation* (Binet); Ital. *illusione dell' orientazione*. Disturbance of the normal consciousness of direction, especially as involving the shifting of the points of the compass in a way which shifts the entire physical environment with reference to the observer, but does not disturb the spacial relationships of objects to one another.

The term illusions of orientation was suggested by the translator of Binet's standard paper on the subject (*Psychol. Rev.*, i). Such shifting of the physical world is usually either 180° or 90° exactly; rarely between them or under 90°. Information does not usually dispel the illusion, which persists as a consistent scheme of directions, even after the true scheme is reinstated. For details, cases, and literature, see the paper by Binet, cited above. (J.M.B.)

Orientation (law of constant) [Ger. *Gesetz (or Prinzip) der constanten Orientierung*; Fr. *loi d'orientation constante*; Ital. *legge di orien-*

tazione costante. This law declares that the orientation of the eye is constant for every recurrent position of the line of sight, no matter by what road the line (or the eye) has travelled. It was formulated by Donders in 1847: see **DONDERS' LAW**.

Literature: HELMHOLTZ, *Physiol. Optik* (2nd ed.), 619, 638; HERING, *Beitr. z. Physiol.*, 248; WUNDT, *Physiol. Psychol.* (4th ed.), ii. 119. (E.B.T.)

Origen, surnamed **Adamantios**. (185–254 A.D.) His early education was at the hands of his father, Leonides, and Clemens Alexandrinus. At his father's martyrdom, Origen opened a school. He was made master of the catechetical school of Alexandria by Bishop Demetrius. Studied philosophy (under Ammonius Saccas) and Hebrew (upon a visit to Rome). Called to Greece (228) to dispute a heresy, and was made a presbyter at Caesarea. This ordination Bishop Demetrius refused to recognize. Excommunicated, 231, he opened his school in Caesarea with still greater success than before. See **ALEXANDRIAN SCHOOL**, and **PATRISTIC PHILOSOPHY** (5).

Origen: see **GENESIS**.

Origin of Evil: see equivalents for **EVIL**, under that term. A phrase used in discussions of the genesis and nature of **EVIL** (q. v.) in its various meanings, especially ethical evil.

The term **THEODICY** (q. v.) has come into use to include this problem in a larger one, more especially when treated from a theistic and apologetic point of view. A preliminary problem is necessarily that of the definition and classification of evils, and much of the discussion is vitiated by lack of clearness on this point. See **EVIL**.

Literature: the Book of Job, and the literature pertaining to Job, of which a late discussion is by ROYCE, *Studies in Good and Evil*. A different metaphysical standpoint is represented by ORMOND, *Basal Concepts in Philosophy*. For more theological treatment see the general works cited under **THEOLOGY**. As a problem of the philosophy of **RELIGION** (q. v.), it is treated in most of the literature there cited. See also **THEODICY**, especially the work of **LEIBNITZ**. (J.M.B.)

Origin of Life: Ger. *Ursprung des Lebens*; Fr. *origine de la vie*; Ital. *origine della vita*. The source of the first living organism upon the earth.

The attempt to prove spontaneous generation having failed, other theories have been advanced. It was suggested by H. E. Richter (1865), and later by Helmholtz and Lord Kelvin,

that micro-organisms might reach the earth upon meteorites. There are no direct observations to support this suggestion, which does not explain the origin of life, but merely puts it one stage further off. (C.S.M.)

At the present time life is known only in organisms of complex structure and chemical constitution, and always accompanied by the presence of a substance called protoplasm, to the activities of which all vital phenomena are due. Since the crude theory of the spontaneous generation of such organisms has been disposed of, there remains only, as a scientific explanation, the theory of their gradual evolution from inorganic lifeless elements, at a time when the earth had cooled sufficiently to allow the necessary chemical combinations to take place. The determination of the series of increasingly complex bodies, which must have formed links in the long chain of development leading up to the formation of the proteids of which living protoplasm now consists, has been attempted by many observers, and not entirely without success. Amongst these may be especially mentioned Pflüger. Cf. **LIFE**, **LIVING MATTER**, **PROTOPLASM**, and **VITALISM**.

Literature: E. PFLÜGER, *Pflüger's Arch.* (1875); T. H. HUXLEY, *The Physical Basis of Life* (1868), and *Collected Essays*; M. VERWORN, *Gen. Physiol.* (1899). (E.S.G.)

Origin of Species: Ger. *Ursprung der Arten*; Fr. *origine des espèces*; Ital. *origine delle specie*. Theory of the rise of diversities in the forms of animal life of sufficient magnitude to constitute different **SPECIES** (q. v.).

The phrase has been classic since the appearance of Darwin's *Origin of Species by Means of Natural Selection*. The two great rival theories are **SPECIAL CREATION** and **EVOLUTION**; see those topics. The corresponding 'classics' of the special creation theory are the *Book of Genesis* and its poetical exposition in Milton's *Paradise Lost*. Also see **FACTORS OF EVOLUTION**, **DESCENT**, **HEREDITY**, **TELEOLOGY**, and **NATURAL SELECTION**. (J.M.B., E.B.P.)

Origin versus Nature: no concise foreign equivalents. A phrase used to indicate the question whether a complete account of the origin of a thing would also be a complete account of its nature.

The inquiry is often made under the terms 'origin versus reality,' or, in an expression a little more sharp in its epistemological meaning, 'origin versus validity.' 'Origin versus nature' seems to mark better the general distinction between the 'how' of the question—how a

thing arose or came to be what it is; and the 'what' of the question—what a thing is.

The problem is brought to the fore by the current view that the nature—'the what'—of a thing is given in, and only in, its behaviour, i. e. in the processes or changes through which it passes. The more we know of behaviour of a certain kind, then the more we know of reality, or of the reality, at least, which that kind of behaviour is. And it is evident that we may know more of behaviour in two ways. We may know more of behaviour because we take in more of it at once; this depends on the basis of knowledge we already have—the relative advance of science in description, explanation, &c., upon which our interpretation of the behaviour before us rests. In the behaviour of a bird which flits before him, a child sees only a bright object in motion; that is the 'thing' to him. But when the bird flits before a naturalist, he sees a thing whose behaviour exhausts about all that is known of the natural sciences.

When we come further, on this view, to approach a new thing, we endeavour, in order to know what it is, to find out what it is doing, or what it can do in any artificial circumstances which we may devise. Just so far as it does nothing, or so far as we are unable to get it to do anything, just so far we confess ignorance of what it is. We can neither summon to the understanding of it what we have found out about the behaviour of other things, nor can we make a new class of realities or things to put it in. All analysis is, therefore, just the finding out of the different centres of behaviour which a whole given outburst of reality includes.

Yet there is a second aspect of a thing's reality which is just as important. Behaviour means, in some way, change. A mere lump would remain a lump, and never become a thing, if, to adhere to our phenomenal way of speaking, it did not pass through a series of changes. A thing must have a career; and the length of its career is of immediate interest. We get to know the thing not only by the amount of its behaviour, secured by examining a cross-section, so to speak, but also by the increase in the number of these sections which we are able to secure. The successive stages of behaviour are necessary in order really to see what the behaviour is. This fact underlies the whole series of determinations which ordinarily characterize things, such as cause, change, growth, development, &c., and

which are denoted by the terms 'dynamic,' 'genetic,' &c.

The strict adherence to the definition of a thing in terms of behaviour, therefore, would seem to require that we should wait for the changes in any case to go through a part at least of their progress—for the career to be unrolled, that is, at least in part. Immediate description gives, so far as it is truly immediate, no science, no real thing with any richness of content; it gives merely the snap-object of the child. And if this is true of science, of every-day knowledge of things, which we live by, how much more of the complete knowledge of things desiderated by philosophy as an answer to the question, What? It would be an interesting task to show that each general aspect of the 'what' in nature has arisen upon just such an interpretation of the salient aspects presented in the career of individual things.

A second point in regard to the 'what,' therefore, is that any 'what' whatever is in large measure made up of judgments based upon experiences of the 'how.' The fundamental concepts of philosophy reflect these categories of origin, both in their application to individuals—to 'mere things'—and also in the interpretation which they have a right to claim; for they are our mental ways of dealing with what is 'mere' on one hand and of reaching the final reading of reality which philosophy makes its method. Of course the question may be asked: How far origin? That is, how far back in the career of the thing is it necessary to go to call the halting-place 'origin'? This we may well return to lower down; the point here is that origin is always a reading of part of the very career which is the content of the concept of the nature of the thing.

Coming now closer to particular instances of the 'what,' and selecting the most refractory case that there is in the world, let us ask these questions concerning the *mind*. This case may be taken because, in the first place, it is the urgently pressing case; and, second, because it is the case in which there seems to be, if anywhere, a gaping distinction between the 'what' and the 'how.' Modern evolution claims to discuss the 'how' only, not to concern itself with the 'what'; or, again, it claims to solve the 'what' entirely by its theory of the 'how.' To these claims, what shall we say in the case of mind?

From the point of view given above, it would seem that the nature of mind is its

behaviour generalized; and, further, that this generalization necessarily implicates more or less of the history of mind; that is, more or less of the career which discloses the 'how' of mind. But a striking fact comes up immediately, when we begin to consider mental, and with it biological, reality—the fact of growth, or, to put it on its widest footing, the fact of *organization*. The changes in the external world which constitute the career of a thing, and so show forth its claim to be considered a thing, fall under some very wide generalizations, such as those of chemistry, mechanics, &c.; and when the examination of the thing's behaviour has secured its description under these principles in a pretty exhaustive way, we say the thing is understood. But the things of life, and the series of so-called organic changes which unroll its career, are not yet so broadly statable. When we come to mind, again, we find, indeed, certain well made out generalizations of its behaviour. But here, as in the case of life, the men who know most have not a shadow of the complacency with which the physicist and the chemist categorize their material. It is for this reason, no doubt, in part, that the difference between the two cases gets its emphasis, and the antithesis between origin and nature seems so necessary in one case, while it is seldom raised in the other. For who ever heard a student of natural science say that the resolution of a chemical compound into its elements, thus demonstrating the components and the law of the origin of the 'thing' analysed, did not solve the question of its nature, so far as science can state a solution of that question?

But we cannot say that the whole difference is one of greater modesty on the part of the psychologists. The facts rather account for their modesty. And the prime fact is one formulated in more or less obscurity by many men, beginning with Aristotle: the fact, namely, that organization, considered as itself a category of reality, never reaches universal statement in experience. To confine the case at first to vital phenomena, we may say that to subsume a plant or animal under the category of organization is to make it at once to a degree an unknown quantity, an *X*: a form of reality which, by right of this very subsumption, predicts for itself a phase of behaviour as yet unaccomplished—gives a prophecy of further career, but gives no prophecy (apart from other information which we may have) of the nature of this further phase of

career, in kind. Every vital organization has part of its career yet to run. If it has no further career yet to run, it is no longer an organization: it is then dead. Its reality is then exhausted by the predication of the categories of chemistry, mechanics, &c.—the sciences which construe all careers *retrospectively*. A factor of the biological and mental categories alike is, on the contrary, just this element of what the present writer has elsewhere called the 'Prospective Reference' (*Ment. Devel. in the Child and the Race*, chaps. vii, xi).

It does not matter how the content in any particular filling up of the category may be construed after it takes on the form of accomplished fact—after, i.e., it becomes a matter of 'retrospection.' All constructions in terms of content mean the substitution of the retrospective categories for those of 'prospection'; that is, it is the construction of an organization after it is dead, or—what amounts to the same thing—by analogy with other organizations which have run down, or have died, in our experience. Suppose, for example, we take the construction of the category of accommodation, in each particular instance of it, in terms of the law of FUNCTIONAL SELECTION (q.v.), and so get a statement of how an organism actually acquires any one of the special adaptations of its mature personal life; what, then, have we done? It seems evident that we have simply resorted to the 'retrospective' reference; we have changed our category in the attempt to get a concrete filling for a particular event; we are interpreting it *as already having happened*. To adopt the view that the category of organization can be in every case filled up with matter in this way, does not in any sense destroy the prospective element in the category of organization; for the psychological subtlety still remains in mind in the doing of it, either that the event must still be awaited to determine the outcome, and that I am agreeing with myself and my scientific friends to wait for it, or that we are solving this case by others for which some one has waited. A good instance of our mental subtleties in such cases is seen in the way we use the category of POTENTIALITY (q.v.). The extreme case of the reduction of the categories of prospective reference to those of retrospection is evidently the formula for PROBABILITY (q.v.). That formula appears to be a category of retrospection, applied to material which does not admit of any narrower or more special retrospective formulation.

The inference from this is that our predicate 'reality' is not adequately expressed, in certain cases—cases of vital and psychological organization—in terms of the experienced behaviour of so-called real content. The very experience on the basis of which we are wont to predicate reality testifies to its own inadequacy. We seem to be shut up to the alternatives that either the notion of reality does not rest upon experiences of behaviour, or that the problematic judgments based upon those experiences of progressive organization which we know currently under the term development are as fundamental to these kinds of reality as are those more static judgments based on history or origin.

It may be well, in view of the importance of this conclusion, to see something more of its bearings in philosophy. The historical theories of design, or TELEOLOGY (q. v.) in nature, have involved this question. Those familiar with the details of the design arguments pro and con will not need to have brought to mind the confusion which has arisen from the mixing up of the 'prospective' and 'retrospective' points of view. Design, to the mind of many of the older theistic writers, was based upon relative unpredictability—or better, infinite improbability. Such an argument looks forward: it is reasoning in the category of organization, and under the prospective reference. The organization called mental must be appealed to. What, was asked, is the probability of the letters of the *Iliad* falling together so as to spell out the *Iliad*? Their opponents, on the other hand, have said: Why is not the *Iliad* combination as natural as any other?—one combination has to happen; what is to prevent this? If a child who cannot read should throw the letters, the *Iliad* combination would be no more strange to him than any other. These men are reasoning in the retrospective categories. They are interpreting facts. The fault of the latter position is that it fails to see in reality the element of organization which the whole series when looked at from the antecedent point of view of the production of the real *Iliad* requires. It is true that the *Iliad* is one of an infinite number of possible combinations; but it is also true that Homer did not try the other combinations before hitting upon the *Iliad*. What would really happen, further, if the child should throw the *Iliad* combination, would be that nature had produced a second time a combination once before produced without

other trials (in the mind of Homer, and through him in ours), and it is the correspondence of the two—apart from the meaning of the text of the *Iliad*, i. e. its original production—which would surprise us. But this added element of organization needed to bring nature into accord with thought, and which the postulate of design makes in reaching a designer—this is not needed for the mere historical or retrospective interpretation of the facts. In other words, if the opponents of design are right in holding to a complete reduction of organization to retrospective categories, they ought to be able to produce intelligible results by throwing a multiple of twenty-six dice each marked with a letter of the alphabet. They of course cannot; but that does not make it necessary to deny the absolute universality of the retrospective categories: for after the *Iliad* is produced it may be considered one of an infinite number of possible combinations, happening in accordance with the law of PROBABILITY (q. v., especially the criticism of 'inverse' probability).

The later arguments for design, therefore, which tend to identify it with future organization, and to see in it, so far as it differs from natural law, simply a harking forward to that career of things which is not yet unrolled, but will be in accordance with thought—yet which, when completely unrolled, will still be a part of the final statement of origins in terms of natural law—this general view has so much justification.

Further, it is clear that the two opposed views of adaptation in nature are both genetic views—instead of being, as is sometimes thought, one genetic (that view which interprets the adaptation after it has occurred) and the other analytic or intuitive (that view which seeks a beforehand construction of design). The former of these is usually accredited to the evolution theory; and properly so, seeing that the evolutionist constantly looks backward. But the other view, the design view, is equally genetic. For the category of organization by which it proceeds is also distinctly an outcome of the movement or drift of experience towards the realization of career. Teleology, then, when brought to its stronghold, is a genetic outcome, and owes what force it has to the very point of view that its most fervent advocates—especially its theological advocates—are in the habit of running down. The consideration of the stream of genetic history itself, no less than the attempt to explain the

progress of the world as a whole, its career, leads us to admit that the real need of thinking about the future in terms of organization is as great as the need of thinking about the past in terms of natural law. The need of mental organization or design is found in the inadequacy of natural law to explain the further career of the world—and its past career also, as soon as we go back to any place in the past and ask the same question there of the part which then becomes future. It would be possible, also, to take up this last remark for further thought, and to make out a case for the proposition that the categories of 'retrospective' thinking also involve a strain of organization—a proposition which is equivalent to one which the idealists are forcibly urging from other grounds and from another point of view. Lotze's argument to an organization at the bottom of natural causation has lost nothing of its power. Ormond (*Foundations of Knowledge*) has given us an argument for a social interpretation of physical interaction. It is hard to see the force of the assumption tacitly made by the positivists, and as tacitly admitted by their antagonists, that causation, viewed as a category of experience, is to be ultimately understood entirely under such retrospective constructions as 'conservation of energy,' &c. Such constructions involve an endless retrospective series. And that is to say that the problem of origin is finally insoluble. Well, so it may be. But yet one may ask, why this emphasis of the 'retrospective'—a category which has arisen with just the basis of experience that the 'prospective' also has? It may be a matter of taste; it may be a matter of 'original sin.' But if we go on to try to unite our categories of experience in some kind of a broader logical category, then the notion of the ultimate, it would seem, must require—and somehow combine—both of the aspects which our conception of reality includes; the 'prospective' no less than the 'retrospective.' Origins must take place continually as truly as must sufficient reasons. The only way to avoid this is to say that reality has neither forward nor backward reference. So say the idealists who find in 'thought' a *punctum stans* which is not in time. But in dealing with reality we are dealing with experience; and the opinion has some force that thought which looks neither backwards nor forwards—whatever further category it may have under which the antithesis may be transcended—is not thought at all.

Another subtlety might raise its head in the inquiry whether in their origin all the categories themselves did not have a 'natural history.' If so, it might be said, we are bound, in the very fact of thinking at all, to give exclusive recognition to the historical aspect of reality. But here is just the question: does the outcome of career to date give exhaustive statement of the idea of the career as a whole? There would seem to be two valid objections to it. First, it would be, even from the strictly objective point of view, the point of view of physical science, to construe the thing mind entirely in terms of the behaviour of its stages antecedent to the present: that is, entirely in terms of descriptive content, by use of the categories of retrospective interpretation. And, second, it does not follow that because a mental way of regarding the world, i.e. the way of prospection, is itself a genetic growth, therefore it is a misleading way, for the same might be urged against the categories of descriptive science, i.e. the retrospective, which have had the same origin.

There are one or two points among many suggested by the foregoing which it may be well to refer to. It will be remembered that in speaking of the categories of organization as having prospective reference, instances were adduced largely drawn from the phenomena of life and mind, contrasting them somewhat strongly with those of chemistry, physics, &c. The use afterwards made of these categories now warrants us in turning upon that distinction, in order to see whether our main results hold for the aspects of reality with which those sciences deal as well. It was intimated above in passing that the other categories of reality, such as causation and mechanism, are really capable of a similar evaluation as that given to teleology. This possibility may be put in a little stronger light.

It is evident, when we come to think of it, that all organization in the world must rest ultimately on the same basis; and the recognition of this is the strength of thoroughgoing naturalism and absolute idealism alike. The justification of the view is to be made out, it would appear, by detailed investigation of the genetic development of the categories. The way the child reaches his notion of causation, for example, or that of personality, is evidence of the way we are to consider the great corresponding race-categories of thought to have been reached; and the category of causation is, equally with that of personality

or that of design, a category of organization. The reason that causation is considered a cast-iron thing, implicit in nature in the form of 'conservation of energy,' &c., is that in the growth of the rubrics of thought certain great differentiations have been made in experience according to observed aspects of behaviour, and those events which exhibited the more definite, invariable aspects of behaviour have been put aside by themselves; not of course by a conscious convention of man's, but by the conventions of the organism working under the very method which we come—when we make it consciously conventional—to call this very category of organization. What is conservation but a kind of organization looked at retrospectively and conventionally? Does it not hold simply because my organism has made the convention that only that class of experiences which are 'objective' and regular and habitual to me shall be treated together, and shall be subject to such a regular mental construction on my part?

But the tendency to make all experience liable to this kind of causation is an attempt to undo nature's convention—to accept one of her results, which exists only in view of a certain differentiation of the aspects of reality, and apply this universally to the subversion of the very differentiation on the basis of which it has arisen. The fact that there is a class of experiences whose behaviour issues in such a purely historical statement and arouses in me such a purely habitual attitude, is itself witness to a larger organization—that of the richer consciousness of expectation, volition, and prophecy. Otherwise conservation could never have secured abstract statement in thought.

The reason that the category of causation has assumed its show of importance is just that which intuitionist thinkers urge; and a historical example of confusion due to their use of it may be used for illustration. Causation is about as universal a thing—in its application to certain aspects of reality—as could be desired. And we find men of this school using this fact to reach a certain statement of theism. But they then find a category of 'freedom' claiming the dignity of an intuition also; and although this comes directly in conflict with the uniformity ascribed to the other, nevertheless it also is used to support the same theistic conclusion. The two arguments read: (1) an intelligent God exists because the intelligence in the

world must have an adequate cause, and (2) an intelligent God exists because the consciousness of freedom is sufficient evidence of a self-active intelligence in the world, which is not caused. All we have to say, in order to avoid the confusion, is that any mental fact is an 'intuition' in reference only to its own content of experience. Intelligence viewed as a natural fact, i.e. retrospectively, has a cause; but freedom in its meaning in reality, i.e. with its prospective outlook, as prophetic of novelties, is not adequately construed in terms of history. So both can be held to be valid, but only by denying universality to each 'intuition' and confining each to its sphere and peculiar reference in the make-up of reality.

Another thing to be referred to in this rough discussion concerns the more precise definition of 'origin.' How much of a thing's career belongs to its origin? How far back must we go to come to origin?

Up to this point the word has been used with a meaning which is very wide. Without trying to find a division of a thing's behaviour which distinguishes the present of it from its history, we have rather distinguished the two attitudes of mind engendered by the contemplation of a thing, i.e. the 'retrospective' attitude and the 'prospective' attitude. When we come to ask for any real division between origin and present existence, we have to ask what a thing's present value is. In answer to that, we have to say that its present value resides very largely in what we expect it to do; and then it occurs to us that what we expect it to do is no more or less than what it has done. So our idea of what is, as we said above, gets its content from what has been. But that is to inquire into its history, or to ask for a fuller or less full statement of its origin or career. So the question before us seems to resolve itself into the task of finding somewhere in a thing's history a line which divides its career up to the present into two parts—one properly described as origin, and the other not. Now, on the view of the naturalist pure and simple, there can be no such line. For the attempt to construe a thing entirely in terms of history, entirely in the retrospective categories, would make it impossible for him to stop at any point and say, 'This far back is nature and further back is origin'; for at that point the question might be asked of him, 'What is the content of the career which describes the thing's origin?'—and he would have to reply in exactly the

same way that he did if we asked him the same question regarding the thing's nature at that point. He would have to say that the origin of the thing observed later was described by career up to that point; and is not that exactly the reply he would give if we asked him what the thing was which then was? So to get any reply to the question of the origin of one thing different from that to the question of nature at an earlier stage, he would have to go still further back. But this would only repeat his difficulty. So he would never be able to distinguish between origin and nature except as different terms for describing different sections of one continuous series of aspects of behaviour. This dilemma holds also, I think, in the case of the intuitionist. For as far as he denies the natural history view of origins and so escapes the development above, he holds to special creation by an intelligent Deity; but to get content to his thought of Deity he resorts to what he knows of mental behaviour. The nature of mind then supplies the thought of the origin of mind.

Of course, on the view developed, the question of the ultimate origin of the universe may still come up for answer. Can there be an ultimate stopping-place anywhere in the career of the thing-world as a whole? Does not our position make it necessary that at any such stopping-place there should be some kind of filling drawn from yet antecedent history to give our statement of the conditions of origin any distinguishing character? It seems so. To say the contrary would be to do in favour of the prospective categories what we have been denying the right of the naturalist to do in favour of those of retrospect. Neither can proceed without the other. The only way to treat the problem of ultimate origin is not to ask it, as an isolated problem, but to reach a category which intrinsically resolves the opposition between the two phases of reality. Lotze says that the problem of philosophy is to inquire what reality is, not how it is made; and this will do if we remember that we must exhaust the empirical 'how' to get a notion of the empirical 'what,' and that there still remains over the 'prospect' which the same author has hit off in his famous saying: 'Reality is richer than thought.' To desiderate a what which has no how—this seems as contradictory as to ask for a how in terms of what is not. It is really this last chase of the 'how' that Lotze deprecates—and rightly.

Of the great historical solutions, that of the intellectualists leans to the retrospective, that of the voluntarists to the prospective; a consistent affectivist theory has never been worked out, although something might be said for a form of what we may baptize beforehand as 'aesthonomic idealism'—aesthetic experience being made the metaphysical prius both of science and of value. This would be no doubt as profitable as the Hegelian logicism which reads reality out of the categories in order to transcend their oppositions.

The conclusions may be summed up in certain tentative propositions as follows:—

(1) All statements of the nature of 'things' get their matter mainly from the processes which they have been known to pass through: that is, statements of nature are for the most part statements of origin.

(2) Statements of origin, however, never exhaust the reality of a thing, since such statements cannot be true to the experiences which they state unless they construe the reality not only as a thing which has had a career, but also as one which is about to have a career; for the expectation of the future career rests upon and is produced by the same historical series as the belief in the past career. Cf. PRAGMATISM, *passim*.

(3) All attempts to rule out prospective organization or teleology—the belief in the correspondence between reality and thought—from the world would be fatal to natural science, which has arisen by a series of provisional retrospective interpretations of just this kind of organization: and fatal also to the historical interpretation of the world found in the evolution hypothesis; for the category of teleology thus understood is but the prospective reading of the same series which, when read retrospectively, we call evolution. Cf. the remarks on teleology and evolution under HEREDITY.

(4) The fact that mental products, ideas, intuitions, &c., have a natural history is no argument against their validity or worth as having application beyond the details of their own history; since, if so, then a natural history series can issue in nothing new. But that is to deny the existence of the idea or product itself, for it is a new thing in the series in which it arises.

(5) All these points may be held together in a view which gives each mental content a twofold function in the mental life. Each such content begets two attitudes in the progressive development of the individual. So

far as it fulfils earlier habits, it begets and confirms the historical or retrospective attitude; so far as it is not entirely exhausted in the channels of habit, it begets the expectant or prospective attitude.

(6) The final account of reality must invoke a category which in some way reconciles these two points of view.

Literature: RITCHIE, Darwin and Hegel, chap. i; ROYCE, Spirit of Mod. Philos., in loc.; and Int. J. of Ethics, July, 1895; BALDWIN, Int. J. of Ethics, Oct., 1895; The Origin of a Thing and its Nature, Psychol. Rev., ii, 1895, 551 ff. (a paper which this article in part repeats); URBAN, Psychol. Rev., iii, 1896, 73 ff. (J.M.B.)

Original: Ger. *ursprünglich*, *originell*; Fr. *original*; Ital. *originale*, *originario*. (1) Adjective of origin, meaning (a) primitive, (b) fundamental (original truth), (c) underived (original qualities, Locke). Cf. GENESIS.

(2) COPY (q. v., sense 1) or MODEL (q. v.).

(3) Applied also to that from which something originates: e.g. original thinker, original source, &c. (J.M.B.)

Original Quality: see ORIGINAL (1c), and QUALITY.

Original Sin: Ger. *Erbsünde*; Fr. *péché originel*; Ital. *peccato originale*. A natural tendency or disposition to evil in human nature which is ascribed to the fall of man and which tends inevitably to actual sin in the individual life. See SIN.

Original sin is related to total depravity as a concomitant effect of the fall of man. The great exponent of the doctrine among early thinkers is Augustine. It has been denied by Pelagians and Socinians. The dogma is one of the essential features of Calvinism.

Literature: JULIUS MÜLLER, Die christl. Lehre v. d. Sünde (6th ed., 1877; Eng. trans. of same, Edinburgh, 1877); JONATHAN EDWARDS, The Great Doctrine of Original Sin defended, ii (Worcester ed.). Works on THEOLOGY (q. v.). (A.T.O.)

Orphic Literature: Ger. *orphische Dichtungen*; Fr. *littérature orphique*, *les orphiques*; Ital. *letteratura orfica*. A collection of poems and hymns ascribed to Orpheus, the mystic founder of a religious sect or school which arose in Greece during the 6th century B. C., but which were actually composed at different periods by a number of representatives of the sect.

Of Orpheus, who is celebrated both as a divine player on the lyre and as the poet founder of a religion, there is no trustworthy evidence (so Aristotle thinks) that he was

a real personage. The doctrines of the sect are a compound of Bacchic mysteries and the philosophical tenets of the Pythagoreans. Except a few fragments which have been collected by Lobeck, and other verses found later and dating probably from the 3rd century B. C., the Orphic literature, which held a prominent place in the contests and religious mysteries of Greece, has been lost.

Literature: LOBECK, Aglaophamus (1829); ABEL, Orphica (Berlin, 1885); GRUPPE, Die griechischen Culte u. Mythen (Leipzig, 1887). (A.T.O.)

Orthodoxy (in theology) [Gr. *ὀρθός*, straight, + *δόξα*, opinion]: Ger. *Orthodoxie*; Fr. *orthodoxie*; Ital. *ortodossia*. Correctness of belief as determined by the authoritative symbols of an ecclesiastical organization, in the light of some accepted interpretation.

The notion of orthodoxy presupposes some ultimate court of appeal. On this there is no general agreement among Christians. Roman Catholics find the ultimate test of orthodoxy in the deliverance of an infallible pope or an infallible church, while Protestants as a rule make the final appeal to Scripture. This, however, is not strictly final, as some interpretation of Scripture must be accepted as standard. Orthodoxy is a purely relative term, and always presupposes an attitude of conformity to an accepted standard of belief.

Literature: SHEDD, Orthodoxy and Heterodoxy (1893); NEWMAN SMYTH, The Orthodox Theol. (1883). (A.T.O.)

Orthogenesis [Gr. *ὀρθός*, straight, + *γένεσις*, origin]: Ger. *Orthogenesis*; Fr. *orthogénèse*, *évolution orientée*; Ital. *ortogenesi*. Evolution which is definitely directed or DETERMINATE (q. v.) by reason of the nature or principle of life itself. Cf. DESCENT (theory of), NATURAL SELECTION, and ORTHOPLASY.

That organic evolution follows certain predetermined lines quite irrespective of any 'selection' due to the action of the environment has been the belief of many naturalists. Eimer terms such definitely directed evolution, to which any selection which may occur is merely subsidiary, Orthogenesis. 'There is,' he says, 'no chance in the transmutation of forms. There is unconditioned conformity to law only. Definite evolution, orthogenesis, controls this transmutation. It can lead step by step from the simplest and most inconspicuous beginning to ever more perfect creations, gradually or by leaps; and the cause of this definite evolution is organic growth.' Eimer has discussed his views in

relation to the Lepidoptera at considerable length. Many biologists fail to find in his discussion any indication of the organic antecedents of particular lines of growth or transmutation. The conception would seem to be a form of vitalism, involving 'self-adaptation' of individual organisms, and the inheritance of acquired characters. See Eimer, 'Orthogenesis,' *Verh. d. Deutsch. Zool. Gesell.* (1895, Eng. trans., *On Orthogenesis*). Delage, however (*Structure du Protoplasma*, 46), attributes the term orthogenesis to Haake. (C.L.L.M.—J.M.B.)

Orthognathous (skull): see PROGNA-THISM.

Orthoplasia [Gr. *ὀρθός*, straight, + *πλάσις*, a fold]: Ger. *Orthoplasie*; Fr. *orthoplasie*; Ital. *ortoplasia*. Determinate or definitely directed evolution under the laws of NATURAL and ORGANIC SELECTION (see those terms).

Evolution by orthoplasia. L, L', line of evolution; 1, 2, &c., successive generations by physical heredity; T, T', line of tradition (social heredity); cm, cm', &c., congenital mean; a, a', &c., accommodations supplementing cm, &c.; v, v', &c., (congenital) variations in direction of a, &c. The species is kept alive by a, a', &c., and T, T', &c., during evolution of cm.

This term has been suggested and adopted by the advocates of the theory of organic or indirect selection as opposed to ORTHOGENESIS (q.v.), the latter having a vitalistic meaning, and implying Lamarckian heredity. Orthoplasia, on the contrary, emphasizes natural selection working upon variations in many cases screened and fostered by the presence of individual modifications. Cf. CONVERGENCE (in biology), ad fin.

This theory of evolution may be illustrated by the accompanying diagram, which should be compared with the similar ones given under NATURAL SELECTION and LAMARCKISM.

Literature: see ORGANIC (OR INDIRECT) SELECTION. (J.M.B., C.L.L.M.)

Orthos Logos [Gr. *ὀρθός λόγος*]. Right REASON (q.v.) in various senses in ancient

philosophy. Cf. Eisler, *Wörterb. d. philos. Begriffe*, sub verbo. (J.M.B.)

Other: see SAME AND OTHER, and ALTER.

Otology [Gr. *ὠτός*, *ōtós*, ear]: Ger. *Ohrenkunde*; Fr. *otologie*; Ital. *otologia*. The science of the ear, its anatomy, physiology, and pathology. See Ear under HEARING. (C.F.H.)

Oughtness (and **Ought**) [AS. *āhte*, from *āgan*, to owe]: Ger. *das Sollen*; Fr. *devoir* (duty), *ce qui doit être*; Ital. *dovere*, *ciò che deve essere*. 'Oughtness' is the COEFFICIENT (q.v.) of the ethical to which the moral nature responds. The 'ought' is distinguished from the 'is' as the ideal from the actual in the ethical sphere.

The term suggests the idea of debt, or something which we 'owe' to another, and the intuitionist school have argued that it implies the idea of One to whom we owe the conduct in question—namely, God. Kant deduced the freedom of man as a moral being from the moral consciousness of oughtness: 'Thou shalt' implies 'thou canst.' The ethical empiricists or 'realists' have always sought, particularly by investigating the 'sanctions' of virtue, to make the ideal in some way a function of the actual, the 'ought' a function of the 'is,' e.g. the Utilitarians and the Evolutionists. Cf. OBLIGATION (moral), and SANCTION (moral). (J.S.—J.M.B.)

Ousia [Gr.]: see GREEK TERMINOLOGY, Glossary, HOMOIOUSIA, and HOMOIOUSIA.

Outer and **Inner**: see EXPERIENCE, and cf. OUTNESS.

Outness [AS. *ūt*, out]: Ger. *Aussensein*; Fr. *externalité*; Ital. *esteriorità*. Distance; externality in space; externality to mind.

The term was introduced by Berkeley in his *Essay towards a new Theory of Vision* (46), also *Principles of Knowledge* (47). In each case it is used as synonymous with space and distance. Hume uses it also as equivalent to distance (*Treatise*, Bk. I. Pt. IV. § 2). So also Reid and Hutchinson Stirling. Huxley: 'sense of outness, power of distinguishing between the external world and himself' (*Physiology*, § 289). (J.D.)

Overindividual. Ger. *überindividuell*; Fr. and Ital. equivalents not in use. Any act or object of real personality is over-individual if it is acknowledged as belonging to every real personality in the fulfilment of its meanings. These meanings constitute, with regard to objects, the physical universe; and with regard to attitudes, they constitute ethical, logical, and aesthetic obligations. (H.M.)

This term as defined above is used by Münsterberg (*Psychol. and Life*), and translates the German *überindividuell*. (J.M.B.)

Overproduction (in biology): see EXCESS, and PRODIGALITY OF NATURE.

Overproduction (in economics): Ger. *Ueberproduktion*; Fr. *excès de l'offre* (or *de production*); Ital. *eccesso di produzione*. A continuance of supply at prices which are not remunerative to the producer.

When there are large investments of fixed capital, it may involve a worse loss to stop work than to go on at a disadvantage; and in these cases overproduction may continue for a long period.

It is argued by most writers that what is called overproduction is really disproportionate production. It is not that we have too much of some things, but too few of others to exchange for them. But an application of the theory of utility shows the error of this view. It is conceivable that products of a certain kind should be so multiplied that their utility would be less than their cost. For overproduction, be it observed, does not mean that more goods are produced than people can consume, but more than they are willing to pay for.

In practice, the cause of what is known as general overproduction is a scarcity of means of payment, due to a contraction of credit, or to a commercial crisis. (A.T.H.)

Oversoul: Ger. *Ueberseele*; Fr. (no exact equivalent—T.H.F.); Ital. (not in use). A term used by Emerson to express the Absolute Unity, in which subject and object, the knowing and the known, are one; the total reality in which are included all parts of the universe, and all our partial, successive

thoughts and acts. It connotes this absolute reality particularly as the source of all that is most universal and valuable in the experience of man: genius in his intellect, virtue in his will, and love in his emotions. See Emerson, *Essays*, 'Oversoul.' (J.D.)

Overtone: Ger. *Oberton*; Fr. *harmonique, ton supérieur*; Ital. *armonica, tono armonico*. The upper partial tones of a COMPOUND TONE (q. v.), i. e. those whose pitch is higher than the pitch of the fundamental. See TIMBRE.

Literature: HELMHOLTZ, *Sensations of Tone*, 25; SANFORD, *Course in Exper. Psychol.*, expts. 87-9. (E.B.T.)

Ovum [Lat. *ovum*, an egg]: Ger. *Ei*; Fr. *œuf, ovule, ovum*; Ital. *uovo, ovo*. The female sexual product or element.

The term is applied in four different senses, (1) to the ovarian cell or immature ovum, out of which the female product or mature ovum is developed; (2) to the mature ovum, or true female spore; (3) to the mature ovum plus the fecundating spermatozoon uniting with it—that is, to the impregnated ovum; (4) to various stages of the developing embryo. Cf. POLAR BODY, FERTILIZATION, CLEAVAGE, EMBRYO, HETEROLECITHAL, and HOMOLECITHAL.

Literature: MINOT, *Human Embryol.*, 48; E. B. WILSON, *The Cell*; Y. DELAGE, *Structure du Protoplasma* (1895); F. M. BALFOUR, *Compar. Embryol.* (1881). (C.S.M.)

Oxford Movement: see TRACTARIANISM.

Oxy- [Gr. *ὀξύς*, sharp]: Ger. *Oxy-*; Fr. *oxy-*; Ital. *ossi-* or *oxi-*. Abnormally acute or sharp; as oxyaesthesia, abnormally acute sensibility (occurs in hysteria); oxygeusia, an unusual acuteness of taste. (J.J.)

P

P — PAIN

P (in logic). (1) The predicate of a judgment.

(2) The major term of a conclusion, being the predicate of the major premise.

(3) In the mnemonic names for the moods of syllogism it signifies that the proposition denoted by the vowel after which this letter follows is, in the reduction to a direct mood, to be converted *per accidens*; as *Baralip-ton*, *Felap-ton*, *Darap-ti*. Such moods, from the Philonian point of view, are illogical. (C.S.P.)

Paganism [Lat. *paganismus*, from *paganus*, a rustic]: Ger. *Paganismus*; Fr. *paganisme*; Ital. *paganesimo*. A name applied to any non-Christian system that is polytheistic and unspiritual in its character and tendency.

The term paganism originated in the early period of Christianity as a name for heathenism which had its strongholds in the country as distinguished from the towns and cities. It came to be applied to all religions outside of Christianity except Judaism and, later, Mohammedanism. In current thinking the term carries with it the implication of a low degree of culture. (A.T.O.)

Pain and Pleasure [OF. *paine*, *plesir*]: Ger. (1) *Schmerz und Lust*; Fr. (1) *douleur et plaisir*; Ital. (1) *dolore e piacere*; for equivalents for (2) see PLEASANTNESS AND UNPLEASANTNESS. An antithesis of qualities which characterizes the affective aspect of consciousness. Cf. AFFECTION.

The pain (1) which attaches to organic conditions has recently been distinguished somewhat sharply from (2) so-called 'unpleasantness,' the former being considered, on the basis of considerable evidence, as a sensation (see PAIN SENSATION), the latter as a more general affective character attaching, with its

antithesis 'pleasantness,' to the mental life in all its phases. A similar distinction between (1) 'pleasure' and (2) 'pleasantness' is also made, but without the same amount of empirical evidence.

Theories of the general nature of the hedonic or pleasure-pain consciousness date from Aristotle. They deal, mostly without sufficient discrimination, with three relatively distinct problems: (1) psychophysical (the organic correlate of hedonic states); (2) psychological (the place of pleasure and pain in the development of conscious process); (3) genetic or biological (the origin and evolutionary significance of hedonic consciousness together with its organic correlate).

Terms which are to be met with in the discussions of the topic are hedonic (belonging to pleasure or pain), hedonics (the psychological theories of them), pleasure-pain and algedonics (terms suggested by Marshall as convenient for their double reference to both the hedonic qualities), hedonic consciousness (a supposed primitive consciousness or a purely abstract consciousness in which only hedonic differences are present).

Literature: see BIBLIOG. G, 2, e, and under EMOTION; also the textbooks of psychology (lists are given in VOLKMANN, DEWEY, BALDWIN, LADD, JODL). (J.M.B.)

Pain (aesthetic). Unpleasant aesthetic feeling. See PAIN AND PLEASURE (2).

Like aesthetic 'pleasure,' the word is employed in a wider sense to designate a total psychosis, whether simple or complex (e.g. an emotion), characterized by unpleasantness; and in a narrower sense as applying to the affective tone or aspect of such a psychosis. By certain authorities pain is regarded as

a merely negative aesthetic category, opposed to and limiting the pleasure felt in beauty. (Thus Lessing, in his theory of painting. Also Santayana, in his theory of aesthetics.) Other writers (e.g. Fechner) defend the disagreeable as of indirect aesthetic value, because it augments pleasure through contrast. It is generally admitted as a necessary feature of the pathetic and tragic (Schiller), and by many authorities is recognized as a factor in the sublime, whether as involving the element of terror (Burke) or (Kant) the element of formlessness akin to the UGLY (q.v.).

Literature: HAMILTON, Lects. on Met. (6th ed., 1877); MARSHALL, Pain, Pleasure, and Aesthetics (1894); BOSANQUET, Hist. of Aesthetic (1892); RIBOT, Psychol. of the Emotions (Eng. trans., 1897). (J.R.A.)

Pain Sensation: Ger. *Schmerz*; Fr. (*sensation de*) *douleur*; Ital. *dolore* (*sensazione di*). Pain which is also SENSATION (q.v.). See PAIN AND PLEASURE (1). (J.M.B.)

The sensation of pain has presented great difficulties to introspective analysis. This is due to two causes: (1) pain, the sensation, has been confused with the general affective state of unpleasantness or disagreeableness; (2) pain may be aroused in the skin and muscle that attach to any sense-organ. Hence it has been regarded as a 'common' sensation, producible by excessive stimulation of each and every organ; it has been referred to the organ itself instead of to the cutaneous and muscular attachments of the organ.

As regards cutaneous pain, we now possess evidence sufficient in the opinion of many to show that it is a specific sensation, resident in PAIN SPOTS (q.v.). In general, pain spots are more numerous even than pressure spots. Some suppose that the end-organs of pain are the free intra-epithelial nerve-endings of the epidermis. The pain organs in cutis, muscle, &c., are unknown.

Literature: VON FREY, Ber. d. k. sächs. Gesell. d. Wiss. (July 2, 1894; Dec. 3, 1894; March 4, 1895); Abhandl. d. k. sächs. Gesell. d. Wiss., xxiii. 3 (1896); HEAD, Brain (1893, 1894, and 1896); LEHMANN, Hauptgesetze d. menschl. Gefühlslebens (1892), 31 ff.; WUNDT, Physiol. Psychol. (4th ed.), i. 110 ff., 412, 419, 436 f., 557, 560; WITMER, Twentieth Cent. Pract. of Med., xi (1897); H. NICHOLS, Psychol. Rev., ii; and Philos. Rev., 403, 518; STRONG, The Psychology of Pain, Psychol. Rev. ii, July, 1895; MANTEGAZZA, Fisiol. del dolore; SERGI, Dolore e piacere. Cf. HAPTICS, and SUMMATION. (E.B.T.-J.M.B.)

Pain Spots: Ger. *Schmerzpunkte*; Fr. *points de douleur*; Ital. *punti di dolore*, *punti algesici*. Spots of peculiar sensitiveness to pain, interspersed among the pressure and temperature spots of the skin. Cf. PAIN SENSATION, and TEMPERATURE SPOT.

A map of distribution, values of liminal stimulus, &c., are given by von Frey, *Abhandl. d. k. sächs. Gesell. d. Wiss.* (1896). (E.B.T.)

Palatals: see PHONETICS.

Paleontology [Gr. *παλαιός*, ancient, + *ὄντα*, beings, + *λόγος*, discourse]: Ger. *Palaeontologie*; Fr. *paléontologie*; Ital. *paleontologia*. The science of extinct or fossil animals and plants. (C.S.M.)

Literature: H. ZITTEL, Handb. d. Paleontologie; NICHOLSON and LYDEKKER, *Palaeontology*. (E.S.G.)

Paley, William. (1743-1805.) Educated at Christ's College, Cambridge. Fellow of Christ's College, 1766; lecturer on moral philosophy and divinity, 1768; took orders in the Anglican Church; rector at Musgrave, 1775; vicar of Dalston, 1776; prebendary (1780), archdeacon (1782), and chancellor (1785) of Carlisle; prebendary of St. Paul's, London, 1793; sub-dean of Lincoln and rector of Bishop Wearmouth, 1795.

Palingenesis [Gr. *παλιν*, again, + *γένεσις*, becoming, birth]: Ger. *Palingenese*; Fr. *palingenèse*; Ital. *palingenesi*. (1) The doctrine that the soul passes through a succession of rebirths: METEMPSYCHOSIS (q.v.).

(2) Also sometimes used, in theological writings, to express REGENERATION (q.v.), of which it is the literal equivalent.

(3) The term has a technical philosophic significance only in the writings of Schopenhauer, who uses it to express the fact that will is untouched by death, and reappears in a new individual, until the will-to-live is completed, denied, and abrogated. He distinguishes it from metempsychosis as the vulgar doctrine that the concrete 'soul' reappears, but claims it is identical with the esoteric teaching of Buddhism (Schopenhauer, *The World as Will and as Idea*, trans. by Haldane, iii. 300-1). (J.D.)

Palingenesis (in biology). The development of an individual which truly copies or repeats ancestral development.

The term was proposed by Haeckel as the opposite of Cenogenesis, the development of an individual which is false to its lineage or ancestry. Cf. BIOGENETIC LAW, ONTOGENY, and RECAPITULATION. (C.S.M.)

Palingenetic Characters: see PALINGENESIS, and BIOGENETIC LAW.

Palmistry [Lat. *palma*, the palm of the hand]: Ger. *Chiromantik*, *Handdeuterei*; Fr. *chiromancie*; Ital. *chiromanzia*. A pseudoscience whose devotees claim to read character, and to foretell the future by the lines and marks of the palm of the hand. Cf. CHIROMANCY, and GRAPHOLOGY. (J.J.)

Pantheism [Gr. *pān*, all, + *év*, in, + *θεός*, God]: Ger. *Pantheismus*; Fr. *panthéisme*; Ital. *panenteismo*. A name given by Krause to his attempted reconciliation of theism and pantheism; the doctrine that God is neither the world, nor yet outside the world, but that the world is in him, and that he extends beyond its limits. (J.D.)

Pangeneses: Ger. *Pangeneses*; Fr. *pan-génèse*; Ital. *pangenesi*. The name given by Darwin to the hypothesis of heredity, which he originally formulated, that the cells of the parent 'throw off minute granules or atoms, which circulate freely throughout the system, and when supplied by proper nutriment multiply by self-division, subsequently becoming developed into cells like those from which they were derived. The granules may be called *gemmules*. They are supposed to be transmitted from the parents to the offspring, and are generally developed in the generation which immediately succeeds, but are often transmitted in a dormant state during many generations, and are then developed' (Darwin, *Animals and Plants under Domestication*, ii. chap. xxvii).

Modifications of the hypothesis have been suggested by W. R. Brooks, H. de Vries, and others, but the hypothesis is not now accepted in any form by the majority of biologists.

This provisional hypothesis was first published in 1860. As subsequently remodelled, it involves the following assumptions (summarized by Romanes):—

(1) That all the component cells of a multicellular organism throw off inconceivably minute germs, or 'gemmules,' which are then dispersed throughout the whole system.

(2) That these gemmules, when so dispersed and supplied with proper nutriment, multiply by self-division, and under suitable conditions are capable of developing into physiological cells like those from which they were originally and severally derived.

(3) That, while still in this gemmular condition, these cell-seeds have for one another a mutual affinity, which leads to their being collected from all parts of the system by the reproductive glands of the organism; and that, when so collected, they go to constitute

the essential materials of the sexual elements—ova and spermatozoa being thus aggregated packets of gemmules, which have emanated from all the cells of all the tissues of the organism.

(4) That the development of a new organism, out of the fusion of two such packets of gemmules, is due to a summation of all the developments of some of the gemmules which these two packets contain.

(5) That a large proportional number of the gemmules in each packet, however, fail to develop, and are then transmitted in a dormant state to future generations, in any of which they may be developed subsequently, thus giving rise to the phenomena of reversion or atavism.

(6) That in all cases the development of gemmules into the form of their parent cells depends on their suitable union with other partially developed gemmules, which precede them in the regular course of growth.

(7) That gemmules are thrown off by all physiological cells, not only during the adult state of the organism, but during all stages of its development; or, in other words, that the production of these cell-seeds depends upon the adult condition of parent cells, not upon that of the multicellular organism as a whole.

In this theory Darwin attempted to account for the transference to the germinal cells not only of the effects of use and disuse in other cells, but also of the normal characteristics of the physiological tissues. It is now questioned whether the effects of use and disuse are thus transferred; while the recurrence of similar characteristics of the physiological tissues is, by many biologists, explained as the result of the continuity of the germinal substance, the germinal substance of generations *p, q, r* being in direct continuity with that of their predecessors *m, n, o*. Cf. HEREDITY, and LIVING MATTER.

Literature: C. DARWIN, *Animals and Plants under Domestication*; A. WEISMANN, *The Germ-Plasm*; W. K. BROOKS, *The Law of Heredity* (1883); H. DE VRIES, *Intracellulare Pangeneses*; G. J. ROMANES, *Darwin and after Darwin*. (C.L.L.M.)

Panlogism [Gr. *pān*, all, + *λόγος*, thought, reason]: Ger. *Panlogismus*; Fr. *panlogisme*; Ital. *panlogismo*. A term applied to philosophic systems which make thought the absolute—usually to the system of Hegel. (J.D.)

Panmixia [Gr. *pān*, all, + *μῖξις*, a mixing]: Ger. *Panmixie*; Fr. *panmixie*; Ital. *panmissia*. Promiscuous interbreeding within the

limits of a species or other group as contrasted with breeding under artificial selection or other form of isolation. (C.L.L.M.—J.M.B.)

Romanes drew attention to the effects of cessation of selection, which involves the perpetuation of mediocrity. Weismann laid stress on the promiscuous interbreeding which results, and termed it panmixia. The dwindling of vestigial organs was attributed by both authors in large degree to panmixia with cessation of selection. Lankester and others contend that, in the absence of other factors, there could be no dwindling beyond the existing birth-mean of the species, and economy of growth and germinal selection have been suggested as additional factors. Pearson claims to have demonstrated, mathematically, that 'panmixia without active reversal of natural selection does not lead to degeneration' (on the basis of GALTON'S LAW, q. v., of ancestral heredity). Cf. AMIXIA.

Literature: WEISMANN, *Essays*, i; *The Germ-Plasm*; *Germinal Selection*; ROMANES, *Darwin and after Darwin*, ii; PEARSON, *Proc. Roy. Soc.*, meeting of Jan. 27, 1898, and *Science*, Mar. 11, 1898, 339. (C.L.L.M.)

Panpneumatism [Gr. *πᾶν*, all, + *πνεῦμα*, spirit]: Ger. *Panpneumatismus*; Fr. *panpneumatisme*; Ital. *panpneumatismo*. A term used by v. Hartmann (only) to designate a 'higher synthesis of PANLOGISM (q. v.) and PANTHEISM (q. v.), according to which the absolute is both will and thought.' (J.D.)

Panpsychism [Gr. *πᾶν*, all, + *ψυχή*, soul]: Ger. *Panpsychismus*, *Allbeseelung*; Fr. *panpsychisme*; Ital. *panpsychismo*. (1) The theory that all matter, or all nature, is itself psychical, or has a psychical aspect; that atoms and molecules, as well as plants and animals, have a rudimentary life of sensation, feeling, and impulse, which bears the same relation to their movements (whether causal or parallel) that the psychical life of human beings does to their objective activities. The theory is a revival, under conditions of modern science, of ancient ANIMISM (q. v.) and HYLOZOISM (q. v.).

(2) The term is also used (as by Windelband) to designate the Arabian interpretation of Aristotle's doctrine of reason, according to which man's reason is but a special mode of an eternal, impersonal divine Reason. See AVERROISM.

Literature: FECHNER, *Ueber die Seelenfrage*; NANNA, *Zend-Avesta*; PAULSEN, *Introd. to Philos.* (Eng. trans.), 91, 99, 131; citations in EISLER, *Wörterb. d. philos. Begriffe*, 'Panpsychismus.' (J.D.)

Pantheism [Gr. *πᾶν*, all, + *θεός*, God]: Ger. *Pantheismus*; Fr. *panthéisme*; Ital. *panteismo*. (1) The term has a wide and loose meaning, especially in controversial writings, where the *odium theologicum* attaches to it; in this way it is used to designate almost any system which transcends current or received THEISM (q. v.) in its theory of a positive and organic relation of God to the world.

Theism, when combined with philosophical dualism, as it is quite apt to be, tends naturally to become DEISM (q. v.), assuming an external and mechanical relation of God to the world of nature and of man. This calls out a reaction on both philosophic and religious grounds. The former reaction occurs because of the difficulties felt in an external relation of the infinite and finite. The latter is made independent, and thus the former practically becomes itself a finite. The connection between them is made one of causation and design merely. Difficulties arise from applying the category of causation to the infinite, especially as the cause is moved back indefinitely in time; while the notion of design is used in such a way as to imply that God is simply an external artificer or mechanic. The religious reaction arises because this external relation does not allow of the intimate communication of the human and divine spirits, the sense of absorption and permeation, which seem to be required by deep religious experience. Hence the attempts to bring the finite into more essential and intrinsic relations to God. If these attempts are animated particularly by the religious motive, they tend to MYSTICISM (q. v.), which is closely akin to pantheism. But, in any case, they are condemned by the deists as tending to swallow up the finite in God, or as pantheistic. As will be evident, even from this brief outline, it is a matter of the nicest balance to keep, especially in Christian theology, the theory of the relation of God as infinite to the world as finite, from leaning to pantheism on one side or to deism on the other.

(2) In its narrower and proper philosophic sense, pantheism is any system which expressly (not merely by implication) regards the finite world as simply a mode, limitation, part, or aspect of the one eternal, absolute Being; and of such a nature that from the standpoint of this Being no distinct existence can be attributed to it. The chief problem of pantheism understood in this way, i. e. as acosmism, is to account for the appearance of self-

subsistence, or separate being, belonging to the finite world.

The Eleatic school (see PRE-SOCRATICS) may be regarded as the forerunners of pantheism in their insistence upon the unity and all-comprehensiveness of true Being. The distinction between finite and infinite, God and the world, had not, however, been made sufficiently clear at this time to justify calling the system pantheism. Through Plato and Aristotle the terms of the problem, both in themselves and in their relation to each other, are made evident. NEO-PLATONISM (q. v.) and STOICISM (q. v.) are both pantheistic. The former is of a logical idealistic type, based upon Plato's theory of the relation of the One Being, *Nous*, and the Ideas; teaching that the world is simply one of a series of emanations from God, radiating from him, as light from the sun, and having its apparent distinction only through a negative element, Non-Being or Matter. Stoicism is a development of Aristotelianism under the influence of the earlier Greek cosmologists, especially Heraclitus.

Neo-Platonism, and some of the congruent ideas of the Stoics (especially of the λόγος σπερματικός), influenced the formation and development of Christian theology; and pantheistic tendencies in the latter accordingly crop out, as in Scotus Erigena (see SCHOLASTICISM) and in the mystics, like Eckhart and Boehme. The doctrines particularly influenced are those of the Trinity and Creation (the latter being a continuation of the quasi-emanistic process which finds its expression in the incarnation of the Father in the Logos, and in the activity of the Spirit); of Redemption, conceived as the necessary return to God, thus completing the circuit, whose first half is the unfolding of the world from God in creation; of religious experience, as the immediate, unhindered, ecstatic converse of the human spirit with God. AVERROISM (q. v.) gave a pantheistic interpretation of Aristotle, and is perhaps even more influential than Neo-Platonism in all the later developments of pantheism, particularly as it is more allied in content and terminology to a scientific view of nature. In Giordano Bruno, this latter motive culminates in a poetic personification of nature; and the humanistic view of the universe displaces the factor of religious experience, so important in mediaeval thought. Later John Toland presented a naturalistic pantheism, identifying God with the forces of nature.

Averroism came to Spinoza through its in-

fluence upon Jewish thought, and is by him combined with the mediaeval religious motive, the modern scientific one, and with the problem of Cartesian philosophy regarding the relation of mind and matter in a splendid synthesis which makes him the classic type of pantheistic thought. Spinoza's influence was felt first not in philosophy, but in literature, in Herder, Lessing, and above all in Goethe. Schelling revived pantheism in connection with the problem of subject and object (which had displaced the Cartesian problem of mind and matter) in his philosophy of identity. Hegel attempted here as elsewhere a synthesis of ideas in opposition to each other, viz. theism and pantheism. He adopted the monistic factor of Spinoza, but seized upon his statement that *determinatio est negatio* as the explicit definition of the root of all pantheism (or absorption of the finite into the infinite), and reversed it to mean all negation is determination: i. e. negation is ultimately positive, being the dynamic factor through which Being actualizes itself into full, concrete individuality. Hegel's system broke up into two schools, one avowedly pantheistic (as in Strauss); the other atheistic, holding that God comes to existence merely and only in the evolution of human individuals. v. Hartmann holds that only pantheism is henceforth philosophically possible; Hegel and Schopenhauer, holding principles which in their opposition are exhaustive of the universe, being both pantheists. But by pantheism v. Hartmann seems to mean especially MONISM (q. v.), an identification of terms which seems to be growing, though to be deprecated from the point of view of clearness of thought. Herbert Spencer alternates between a pantheism, in his theory of the absolute unknowable force, and a dualism, in his theory of the relation of mind and matter, subject and object.

Literature: for the most part we must rely upon works upon and by the individual authors, especially SPINOZA. JUNDT, *Hist. du Panthéisme populaire* (1876, confined to mediaeval pantheism and Eckhart); JÄSCHE, *Der Pantheismus* (1826); most works on THEISM (q. v.) and antitheistic theories, and the introductions to philosophy (e. g. PAULSEN). See also BIBLIOG. B, 2, f. (J.D.)

Pantheism [Gr. *παν*, all, + *θελειν*, to wish, will]: Ger. *Pantheismus*; Fr. *panthéisme*; Ital. *panтелismo* (de Sarlo). The doctrine that will is the basis of the universe; that it is the absolute, or, in a more limited sense, that

reason (intellect) is subordinate to the will, and is to be derived from it.

The term is applied to such systems as Fichte's, with its derivation of knowing from acting, and to Schopenhauer's. See VOLUNTARISM. Cf. Falckenberg, *Hist. of Mod. Philos.* (Index), and Francesco de Sarlo, *Metafisica, scienza e moralità* (1898). (J.D.)

Para- [Gr. *παρά*, beside]: Ger. *para-*; Fr. *para-*; Ital. *para-*. A prefix indicating in pathological terminology a condition deviating from the normal, a perversion; as paraesthesia, subjective and abnormal sensation (such as 'tingling' or 'pricking'); paraesthesia, a perverted or morbid taste; paragrafia, the making of mistakes in writing; paralexia, misreading, or difficulty in reading; paraphrasia, incoherent speech. See PARALYSIS, and PARANOIA. (J.J.)

Paracelsus. The assumed name of Philippus Aureolus Theophrastus Bombastus von Hohenheim (1493-1541). The son of a physician, he chose the same calling, but wandered about studying the works of alchemists and magicians, gathering information from strange sources as to the art of healing; received the degree M.D.; was military surgeon in Denmark and Italy; professor of medicine and surgery in Basel, 1527; compelled to leave by the Galenic physicians.

Paradox [Gr. *παρά*, contrary to, + *δόξα*, opinion]: Ger. *paradox* (adj.); Fr. *paradoxe*; Ital. *paradosso*. An opinion surprising or repugnant to an ordinary mind. See De Morgan's *Budget of Paradoxes*. (C.S.P.)

Parallelism (in biology) [Gr. *παρά* + *ἀλλήλων*, of one another, from *ἄλλος*, other]: see CONVERGENCE, and cf. PARALLELISM (psychophysical).

Parallelism (psychophysical): Ger. *psychophysischer Parallelismus*; Fr. *parallélisme psychophysique*; Ital. *parallelismo psicofisico*. The affirmation that conscious process varies concomitantly with synchronous process in the nervous system, whether the two processes have a direct causal relation or not.

This is the most generally accepted view of the relation between mind and body at the present day. A good statement of it from the point of view of psychological method is given by G. E. Müller, *Zur Psychophysik der Gesichtsempfindungen*, in *Zeitsch. f. Psychol.* (1896), 1-25, and another by Mach, *Analysis of Sensation*, 26-40 (Eng. trans.). The principle of psychophysical parallelism involves no explanatory theory of the connection between conscious and nervous process.

Those who accept it may differ on this point very widely. A view often associated with it is Automaton Theory; this denies all agency to consciousness. But those who hold psychophysical parallelism are by no means bound down to this opinion. Clifford, for example, writes as follows: 'A feeling of chill made a man run; strictly speaking, the nervous disturbance which coexisted with that feeling of chill made him run, if we want to talk about material facts, or the feeling of chill produced the form of subconsciousness which coexists with the motion of legs, if we want to talk about mental facts' (quoted by James, *Princ. of Psychol.*, i. 132). Cf. AUTOMATIC AND AUTOMATISM (3), DOUBLE ASPECT THEORY, and MIND AND BODY. (G.F.S.-J.M.B.)

The theory may be extended to apply to the concomitance of conscious and vital process in the evolution of organic forms. This

P, phylogeny; O, ontogeny.

application would constitute a theory which might appropriately be called phylogenetic or racial parallelism, as the application to the individual's psychophysical development constitutes ontogenetic or individual parallelism. The theory in its twofold application thus constitutes a great way of looking at one of the main topics of genetic philosophy. If we represent the mental series by dotted lines (*M, m*: mind) and the physical by solid lines (*B, b*: body), the two applications of parallelism at the grade of organic evolution represented by any particular animal, *O*, may be shown, as in the accompanying diagram (the relative position of the parallels *O* upon the parallels *P*).

The discussions of psychophysical parallelism have hitherto been in the main restricted to the problem of individual development. The application to racial evolution, however, is an essential part of the view, and should be given equal attention; for no theory of

the relation of mind and body can be permanently established which does not explain the racial concomitance of the two. Furthermore, the biological theory of descent must recognize mental evolution along with, and possibly as essential to, organic evolution; and the problems thus arising for the psychologist and philosopher cannot be set aside. We may note, for example, the questions of mental RECAPITULATION (q.v.) and morphology generally as bound up with those of comparative brain anatomy and morphology.

Literature: besides the titles mentioned, see MIND AND BODY, and the Psychological Index, in loc.; also MASCI, Il mater. psicofisico (1901). (J.M.B., G.F.S.)

Parallelogram of Forces: Ger. *Parallelogramm der Kräfte*; Fr. *parallélogramme des forces*; Ital. *parallelogramma delle forze*. The law of composition of two forces acting on a point, expressed in this way: If two forces,

represented in intensity and direction by the lines PF and PG , act on a point P , the resultant will be represented in intensity and direction by the diagonal PR of the parallelogram $PGRF$. (S.N.)

Paralogism [Gr. *παρά + λόγος*, discourse]: Ger. *Paralogismus*; Fr. *paralogisme*; Ital. *paralogismo*. A REASONING (q.v.), especially a syllogistic reasoning, which is logically faulty and deceives the reasoner himself. Cf. FALLACY. (C.S.P.)

Paralysis [Gr. *παρά + λύσις*, a loosing]: Ger. *Paralyse*; Fr. *paralysie*; Ital. *paralisi*. The complete or partial loss of function of the neuro-muscular mechanisms. The term is preferably used for the loss of the power of movement.

Partial loss is called paresis. It may involve single muscles, or those supplied together by one or more nerves (with or without implication of the sensibility of the corresponding sensory surface), or one extremity, or both legs, or the movements of one side. Paralyses are usually distinguished symptomatically as organic and functional, by their nature as sensory and motor, and from the localization of the disorder as peripheral, spinal, infracortical,

cortical, or psychic. The division into organic and functional (according to whether or not there is an anatomically demonstrable lesion) cannot be rigidly maintained, but is sufficiently well established for medical purposes. For these various forms see the textbooks on nervous diseases. Cf. MOVEMENT (disorders of).

When spoken of as a disease, paralysis is ordinarily used as a synonym of *general paralysis*, or general paresis, which is both historically and pathologically one of the most interesting of mental diseases. It was first described as a 'disease occurring among the insane,' a fatal complication of mania. The first descriptions of Bayle (1822 and 1825), Georget (1823), Calmeil (1826), and Parchappe (1832) maintain that it is a special disease from the beginning; the latter called it *folie paralytique*. Baillarger and Requin (1846 and 1847) taught that it was a combination of two diseases, the one affecting the motility, the other affecting the psychic organ. Delasiauve (1851) and Falret (1853) rehabilitated the view of Bayle and Calmeil, which is now universally accepted.

General paralysis is a disease-process which (like locomotor ataxia) is most probably to be regarded as a metasyphilitic degeneration of the nervous system, although the fact that in a certain number of cases the syphilitic origin is denied by the patient cannot be ignored. Alcoholism and unhygienic conditions of life generally are the chief secondary causes. Krafft-Ebing sums up the etiology with the words syphilization and civilization. Most cases occur between the ages of thirty and fifty, but cases during adolescence (probably hereditary syphilis) are not uncommon.

The fundamental characteristic of the disease is a rapid or slow progressive deterioration of memory, working capacity, and judgment, and profound change of character, with a more or less parallel development of tremor and ataxia, especially of speech and writing, and other signs of organic degeneration in the nervous system, and finally profound dementia, with more or less sensory and motor paresis. The entire sequence of symptoms from the first to the almost inevitably fatal ending covers a period of from six months or less to from four to six or more years, with an average duration of thirty-two months. These fundamental traits are frequently, but not always, connected with various accessory psychic symptom-complexes which appear in similar form also in other disease-processes. Hence we recognize a 'simple demented

course,' or a course with the appearance of extensive delusional fabrications and the performance of absurd enterprises and even criminal actions. Such abnormal conduct is due in part to the progressive defect of memory and of judgment; or it is a feature of an expansive excitement (in rare cases of depression), presenting the well-known megalomania in ideas of enormous wealth and strength, inventions, schemes, ability to raise the dead, &c., or delusions of the most abject misery; or it may begin like a case of paranoia, or as epilepsy. A further characteristic possibility is the occurrence of peculiar attacks of convulsions, or apoplectiform stupor. Hallucinations and truly depressive episodes are rare.

There is hardly a symptom or symptom-complex that will not occur occasionally in a case of general paralysis (see the enumeration of symptoms in Mickle's article in *Tuke's Dictionary of Psychological Medicine*); and the disease well illustrates the necessity of a distinction between the concepts disease-process and essential and casual symptoms (cf. PSYCHOSSES). Occasionally the downward course is arrested for some time, and in rather rare cases a complete remission occurs, leaving but little or no defect, so that it might represent a recovery if it did not end in the final fatal relapse with almost absolute certainty.

It should be noted that but few cases of syphilis develop into general paralysis. There is at present no adequate basis for explaining the course of the development of the disease in individual cases; why in one case of infection no further symptoms ensue, and in another, perhaps after six or more years, locomotor ataxia or general paralysis; and in the latter case, why the disease takes the spinal ataxic form (with early absence of knee-jerks) or the cerebral form (with exaggerated knee-jerk), or begins with epilepsy or attacks of transitory aphasia; or why it assumes an expansive, paranoic, or purely demented type.

Although pathological histology gives a clear picture of decay of nerve elements, and especially of increase of neuroglia and alteration of blood-vessels, there is still great difference of opinion as to which one (if any) of these lesions is the primary process; the diffuseness of the lesion over the whole nervous system makes it also quite difficult to establish even a parallelism between the lesion and the symptoms, except in the most general way. (A.M.)

Lesions of Paralysis. The causes of paralysis

vary between wide limits. An inflammation of the spinal cord (myelitis) or of the peripheral nerves (neuritis) may produce an acute ascending (Landry's) paralysis in which control over the muscles of the legs, trunk, arms, and, finally, of the head, is progressively lost. In cases of sclerosis of the lateral columns of the cord a motor paralysis with increase of tendinous reflexes, known as spastic spinal paralysis, occurs.

Bulbar paralysis—of the motor centres of the medulla—results in interference in articulation, deglutition, and innervation of the face and eyelids. Degeneration and atrophy of the cells of origin of the glossopharyngeal and facial nerves, as well as atrophy of their root-fibres, are features.

Cortical paralysis due to injury or disease of the motor areas requires no other explanation. Purely functional motor and sensory paralyzes in hysteria must be looked upon as cases of abnormal central inhibition allied to hypnotic disassociation. Lead poisoning and other intoxications give rise to localized peripheral paralyzes, the aetiology of which is obscure.

General paralysis (*dementia paralytica progressiva*) is primarily a disease of the brain, and one in which characteristic lesions rarely fail to be developed. Syphilis is the most prominent cause. It is still a question whether the primary lesion is in the nervous, vascular, or sustentative (neuroglia) system, as all are affected. In the case of alcoholic paralysis the circulating medium is thought to form the point of departure. The vascular troubles begin with hyperaemia, which passes into an inflammatory condition of the walls. These are associated with degenerative changes in the specific nerve-tissue and proliferation and swelling (afterwards shrinking) of the sustentative apparatus.

While it seems to be true that the first demonstrable alterations in the nervous apparatus consist in destruction of the fine gemmules of the dendrites, it may be assumed that obscure changes are concomitantly taking place in the cell protoplasm. Soon well-marked foci of degeneration occur in the cell, and nodosities on the processes. The blood-vessels become distended and the walls thicken, and finally the adventiva cells proliferate, narrowing the lumen. Great dilation of the perivascular and pericellular lymph spaces is inaugurated. Inflammatory processes with exudation are found in late stages or acute cases and the meninges participate and become

adherent. The destruction of tissue is commonly greatest over motor regions (see Plate I, DEGENERATION). General paralysis may be inaugurated by spinal symptoms resembling tabes, sclerosis, bulbar paralysis, and neuritis.

Paraplegia: the destruction of the voluntary motor functions of both symmetrical halves of the body, usually of both the lower extremities.

Hemiplegia: a paralysis of voluntary motion of one side, usually as a result of softening of the cerebral motor centres. It is not necessarily complete.

Monoplegia: a paralysis limited to one limb or a single group of muscles.

Hemiparesis: an impairment (rather than complete paralysis) of the organs of voluntary motion of one side, or especially of the limbs.

Monoparesis: impairment of the power of single groups of muscles from focal brain lesions. (H.H.)

Psychic or mental paralysis; motor inability from mental causes (e.g. suggestion, hysteria, &c.). (J.M.B.)

Literature: MENDEL, *Die progressive Paralyse der Irren* (1880); VOISIN, *Traité de la Paralyse générale* (1879); MICKLE, *General Paralysis of the Insane* (2nd ed., 1886); KRAFFT-EBING, *Die progressive allg. Paralyse*, in Nothnagel's *Handbuch*, ix. Pt. II (1894, with good bibliography). (A.M.)

Paranoia [Gr. *παρά + νόος*, reason]: the same in the other languages. A term first used by Vogel (1772) and Heinroth (1818), and taken up by Kahlbaum (1863), to designate that form of partial insanity (see MONOMANIA) which throughout the course of the disease affects mainly the sphere of intellect.

Following Mendel and Morselli, the term has since been used to cover the expressions *Verrücktheit* (Griesinger, Sander) and *Wahnsinn* (Westphal), and by the Italians, Werner, and Ziehen, to include acute and chronic and simple and hallucinatory delusional insanity. Greater clearness has been attained by Tanzi, Wernicke, and Kraepelin, who return to the original chronic forms with systematization of the delusions.

The paranoid symptom-complex presents the following features:—In an apparently normal or, at least, rational individual some inadequate concepts may emerge while otherwise mental activity is normal; either a whim, a more or less erroneous delusional or over-rated (dominant) view, or a hallucination or illusion, with the subjective value of a real sensation, or an autochthonous idea, i.e. a con-

cept springing up in the patient's mind, but appearing strange though actual to him, not referred to a real afferent sensation or hallucination, but rather to some unaccountable spontaneity, outside influence, &c. ('somebody gives me bad thoughts'), or strange imperative concepts. When these new morbid factors are assimilated and become abnormally dominant, although they need not secure a deep influence on the valuation of other views by the patient, we speak of a paranoid condition, a state of mind unable to correct the delusion notwithstanding an otherwise reasonably critical attitude.

If the assimilation leads to distortion of formerly well-recognized relations, and to retrospective falsifications, we speak of a paranoid condition with systematization (*Verrücktheit*). When the new concepts are ushered in suddenly, often with a certain difficulty in the intellectual process of grasping things generally, the Germans speak of *Wahnsinn*, a term usually translated as acute delusional insanity, or perhaps better called delirium with orientation, i.e. with a fair realization of the bearings of surroundings. If, however, the new concepts (hallucinatory or otherwise) interfere with the orientation of the surroundings, and the elaboration also of ordinary impressions and their bearing, the term delirium is used.

In keeping with the nosological conceptions developed under the topics PSYCHOSES, MANIA, and MELANCHOLIA, the paranoid symptom-complex is not considered a disease-entity, except where the evolution of the disease gives it a specific character. What is described as acute paranoia (hallucinatory or not) is either an equivalent of the periodic manic-depressive insanity, or an equivalent of psychoses, which as often take the type of delirium (toxic or connected with infectious or exhausting conditions), or perhaps the beginning of a process of deterioration—*dementia praecox* or *katatonia*. In the midst of relative mental health, often with slight provocation, sleeplessness and a certain uneasiness appear, followed more or less promptly by hallucinations or delusions, such as that people are persecuting the patient with threats and slander, putting poison in his food, tormenting him with electricity, &c. Not infrequently the patient asks the police for protection; or in alcoholics, suspicions may appear as to the wife's faithfulness; noises occur in the house; the light and the position of the blinds are signs of some secret understanding, &c. Or

God or angels appear to the patient, saying 'Love one another,' 'Do your duty.' The patient begins to act strangely, is absorbed, but with it all he is capable of a fair grasp of the situation outside of his delusional sphere. The delusions may persist throughout the attack, with no systematization.

The true paranoic conditions are properly divided into: (1) paranoia proper, an abnormal development of the personality allied to constitutional inferiority (psychopathische Minderwertigkeit), many forms of which (folie de doute, &c.) might well be called rudimentary paranoia, remarkable for their persistence within definite lines of aberration and lack of tendency to pass into dementia or other forms of insanity. These forms are mainly a consistent elaboration of convictions (e.g. Magnan's folie des antivivisectionnistes) or traits of character. Some underrated genius with his invention of the perpetuum mobile, or the squaring of the circle, the kidnapped heir, the victim of Jesuits, the querulant who fights for his grievances until the courts recognize the morbid state of the complaint, or a Guiteau acting under inspiration, are well-known types. Apart from exacerbations of restless activity, and perhaps an occasional hallucination, there is always a complete system of correlation of even trivial facts, occasionally with additional falsifications of the past put together to demonstrate the fiendish machinations of open and secret persecutors or the evidence for noble birth, &c. The beginning of the disorder often points back to early youth and a self-conscious make-up, with suspicions of being observed, criticized, and an inclination to see meanings in trivial things (feelings and delusions of reference; or of interpretation, Beziehungswahn). Resignation in the unavoidable fate is often accompanied by rather absurd ideas of grandeur, but with little intellectual weakness.

(2) Paranoic conditions are types belonging to the group of processes of mental deterioration: dementia praecox, alcoholic deterioration, and especially the deterioration in the period of involution. It is on this ground that greatly varied hallucinatory and autochthonous forms most frequently develop, usually after the thirty-fifth year, and especially often in women shortly before the menopause.

On the basis of some prolonged physical or mental malaise, the patient begins to misinterpret trivial occurrences, hears an insulting voice, or has some unaccountable sensation,

or gets a strange idea. Vague suspicion is thrown on people in the next house; the voice is referred to electric wires and telephones, or a strange sensation (frequently of a sexual nature) to hypnotism and mesmeric influence. Things which happened long ago receive their 'consistent' interpretation, and are elaborated in a delusional system, often with many retrospective falsifications; the patient develops an exaggerated feeling of importance, and frequently ends as queen, as god, as governor, &c., without any realization of the discrepancies in the situation, and with various degrees of dementia. Recovery is very rare, but some patients may be able again to return to a quiet existence outside of the hospitals.

In English and American hospitals these types are frequently called chronic mania or chronic delusional insanity.

(A.M.)

Paraphasia: see SPEECH AND ITS DEFECTS, V, (a).

Paraplegia: see PARALYSIS.

Parasite [Gr. *παράσιτος*, one who eats at another's table]: Ger. *Parasit*; Fr. *parasite*; Ital. *parassito*. An organism that lives in, or on, or at the expense of, another animal, called technically the host.

Familiar examples of external, or ecto-parasitic, animals are the flea and louse; of internal, or endo-parasitic, animals, the liver-fluke and tapeworm. Cf. DEGENERATION.

Literature: LEUCKART, Die menschlichen Parasiten, 2 vols.; VAN BENEDEN, Animal Parasites and Messmates. (C.S.M.—E.S.G.)

Pardon (in theology) [L. Lat. *per* + *donare*, to give]: Ger. *Vergebung*; Fr. *pardon*; Ital. *perdono*. The gracious act of God whereby he remits the penalty of sin on the repentance and faith of the sinner.

Pardon is an act of grace and mercy without regard to desert. Pardon remits the penalty but does not communicate any merit. For this reason it is to be distinguished from justification, which rests primarily on the imputation of the merit of Christ's obedience to the sinner.

Literature: DWIGHT, Theology; GRIFFIN, The Atonement. Also works on systematic theology. (A.T.O.)

Paresis [Gr. *πάρεσις*, a letting go, paralysis]; Ger. *Parese*; Fr. *parésie*; Ital. *paresi*. A partial or incomplete degree of PARALYSIS (q. v.); weakness in the use of a limb. (J.J.)

Parietal Organ: Ger. *Scheitellaug*, *Parietalaug*; Fr. *organe (ou œil) pariétal, pinéal*; Ital. *terzo occhio, occhio pineale*. An eye-like organ found in various vertebrates occupying a special fontanel in the dorsal median line of the skull; called also Parietal Eye, Pineal Gland, and Epiphysis.

The parietal organ is best seen in certain reptiles, in which it may even be functional. It arises as an evagination of the epiphysis (cf. BRAIN). The eye develops a retina and lens, and is connected with the roof of the diencephalon by the parietal nerve. The epiphysis itself seems to sustain much the same relation to the parietal eye that the optic evaginations do to the paired eyes. Authors are as yet not agreed as to the origin of the parietal eye and its relation to the epiphysis. Several recent authors have found evidence that the epiphysis and the parietal organ were originally paired. Locy especially reports paired rudiments of the epiphysis in selachians, yet this is questioned by the most recent writers (Eycleshymer and Davis, 1897).

Leydig (1872) and Spencer (1886) suspected the sensory character of the organ, and, though one recent author (Rabl-Rückhard) has assigned to it a function connected with the temperature sense, there is every reason to regard the epiphysis and parietal organ as a degenerate visual apparatus. The epiphysis itself is tubular in fishes, vesicular in amphibians, vesicular and glandular in reptiles, and glandular in mammals.

Parity [Lat. *paritas*, from *par*, equal]: Ger. *Gleichheit*; Fr. *parité*; Ital. *parità*. Equivalent to equality. *Parity of reasoning* is the precise analogy of two arguments both in their nature and in their force. (C.S.P.)

Parousia [Gr. *παρίειναι*, to be present]: Ger. *Parusie*; Fr. *parousie*; Ital. *parusia*. (1) A semi-technical term used by Plato to express relationship between absolute being or essence and the sensible world. It is closely allied to his more specifically technical terms participation (*μέθεξις*) and community (*κοινωνία*). The world of sense has essence and existence only through the presence of the good in it (*Politics*, 509).

(2) It is employed as a technical term by Plotinus to express the relation of soul and body. The soul is not present in the body, but is rather present to it. More strictly, Plotinus says the body is present to the soul. Through this relation, sentience and vitality are rendered to the body. By parousia the soul thoroughly animates and permeates the body without getting in any way entangled with it (Plotinus, *Enneads*, vi. 4, 12).

(3) The term is used in early Christian thought to express the relation of the Holy Spirit to the individual and the Church. It is a matter of dispute whether this use is influenced by the technical philosophical discussions. (J.D.)

Paroxysm [Gr. *παροξυσμός*, irritation]: Ger. *Paroxismus*; Fr. *paroxysme*; Ital. *parossismo*. A sudden, violent, or spasmodic attack or exacerbation of a disease, or a group of symptoms.

The attacks of epilepsy, of hysteria, of mania, and other mental diseases are frequently of a paroxysmal character. The term

paroxysmal insanity is sometimes applied to a cerebral disturbance, probably epileptic in nature, in which attacks of insanity come on suddenly and are followed by variable intervals of almost normal mental conduct. Cf. EPILEPSY, HYSTERIA, and PERIODICITY. (J.J.)

Parsimony (law of) [Lat. *parsimonia*, frugality]: Ger. *Sparsamkeit*; Fr. *parcimonie*; Ital. *parsimonia*. Ockham's razor, i.e. the maxim 'Entia non sunt multiplicanda praeter necessitatem.' The meaning is, that it is bad scientific method to introduce, at once, independent hypotheses to explain the same facts of observation.

Though the maxim was first put forward by nominalists, its validity must be admitted on all hands, with one limitation; namely, it may happen that there are two theories which, so far as can be seen, without further investigation, seem to account for a certain order of facts. One of these theories has the merit of superior simplicity. The other, though less simple, is on the whole more likely. But this second one cannot be thoroughly tested by a deeper penetration into the facts without doing almost all the work that would be required to test the former. In that case, although it is good scientific method to adopt the simpler hypothesis to guide systematic observations, yet it may be better judgment, in advance of more thorough knowledge, to suppose the more complex hypothesis to be true. For example, I know that men's motives are generally mixed. If, then, I see a man pursuing a line of conduct which apparently might be explained as thoroughly selfish, and yet might be explained as partly selfish and partly benevolent, then, since absolutely selfish characters are somewhat rare, it will be safer for me in my dealings with the man to assume the more complex hypothesis to be true; although were I to undertake an elaborate examination of the question, I ought to begin by ascertaining whether the hypothesis of pure selfishness would quite account for all he does. (C.S.P.)

Part: see WHOLE AND PART.

Parthenogenesis [Gr. *παρθένος*, a virgin, + *γένεσις*, production]: Ger. *Parthenogenese*; Fr. *parthénogénèse*; Ital. *partenogenesi*. Development of a new individual from an ovum which has not been impregnated. It is a special form of asexual reproduction, and has been observed chiefly among arthropods (insects and crustacea). (C.S.M.)

The facts of parthenogenesis have long been

known, and were discussed by Richard Owen, to whom we owe the term. They are illustrated by the male (drone) of the hive bee, which develops from an egg which is not fertilized, but otherwise resembles the eggs from which queens (fertile females) and workers (generally infertile females) are developed. Its origin and its connection with the phenomena of the maturation of the ovum and of the extension of the polar bodies have occupied much attention of recent years. Cf. ALTERNATION OF GENERATIONS, POLAR BODY, and AGAMOGENESIS. (E.S.G.)

The term 'artificial parthenogenesis' has been applied to recent results of artificial fertilization. E. B. Wilson (*Int. Monthly*, July, 1900) describes these results as follows:

'Foremost in interest stands the recent discovery of Loeb that the egg may be fertilized by chemical stimulus, without participation of the male element. The first definite experiments on the effect of chemical solutions on the egg were made by the Hertwig brothers thirteen years ago, and have been continued especially by Herbst, Richard Hertwig, Morgan, and Loeb. The experiments of Herbst, in particular, gave an almost startling revelation of the profound effect upon the egg produced by apparently insignificant alterations in the chemical environment. If, for example, the eggs of sea-urchins be allowed to develop in sea-water containing a very slight excess of potassium chloride, the development of the embryo is greatly altered, no skeleton is formed, and a larva results which, though living and vigorous, is of widely different form from the normal ones. If, in place of potassium chloride, lithium chloride be added to the water, the changes are still more remarkable, the embryo never infolding the cells which normally give rise to the alimentary canal, but developing, as it were, inside out. These monstrous forms are of course incapable of nourishing themselves, and ultimately perish; but the result is of high interest as opening the possibility of creating wholly new organic forms by varying slightly the conditions of development. The way for Loeb's discovery was paved by the experiments of Richard Hertwig and Morgan, who showed that if unfertilized eggs be treated by weak solutions of various substances, such as sodium chloride, magnesium chloride, or strychnine, they undergo some of the preparatory changes of division, and Morgan showed that they might actually divide, though without producing an embryo.

'In experiments carried on at the Woods Holl Biological Laboratory, Loeb finally succeeded in rearing large numbers of perfect larvae from eggs which, without fertilization, are first treated with a weak solution of magnesium chloride and then transferred to normal sea-water. Carried out under rigidly controlled conditions, these decisive experiments show that the egg is capable of complete development, without union with a spermatozoon, as a result of chemical stimulus; and they indicate that even in normal fertilization we must regard the stimulus to development as being given by a specific substance or substances carried by the spermatozoon. Loeb's highly interesting further experiments, together with the slightly earlier ones of Herbst, indicate that the normal equilibrium of the egg depends upon an equilibrium of chemical conditions in the protoplasm which is maintained by the conditions of the environment. The experiments give ground for the remarkable conclusion that the substances dissolved in the sea-water are individually poisonous to the egg, but are normally so balanced as to neutralize one another's injurious effects and maintain the equilibrium of the egg. If this armed neutrality be disturbed the egg responds, undergoing degenerative changes, and dying if the change be too violent, passing through an abnormal development and giving rise to monstrous embryos if the new conditions be less unfavourable, but under appropriate stimulus being, as it were, released from bondage, and rendered free to run its normal course of development.

'It is certain that new results of the highest interest, relating to the chemical conditions in living matter, may be looked for along the lines of research thus opened. One of the most interesting specific problems in this direction is the long-standing one of sex-determination. Experiments on insects, frogs, and rotifers have already given good ground for the conclusion that sex is in these cases determined by conditions of nutrition, which again in the long run are reducible to chemical conditions. The possibility is thus opened that we may yet succeed not only in fertilizing the egg by chemical means, but also in rendering the organism male or female by analogous methods. A highly interesting question, still undetermined, is whether organisms produced by artificial parthenogenesis, as above, are capable of reaching the adult condition and of further reproduction. Individuals thus produced lack the paternal nuclear material,

and must possess but half the normal number of chromosomes. What the ultimate result of this deficiency may be is still a matter of conjecture.'

The statement ventured just above that 'individuals thus produced must possess but half the normal number of chromosomes,' has since been experimentally demonstrated by Wilson (*Proc. N. Y. Acad. Sci.*, 1901). (J.M.B.)

Literature: R. OWEN, Parthenogenesis (1849); A. BRAUER, Zur Kenntniss der Reifung des parthenogenetisch sich entwickelnden Eies von *Artemia Salina*, *Arch. f. mikr. Anat.*, xiii (1893); VON SIEBOLD, Wahre Parthenogenesis (1856); T. H. HUXLEY, On the Agamic Reproduction of *Aphis*, *Trans. Linn. Soc.*, xxii (1858); Y. DELAGE, Structure du Protoplasma, *Biol. Gén.* (1895). (C.L.M.)

Partial [OF. *partial*, borrowed from the L. Lat. *partialis*]: Ger. *partiell*; Fr. *partiel*; Ital. *parziale*. Incomplete, or affecting a part.

Partial abstraction: the abstraction of one integrant part from others.

Partial cause: a cause which is joined with others of its own species in causing that which is caused.

Partial conversion: Aristotle's ἀντιστρέφειν ἐν μέλει is the conversion of a proposition, whether universal or particular, into a particular proposition.

Partial method: a method applying to a part of a science.

Partial term: a term of a proposition, such that not every object it denotes need be examined to verify the proposition (De Morgan, *Syllabus*, § 17). The *Century Dictionary* defines it as an undistributed term, which seems to come to the same thing. (C.S.P.)

Partial Tones: Ger. *Partialtöne*; Fr. *tons partiels*; Ital. *suoni parziali*. The simple constituents of a COMPOUND TONE (q.v.), inclusive of the fundamental. Cf. OVERTONE, and TIMBRE. (E.B.T.)

Particular [Lat. *particularis*, singular]. In untechnical language, applied to single cases coming under general heads and occurring, or supposed to occur, in experience; in this sense it is also a substantive. The particulars are the experientially known circumstances of general nature, but as they appear in the individual case.

A particular PROPOSITION (q.v.) is one which gives a general description of an object and asserts that an object to which that description applies occurs in the universe of discourse, without asserting that it applies to the whole universe or to everything in

the universe of a specified general description; as 'Some dragons breathe fire.' If we hold that the particular proposition asserts the existence of something, then the precise denial of it does not assert the existence of anything; as 'No dragon breathing fire exists.' It is, therefore, not true that from such precise denial any particular proposition follows, such as 'Some dragon does not breathe fire.' For if there is no dragon that does not breathe fire, this is false, although it may be true that there is no dragon that breathes fire. (C.S.P., C.L.F.)

This rule is not, of course, intended to apply to relative logic, in which there is frequently occasion to make a change from one copula to another—a change which is not contemplated in the ordinary logic. For instance, of the two propositions, 'Some woman is adored by every Catholic,' 'Every Catholic adores some woman,' the second follows from the first; to decide whether the first follows from the second or not, some further explicit convention as to the existence of terms which enter the proposition not as simple subject or predicate is necessary. (C.L.F.)

For instance, from the particular proposition, 'Some woman is adored by all Catholics,' it follows that 'Any Catholic that may exist adores a woman,' i.e. 'There is no Catholic that does not adore a woman,' which is the precise denial of 'Some Catholic non-adores all women,' which is a particular proposition. From this, in turn, it follows that a woman adored by all Catholics does not exist, which is the precise denial of the first proposition, 'Some woman is adored by all Catholics.' Of every particular proposition the same thing is true. Thus, if 'Some crow is white,' it follows that 'No inevitable consequence of whiteness is wanting to all crows,' which is the precise denial of the particular proposition, 'Some inevitable consequence of whiteness is wanting to all crows.' Thus, from every particular proposition follows the precise denial of a particular proposition, but from no precise denial of a particular proposition can any particular proposition follow. But this does not extend to a *simple* particular proposition, such as 'Something is white,' since to say 'Something is non-existent' (which the analogous treatment would yield) is an absurdity, and ought not to be considered as a proposition at all. (C.S.P., C.L.F.)

Particulate [Lat. *particulatim*, bit by bit. *Particularis* appears in Apuleius. *Particulatio* is used by Martianus Capella to

mean breaking up into bits. *Particulare* and *particulate* are met with, not very often, in Albertus Magnus and others, to mean to *particularize*, *particularized*, whether in words or metaphysically of an essence]: (not in use in other languages). Particulate is used by recent writers chiefly in the sense of consisting of, or concerned with, particles. They appear to know nothing of the traditions of the word, but to have formed this adjective from *particle*, since *particular* bears a different meaning. (C.S.P.)

Party (in law) [Lat. *pars*, a part]: Ger. *Partei*; Fr. *partie*; Ital. *partito*. (1) A person directly concerned in a lawsuit, either as a plaintiff or a defendant.

(2) A person concerned in any legal transaction, e.g. a *party to a contract*, a party to a question in dispute. *Act of party*, a voluntary act, as distinguished from 'act of law.' Land is conveyed by act of party, inherited by act of law. *Party to the record*, a party to a lawsuit named as such in the written process or pleadings; *party in interest*, one not so named, but who has a beneficial interest in the subject-matter of the litigation. (S.E.B.)

Parva Logicalia [Lat.]. In scholastic logic the departments of that science go by the names of books. Thus, the *logica vetus* embraces what is treated in the 'predicables,' or introduction, of Porphyry, in Aristotle's *Categories*, and in the *Peri hermeneias*; the *logica nova* treats of the remaining subjects of the *Organon*; and finally the *parva logicalia* is the name at once of certain tractates and of the subjects treated in them—to wit, suppositio, relativa, ampliatio, restrictio, appellatio, distributio, exceptivae, reduplicativae, incipit et desinit, alienatio, exponibilia, consequentiae, syncategoremata, insolubilia, copulata, positio propositionum in esse, status, decensus et ascensus, obligationes, &c. (C.S.P.)

Pascal, Blaise. (1623–62.) Born at Clermont in Auvergne, and carefully educated in Paris, he very early developed remarkable abilities as a mathematician. About 1644, he came under the influence of the Jansenists of Port Royal. His attention was fixed chiefly on religion, morals, and philosophy for the remainder of his life.

Passion and Passive [Lat. *passio*, the trans. of Gr. πάθος, from πάσχειν, to suffer]: Ger. *Passivität* (*leidend*, *passiv*); Fr. *passion* (*passif*); Ital. *passività* (*passivo*). Generally passion is the condition of being acted upon, of being affected, receptive; opposed to action. Passive is the corresponding adject-

tive. Technically, it has its philosophical meaning as one of the ten categories of Aristotle (*Topics* and *Categories*). See CATEGORY.

According to the theory of Trendelenburg that the categories correspond to distinctions of language, this category is derived from the passive voice of the verb. In the *Metaphysics* (xiv. 2) Aristotle generalizes the categories under three heads—essences, attributes (*πάθη*), and relations. As attribute, the 'passion' describes what flows not from the essence or substance of the thing itself, but from the way it is acted upon by other things. Thus it comes to mere attribute in general, apart from its passive connotation. Hence the chief importance of the concept historically is in connection with the discussion of the nature of SUBSTANCE (q.v.). Among the Scholastics, the relation of the *passiones entis* to *ens* was a matter of dispute; the Thomists holding that they are real, not simply something attributed to being by thought, and are one in nature with *Ens* itself; while the Scotists hold that they are real, but yet, by the nature of the thing, totally different from *Ens* or being; while others asserted that they were the results of thought. In modern thought the term is practically given up. Cf. AFFECTION, ACCIDENT, MODE, PROPERTY, and QUALITY. (J.D.)

Passion (in psychology): Ger. (1) *Affekt*, (2) *Leidenschaft* (Kant); Fr. *passion*; Ital. *passione*. (1) Strong and uncontrolled emotion.

(2) Strong and uncontrolled emotional disposition; so strong as to exclude or overpower other mental tendencies, and to give rise on occasion to uncontrolled emotions, i.e. to passions in sense (1). Cf. EMOTION, and SENTIMENT.

In sense (1) we speak of 'flying into a passion,' or of a passion of grief. The passion may be due either to general deficiency in the power of self-control, as in the case of children; or to the exceptional violence of emotion which sets self-control at defiance; or to violence combined with a suddenness which does not give time for self-control to be effectively exercised. In sense (2) we speak of carnal passion (though this represents a rather special usage), a 'passion for music,' of passionate devotion to truth, and so on.

Literature: JESSEN, Versuch ü. Psychol., 296 (where the above distinction is made). See the textbooks of psychology generally, and the citations under EMOTION, and SENTIMENT. (G.F.S.—J.M.B.)

Past Time (apprehension of): Ger. (*Bewusstsein der vergangenen Zeit*); Fr. (*connaissance du temps passé*); Ital. (*coscienza del tempo passato*). The time of an event apprehended as having come before the present moment of consciousness.

The series of past events is marked by determinateness and fixity; and especially by the inability of the subject to exercise practical control over it. See TIME (cognition of), also for literature; and cf. PRESENT, and FUTURE.

Earlier writers in general regard the reference of an event to past time as an ultimate and inexplicable fact of consciousness, and connect it with the existence of an ultimate faculty of memory. Herbart was the first to explain it as the result of a complex ideal construction. See Bradley, art. on Memory and Inference, *Mind*, N.S., 30 (April, 1899). Cf. LOCALIZATION (in time). (G.F.S.—J.M.B.)

Pastoral Stage: see SOCIALIZATION.

Pathology (mental) [Gr. *πάθος*, disease, + *λόγος*, discourse]: Ger. *Pathologie* (*des Geistes*), *Psychopathologie*; Fr. *pathologie mentale*; Ital. *patologia (mentale)*, *psicopatologia*. The broadest and in many respects most scientific and suggestive use of the term pathology regards it as coextensive with normal in biology; the latter applies to normal life in all its variety and complexity, the former to that of the morbid, the diseased, and the abnormal in no less extensive and comprehensive a sense.

There would thus be a genetic pathology as there is a genetic biology; anatomy, physiology, psychology, sociology present pathological as well as normal aspects. In medicine, pathology is frequently used in a more specific sense (such use, however, being regarded as unwarranted by many medical writers) to refer to the diseased forms of structure associated with given diseases; this is more precisely termed pathological anatomy. There is a further distinction in medicine between general and special pathology, the disorders of general features of organic life, and of special mechanisms.

The study of the psychological manifestations of disease may be termed mental pathology or psychopathology; it is frequently used as equivalent to the study of seriously abnormal states, and of the conditions which give rise to them. The synonyms Medical Psychology and Psychological Medicine vary somewhat in connotation, and are not free from unfortunate usage. Psychiatry refers to that division of mental pathology which is related to insanity.

Abnormal Psychology is a more general synonym, for the exact scope of which see that term. The science of nerve diseases is called Neuropathology. Cf. the terms referred to.

Literature: the textbooks of mental diseases; special topics, sub verbis; also BIBLIOG. G, i, g; for titles after 1893 consult the Psychological Index, i. ff. (J.J.)

Pathos (1) and (2) **Pathetic** [Gr. *πάθος*, *παθητικός*, passion, feeling]: Ger. *Pathos*, *pathetisch*; Fr. *pathos*, *pathétique*; Ital. *patos* (E.M.), *patetico*. (1) Literally, the more transitory and passive experiences of life, as contrasted with *ethos* (*ἦθος*), the more permanent and active dispositions and character. More definitely, the quality of certain human experiences which present limitation or suffering under such conditions as to evoke not only pity and sympathy, but also aesthetic feeling.

The conditions which are the ground of the aesthetic value seem to be (a) the, in some sense, admirable or pleasing character of the experiences, which show affections, passions of the more contained sort, or hopes and aspirations; (b) the consequent sympathy (cf. HUMOUR), and possibility of recognizing oneself in the experience, (Einfühlung); (c) the contrast, especially as in the favourite Greek situation of the individual in hopeless limitation under laws of destiny. It differs from the tragic as presenting rather a negative or passive than an active collision, and also in that the tragic implies an element of magnitude (according to some, of sublimity), whereas pathos may be found in the small as well as in the great. Hegel used the term to signify the passions as the moving forces of human life, though without the undesirable aspects often implied in the word *Leiden-schaft*.

(2) Having pathos; expressing or evoking passion or tender feeling. A slighter word than pathos, and often used in a depreciatory sense as implying a rhetorical artifice to secure an emotional effect, instead of meaning an actual representation of genuine feeling. This depreciatory sense attaches to the German *pathetisch* (hence *rührend*, moving, touching, is usually employed in its stead) and to the French *pathos*, while the German *Pathos* and the French *pathétique* are used in a good sense. Cf. TRAGIC, and HUMOUR.

Literature: HEGEL, *Werke*, x. 291 ff.; VISCHER, *Aesth.*, i. 265 ff.; KÖSTLIN, *Aesth.*, 17; HARTMANN, *Aesth.*, v. 1 (i); SCHILLER, *Aesth.* and *Philos. Essays*, 'The Pathetic.' (J.H.T.)

Patriarchate [Gr. *πατήρ*, father, + *ἀρχός*,

ruler]: Ger. *Patriarchat*, *Vaterherrschschaft*; Fr. *patriarcat*; Ital. *patriarcato*. A family, clan, or village community ruled by its eldest male, from whom, usually, most of the other males, and half or more of the females, are descended.

This term (or its equivalent in older languages) has been in use from prehistoric times. The Book of Genesis describes the early Hebrew polity as patriarchal. Aristotle (*Politics*) derives all human society from the patriarchal family. The word obtained its modern exact meaning in ethnology and sociology through the controversy between Henry Sumner Maine (*Ancient Law* and *Early Law and Custom*) and J. H. McLennan (*The Patriarchal Theory*). (F.H.G.)

Patristic Philosophy: Ger. *patristische Philosophie*; Fr. *philosophie patristique*; Ital. *filosofia patristica*. (1) The philosophy of the Christian era falls readily into three periods, commonly designated as patristic, scholastic, and modern. The patristic philosophy, in its broadest acceptance, is contemporaneous with the rise of Christianity, and extends to the death of Gregory the Great in the West (604) and of John Damascene in the East (755).

(1) In reality the patristic movement spent itself much earlier, with Augustine (d. 430) and Cyril of Alexandria (d. 444) as its culminating spokesmen. An epoch of encyclopedism, in which a number of writers (Capella to Alcuin, 430-804) stand out rather as depositaries of secular and Christian learning than as originators of new lines of thought, marks the decline of patristic philosophy and the transition to the scholastic movement, which starts with Erigena in the first half of the 9th century.

Literature (to 1): besides the general works on the history of philosophy of UEBERWEG, HAFNER, ERDMANN, and WINDELBAND, which treat this period incompletely and not always with accuracy, the following bibliography embodies a fuller presentation of the patristic field. MÖHLER, *Patrologie* (Regensburg, 1840); RITTER, *Christl. Philos.* (Hamburg, 1841; Göttingen, 1858-9); FESSLER, *Instit. Patrologiae* (2 vols., to Gregory the Great; Innsbruck, 1850-1, 1890-2); NEANDER, *Christl. Dogmengeschichte* (Berlin, 1851); STÖCKL, *Gesch. d. Philos. d. patristischen Zeit* (Würzburg, 1859); *Gesch. d. christl. Philos. z. Zeit d. Kirchenväter* (Mainz, 1891); HUBER, *Die Philos. d. Kirchenväter* (Munich, 1859); W. MÖLLER, *Gesch. d. Kosmologie in d. griechischen Kirche bis auf Origenes* (Halle, 1860); WERNER, *Gesch. d. apologetischen*

u. polemischen Litteratur d. christl. Theol. (Schaffhausen, 1861); DONALDSON, A Critical History of Christian Literature and Doctrine (3 vols., London, 1865-6); ALZOG, Grundriss d. Patrologie (Freiburg, 1866-88); NIRSCHL, Lehrb. d. Patrologie u. Patristik (3 vols., Mainz, 1881-3-5); SCHWANE, Dogmengeschichte der vor-nicaenischen Zeit; der patr. Zeit (Münster, 1862-9); HARNACK, Lehrb. d. Dogmengeschichte (Freiburg i. B., 1890); Gesch. d. altchristl. Litteratur, bis Eusebius, Pt. I (Leipzig, 1893 ff.).

The intrusion of the personal equation and of pre-accepted theories colours the interpretations of most writers on this period. The necessity, therefore, of criticizing one's categories and of avoiding too much simplification and condensation in one's reconstructive analyses should be borne in mind during a study of the above bibliography. To form an objective estimate of the patristic writings, disinterested textual study is indispensable. See BIBLIOG. A, i, d, and A, 2, sub nomen.

(2) Christianity as a new and distinct religious principle struggled from the beginning against both Jewish and Gentile efforts to absorb its doctrinal and ethical content. Confronted by the aristocratic separatism of the paganizing Gnostics on the one hand, and by the racial exclusiveness of the Jews on the other, Christianity had soon perforce to determine its relations to the Judaic and pagan past, and to assume a definite attitude towards the complex philosophic problems to which, indirectly at least, it had given rise. The necessity of thus setting forth its position against Jews and Greeks, Gnostics and Neo-Platonists, Judaizers and heretics, quite naturally at first with the Apostolic Fathers took the form of letters in which the theoretical and practical content of Christianity is exposed and defended. Quite naturally at first also we meet a period of Apology negative in character as regards the reigning philosophies, and intent only on showing forth the Christian faith as the sole true philosophy, and for this reason worthy of credence and undeserving of persecution. The three great struggles of early Christianity against the ethical, religious, and sectarian bias of the pagan world, thus gave a moral, apologetic, and polemic character to the Christian literature of the first three centuries. To its contest with the rejuvenated theories of the earlier Eastern religions, patristic philosophy owes its spur to systematic development. See GNOSIS.

Literature (to 2): the following works

present a full view of the Gnostic and Neo-Platonic tenets: NEANDER, Genetische Entwicklung d. vornehmsten gnostischen Syst. (Berlin, 1818; Eng. trans. by Torrey, Boston, 1865); MATTER, Hist. critique du Gnosticisme (Paris, 1828-43); MÖHLER, Ursprung d. Gnosticismus (Tübingen, 1831); FRANCK, Syst. de Kabbale (Paris, 1842); KIRCHENER, Die Philos. d. Plotin (Halle, 1854); RICHTER, Neuplatonische Stud. (Halle, 1864-7); HOLZMANN, Judenthum u. Christenthum (Leipzig, 1867); MANSEL, The Gnostic Heresies (London, 1875); OVERBECK, Ueber die Anfänge d. patristischen Litteratur, Hist. Zeitsch. (1882); DRUMMOND, Philo-Judaeus, or the Jewish Alexandrian Philos. in its Devel. and Completion (2 vols., London, 1888); ZELLER, Die Philos. d. Griechen, 3. Theil, 2. Abth., 419-865 (3rd ed., Leipzig, 1881). In SCHAFF'S History of the Christian Church (i. 221-51), Gnosticism receives full treatment, and in the Encyc. Brit., art. Neo-Platonism, the exposition of this subject by HARNACK may be consulted.

(3) The apologetic of the Apostolic Fathers soon lost its negative character as regards the reigning philosophies. After the efforts of the Gnostics to construct a philosophy of Christianity and to square faith (*πίστις*) with knowledge (*γνῶσις*) by means of fanciful world-views had abutted on failure and resulted only in divers systems of theosophy and mysticism, a double reaction took place. Some minds, looking upon the Gnostic failure as a clear indication of the worthlessness of all philosophy not Christian, and as a decisive forecast of the final outcome of all attempts to reconcile Christian with pagan thought, were more or less hostile to the introduction of the rational element into the Christian mental life. Others favoured a renewed effort at reconciliation, and set themselves to the task accordingly. And thus the necessity of determining the points of contact between Christian doctrine and Hellenic culture divides the thought of the first four centuries into two schools—the African and the Alexandrian—according to the respective attitudes of hostility or friendliness assumed towards the incorporation of pagan philosophy.

The usual partition of patristic philosophy into the Ante-Nicene and the Post-Nicene periods—the former characterized as a period of *genesis*, the latter as a period of *elaboration*, of the dogmas defined by the Council of Nice (325)—has the faulty feature of not bringing out with distinctness the formative

lines of thought. A more philosophical division is the Rise (period of Apostolic Fathers, extending to 150 A. D.), Development (period of Apologists, 150-325), Culmination (from Council of Nice, 325, to St. Augustine's death, 430), and Decline (period of Encyclopedists, 430-804). In this division the African and Alexandrian schools, the latter especially, receive historical setting as factors of development. A usual subdivision—that of the Antiochian school, which adopted an attitude midway between the Alexandrian and the African—has significance rather for the history of theology than of philosophy.

(4) The African school, so designated because the spirit of hostility to pagan philosophy manifest in the Apologetic writings reached its fullest expression in Tertullian and Arnobius, both Africans, may be said to include all the earlier Apologists with the noteworthy exceptions of Justin and Athenagoras.

Tatian, in his *λόγος πρὸς Ἕλληνας* (160-70 A. D.); Theophilus of Antioch, in his work *πρὸς Αυτόλυκον* (cir. 182); Hermias, in his *διασπυρμός τῶν ἔξω φιλοσόφων* (after 200); Irenaeus, in his *ἐλεγχος καὶ ἀνατροπὴ τῆς ψευδωνύμου γνώσεως* (cir. 180), and Hippolytus, in his *ἐλεγχος κατὰ πασῶν αἵρέσεων* (223-35), oppose all rapprochement of Christian thought with pagan wisdom, and hold the philosophy of the Greeks in high disfavour, the attitude of Tatian and Hermias amounting to supreme contempt. This anti-synthetic tendency received its most classical expression in the works of Tertullian, Minucius Felix, Arnobius, and Lactantius. (a) Tertullian, presbyter of Carthage (160-220), a lawyer previous to his conversion (197), and afterwards a Montanist (202), is outspoken in his denunciation of all philosophers, whether of the Academy or the Porch: the true Porch is that of Solomon, and the Greek philosophers are the patriarchs of the heretics. Christ and the Gospel have made all further inquiry futile. In his celebrated formula 'Credo quia impossibile' (*De Carne Christi*, cap. v) he gives trenchant expression to his views. Windelband and many critics, on the strength of this passage, classify him as anti-rational. But a more careful study of his works (*De fuga in persecutione*, cap. iv; *De Baptismo*, cap. ii; *Apologet.*, cap. xvi; and the *Testimonium Animae*, in its entirety) furnishes a better focus for determining his standpoint than the above detached formula, which, in the light of the several passages indicated, reduces itself to an extravagant burst of oratory and an

argumentum ad hominem. A more critical estimate, while still leaving him violently opposed to the encumbrances of pagan philosophy, would not go the length of making him out anti-rational. (For a good textual study on this point, see *La Revue Catholique*, i. 485 ff., 1869; *Étude philos. sur Tertullien*, Laforêt.) His chief works of philosophic relevancy are: *Adversus Marcionem* and *Adversus Praxeam*, for theodicy; *De Anima*, *De Resurr. Carnis*, *De Carne Christi*, for anthropology and psychology; *Adversus Marcionem*, *Adversus Iudaeos*, *De Monogamia*, *De Pudicitia*, *De Ieiunio*, *De Resurr. Carnis*, for ethics. The brief *résumé* of his doctrine furnished by Ueberweg (i. Pt. II. 303-6, Eng. trans., N. Y., 1894) is inaccurate (304) in ascribing to him a belief in the total depravity of the human mind and will (see Laforêt, loc. cit.). (b) Minucius Felix, who lived towards the end of the 2nd century, expresses in his *Octavius* many ideas suggestive of Tertullian. He opposes the polytheism of the popular faith in a graceful portrayal of the divine Omnipresence, and ascribes rather to plagiarism from the Old Testament than to native ability in reasoning whatever speculative truth is to be found in the systems of Plato and Pythagoras. (c) Arnobius, in his work *Adversus Gentes* (after 300), develops more fully the thesis of Felix. His low estimate of the powers of human reason may be gathered from his statement, made in refutation of Platonic pre-existence, that a man isolated from birth would acquire no knowledge transcending sense, and show no signs of intellect. (d) Lactantius, the Christian Cicero and contemporary of Arnobius, devotes the third book of his *Institutiones Divinae* to proving the nullity of all philosophy. Revelation alone leads to truth. Less hostile than Tertullian, he admits that the fragments of truth scattered through the pagan schools would, if pieced together, yield an organic body of doctrine in accord with Christian faith, but proclaims the impossibility of such an eclectic piece of work without divine aid and teaching. His other extant works of import are: *Liber de opificio Dei*, *De ira Dei liber*, *De mortibus persecutorum*.

Justin and Athenagoras did not share these extremist views as to the depravity of pagan philosophy. Justin, who died about 166, is the first Apologist whose works have come down to us. In his first Apology (*ἀπολογία πρώτη ὑπὲρ τῶν Χριστιανῶν*, 147) and in his second (*πρὸς τὴν Ῥωμαίων σύγκλητον*, about 150)

he shows friendliness to Greek philosophic endeavour. The divine Logos illumined the Greeks, enabling them in a measure to see the truth, which exists wholly and completely in the incarnate wisdom, Christ. His *διάλογος πρὸς Τρυφῶνα Ἰουδαίου*, besides a vindication of the divinity of the Logos, contains his eschatological views. The *Exhortation to the Greeks* (*λόγος παραινετικός πρὸς Ἕλληνας*), of doubtful authenticity, asserts Greek familiarity with Old Testament writings, and repudiates the Greek myths respecting the Deity. Athenagoras, in his *Apology* (*πρεσβεία περὶ τῶν Χριστιανῶν*, 176-7) addressed to Marcus Aurelius, defends the Christians against the threefold charge of atheism, immorality, and Thyestian feasts, exposes the Christian conception of God, and quotes the Greek poets and philosophers in favour of monotheism. In his *Resurrection of the Dead* (*περὶ ἀναστάσεως τῶν νεκρῶν*) there is a good portrayal of patristic anthropology too often overlooked. Athenagoras is a pleasing, cultured, and methodical writer. His *Apology* (chaps. viii, ix) contains an original *a priori* proof for the existence of God.

Literature (to 3 and 4): the reconstruction of this period will be greatly facilitated by a critical use of the following special works, in addition to those already enumerated: Les Apologistes chrétiens au second siècle (Paris, 3rd ed., 1888); DANIEL, Tatian d. Apologet (Halle, 1837); BÖHRINGER, Die Kirche Christi, &c., Irenaeus, 271 ff. (Zürich, 1861); VOLKMAR, Hippolytus u. die römischen Zeitgenossen (Zürich, 1855); AUBÉ, Saint Justin, martyr et philosophe (Paris, 1881); GILDER-SLEEVE, The Apologies of Justin Martyr, &c. (N. Y., 1877); SCHUBRUNG, Die Philos. d. Athenagoras (Berlin, 1882); LAFORÊT, Rev. Catholique, Athénagore, &c., ii. 198-215 (1871); DE FELICE, Étude sur l'Octavien de Minucius Félix (Blois, 1880); cf. also Jahrb. f. prot. Theol., 485-506 (1881), 168-78 (1882); J. des Savants, 436-53 (Paris, 1883); GEBHARDT, HARNACK, Opera Patrum Apostolicorum (Leipzig, 1876-7); FUNK, Doctrina Patrum Apostolicorum (2 vols., Tübingen, 1881-8); RÖHRICHT, Seelenlehre d. Arnobius (Hamburg, 1893); STEUER, Die Gottes- und Logoslehre des Tatian (Leipzig, 1893); WERNER, Der Paulinismus des Irenäus (Leipzig, 1889); KUNZE, Gotteslehre des Irenäus (Leipzig, 1891); KÜHN, Der Octav. des Min. Felix (Leipzig, 1882); cf. Theol. Litterar-Zeitung (No. 6, 1883).

(5) Thus the greater part of the Apologists

held aloof from any synthetic attitude towards Greco-Roman philosophy, emphasizing spontaneous belief rather than rational investigation, and setting forth the Christian ethics as well as the ideas of God, personality, and immortality in sharp and distinctive contrast with the corresponding pagan notions. The underlying *motif* with all the Apologists was a rational justification of divine Providence. The African school sought its proofs in the utter ineffectiveness of Greek philosophy; the Alexandrian, influenced by the larger view that God was the source of natural as well as of revealed truth, regarded Greek philosophy as a preparatory introduction to Christianity.

The Alexandrian school, which succeeded to the conciliatory spirit of Justin and Athenagoras, deserves the credit of having imparted a new and vigorous impulse to the entire patristic movement, along the neglected lines of incorporation and synthesis. Founded by Pantaenus about 180 A. D., it was throughout as friendly to the rationalizing spirit as the African school was hostile. (a) Clement of Alexandria (150-220) states in his *Stromata* that philosophy is twofold—the Christian, which proceeds directly from God, and the Greek, which comes indirectly through human reason from the same source. Philosophy was a sort of Testament to the Greeks, as the law to the Hebrews, both being preparations for Christianity. Sharing the views of Justin, he limits the faultiness of Greek philosophy to its partial, incomplete truths, and recommends a criterion (agreement with Christian belief) whereby the true may be sifted from the false in Hellenic science; likening those who would dispense with dialectic in theology to ‘a man who would fain gather grapes without cultivating the vine.’ The Christian should advance from faith to knowledge. Faith is not blind, reason not all-sufficing. The true Gnostic is the Christian Gnostic, such as St. James, St. Paul, and St. John, illumined by the Logos and ever acting from love. An eclectic, adhering to no school in particular, he developed two noteworthy ideas—the Christian Gnosis and the Christian criterion. The *Stromata* of Clement embodies the first rough attempt at a systematic Christian philosophy. His works of importance are: the *Stromata*, for the Gnosis; *Paedagogus*, for ethics; and the *Λόγος προτρεπτικός πρὸς Ἕλληνας*, against the absurdities of Paganism. (b) Origen (185-254), a disciple of Clement, pieced together into an orderly whole the fragmentary teaching

of his master. While denying the identity of pagan thought and Christian revelation, he endeavoured to effect their union by rejecting 'only the captious ignorance of the philosophers.' In his method of presenting Christian doctrine, he anticipates the Schoolmen. He admitted an indefinite series of worlds, and denied all fixity of reward or punishment. He was the first to formulate the distinction *παρὰ φύσιν* and *ὑπὲρ τὴν φύσιν* (*Contra Celsum*, v. 23, 24). His deep reading in Philo gave him an extravagant sense of the allegorical which he applied to the interpretation of Scripture. His chief works are the *Stromata*, *Contra Celsum*, and *De Principiis*.

Literature (to 5): the literature bearing on the Alexandrian school is abundant. The following treat the subject-matter at length: VACHEROT, *Hist. critique de l'école d'Alexandrie* (3 vols., Paris, 1846-51); SIMON, *Hist. de l'École d'Alexandrie* (2 vols., Paris, 1844-5); MATTER, *Sur l'École d'Alexandrie* (Paris, 1840-8); DE FAYE, *Clément d'Alexandrie* (Paris, 1898); FREPPEL, *Clément d'Alexandrie* (Paris, 1866); MERK, *Clemens Alex. in seiner Abhängigkeit v. d. griechischen Philos.* (Leipzig, 1879); REDEPENNING, *Origenes, sein Leben u. seine Lehre* (2 vols., Bonn, 1841). A good study of Origen's philosophy by LAFORÊT may be found in the *Revue Catholique*, i. 685-705; ii. 123-39, 255-73, 545-72 (1870). REVILLE, *Le Logos d'après Philon d'Alex.* (Geneva, 1877); DENIS, *De la Philos. d'Origène* (Paris, 1884).

(6) The Alexandrian school fixed the synthetic tendency in Christian thought. It introduced the Platonic element, to which the Aristotelic (by Philoponus, who wrote 500-70) and the Neo-Platonic (by Augustine and Dionysius the Areopagite) were also added in the course of the struggle against heresy and in the repeated endeavours to express the Christian dogmas in terms of reason.

In the period of culmination we meet the names of Eusebius (d. 340), Athanasius (d. 373), Basil (d. 379), Gregory of Nazianzen (d. 390), Gregory of Nyssa (d. 395), Cyril of Alexandria (d. 444), Augustine (354-430), Nemesius (wrote 400-50), and Dionysius the Areopagite. We treat only those who have special significance for the development of philosophy. (a) Gregory of Nyssa, in his *Dialogue with his sister Macrina concerning the Resurrection*, shows the first clear attempt at a parting of the ways between philosophy and theology—a problem which did not become fully actual until the 13th century. In his

Λόγος κατηχητικός the presentation of Christian doctrine is far more orderly and thorough than that of Origen. His disquisitions on creation show freshness and originality. In his discussion of the Trinity he anticipates the mediaeval difficulties attending the application of dialectic to theology. His introduction of the philosophic and scientific elements into the exposition of Christian doctrine marks an advance over Clement and Origen. His anthropology is contained in his work on creation, and his eschatology in the above-mentioned dialogue. (b) Saint Augustine, the master mind of patristic philosophy, was born at Tagaste, 354, and died bishop of Hippo Regius, 430. The philosophic element, prominent throughout all his writings, is to be found more especially in the following works, which serve as a basis for the reconstruction of his views: *Contra Academicos* (386), *De Beata Vita* (386), *De Ordine* (386), *Soliloquia* (387), *De Immortalitate Animae* (387), all composed before his baptism; *De Quantitate Animae* (388), *De Utilitate credendi* (391), *De Duabus Animabus contra Manichaeos* (391), *De Libero Arbitrio* (388-95), *Confessiones* (400), *De Genesi ad Litteram* (401-15), *De Trinitate* (400-16), *De Anima et eius origine* (419), *De Civitate Dei* (413-26), and the *Retractationes* (427). In the *Retractationes* Augustine reviews his entire writings, and withdraws many of his previous opinions.

Philosophy, with St. Augustine, is a diligent inquiry into things human and divine, in so far as conducive to blessedness of life. Though good in itself, philosophy cannot direct man to salvation, and is therefore inferior to Christian truth. Whether moral, rational, or natural, its object is the soul and God—no more, no less. Its methods are authority and reason. Authority and faith precede all scientific investigation and reflex knowledge. Faith is superior to letters and philosophy, although nourished and strengthened by both. The Neo-Platonists approached nearest to speculative Christian truth, but were ashamed to leave the school of Plato for that of the fishermen. To combat scepticism, St. Augustine proceeded along lines anticipatively Cartesian—the impossibility of doubting one's own existence, and the implication of the fact of one's existence in the very possibility of one's being deceived. Thought and the existence of the thinker are the most certain of all things. Intellect is the true constituent of science. Sense-perceptions are true in them-

selves, but their content may be misinterpreted by reason. The soul is a substantial, spiritual, immortal principle of knowing, willing, and remembering. Its immediate creation is a matter not to be pronounced upon, because of the existence and transmission of original sin. God is One—the container of all intelligible truth, and of Plato's world of archetypal ideas. He is known rather as surpassing all categories than as expressible in them. He is the Creator, Upholder, Provider, and Predestiner. He is not the author of evil, which is only a privation of good brought about by free and defectible creatures. Evil has only a deficient, not an efficient cause; whence the absurdity of Manichaeism. God is Triune; and his trinal personality as well as substantial unity may be feebly understood from the analogy of memory, thought, and love in the human soul. The first man fell from his high estate. Original sin, which is a privation of original justice, affected the entire race and weakened man's power of will. After establishing the freedom of the will ('De libero Arbitrio,' throughout), St. Augustine reduces it to the vanishing point in his Pelagianic controversies and in nearly all his later works (Nourrisson, *Philos. de Saint-Augustin*, i. 413–83), because of his attempt to reconcile its admission with the doctrines of Grace and Predestination. In the work *De Civitate Dei* the history of the Israelites and of the divine Commonwealth is set forth as a basis for the true philosophy of history. In harmonizing the various thought-tendencies of his day and of antecedent times; in imparting to patristic philosophy its first relatively complete systematic development; in attempting a definite parting of the ways between philosophy and theology; in his fruitful refutation of academic doubt; and in his vigorous outline of a philosophy of history, St. Augustine is the leading figure of patristic thought and the teacher of the middle ages. The sources upon which he drew for information were naturally Greek and Latin. He had considerable knowledge of Plato, notably of the *Timaeus*, and adopted Plato's theory of ideas. But the Platonism upon which he drew was the Alexandrian Neo-Platonism of Plotinus, Porphyry, and Iamblichus, gathered from the translations of the rhetorician Victorinus, and not from original documents. His defective knowledge of Greek, and his exclusive study of Plato in the Neo-Platonic writings above mentioned, led him to group Plato and Aristotle, Academicians and Peripatetics, Platonists and Neo-Platonists con-

fusedly together, without so much as a suspicion of their divergent view-points. This lack of acquaintance with original sources accounts for the extravagant estimate which he entertained of Neo-Platonism; it accounts also for his inaccurate portrayal of Gnosticism and Manichaeism in particular, and of the Eastern religions in general. His knowledge of the Greek Fathers was obtained through the Antiochian school, whose methods, views, and arguments respecting the explanation of the Trinity he repeats with a striking similarity that is indicative of the fusion of Greek and Latin thought-currents (Régnon, *Études de Théol. positive sur la Sainte Trinité*, iii. 142 ff., 1898). Besides this indirect conversance with Hellenic science, St. Augustine was greatly indebted to Latin thought for much of his knowledge. Vergil, Lucretius, Horace, Terence, Persius, and Juvenal among the poets; Cicero, Seneca, Appuleius, Varro, and Aulus Gellius among the prose writers, were drawn upon extensively. Of the Latin Fathers, Tertullian, Lactantius, and Ambrose were chiefly instrumental in his formation; not to mention the crowning influence of all, which was that of the Scripture, and especially of St. Paul's writings.

Literature (to 6, St. Augustine): a good critical study of St. Augustine is NOURRISSON, *Philos. de Saint-Augustin* (2 vols., Paris, 1865). Consult also: BINDEMANN, *Der heilige Augustinus* (3 vols., i. Berlin, 1844; ii. Leipzig, 1856; iii. Greifswald, 1869); DUPONT, *La Philos. de Saint-Augustin* (Louvain, 1881); STORZ, *Die Philos. des hl. Augustinus* (Freiburg, 1882). For special studies see LÖSCHE, *De Augustino plotinizante in doctrina de Deo disserenda* (a dissertation of 68 pages; Jena, 1880); FERRAZ, *La Psychol. de Saint-Augustin* (Paris, 1863); PRANTL, *Gesch. d. Logik, &c.*, i. 665–72 (Leipzig, 1855; treats the logic of Augustine); and MERTEN, *Ueber die Bedeutung d. Erkenntnisslehre des hl. Augustinus, &c.* (Treves, 1865; his theory of cognition); SIEBECK, *Gesch. d. Psychol.*, I, 2, 358–401 (Gotha, 1884); REINKENS, *Geschichtsphilos. d. hl. Augustinus* (Schaffhausen, 1866).

(c) Nemesius (who wrote 400–50) devoted himself chiefly to a work entitled *De Natura Hominis*. It is a treatise on psychology, asserting free will and immortality, and represents an attempt to combine Plato and Aristotle. (d) In the works attributed to Dionysius the Areopagite (*De Divinis Nominibus*, *De Hierarchia caelesti*, *De Hierarchia ecclesiastica*,

not written earlier than 451), the introduction of the Neo-Platonic element into Christian thought was sealed. Distinguishing between affirmative theology which descends from God to the world, and abstractive theology which ascends from the world to God, the author develops the idea of the utter transcendence of the Deity. These writings show traces of Iamblichus and Proclus, and exercised great influence, especially with the mystics, in the middle ages. They were commented by Maximus Confessor in the 7th, and made known to the West by Scotus Erigena in the 9th century.

Literature (to 6 c): **HIPLER**, Dionysius d. Areopagit (Regensburg, 1861); **LAFORET**, Denys l'Aréopagite, Rev. Cathol. (1871), 364-97; **COLET**, Two Treatises on the Hierarchies of Dionysius, with trans., introd., and notes by J. H. Lupton (London, 1869).

(7) The endeavour to effect a conciliatory synthesis of faith and reason, which characterizes Christian thought in this earlier patristic stage, takes on the successive forms: (a) of logical classification of material (430-1050); (b) of reflex criticism (1050-1200); and (c) of organic completion (1200-1453), in the later stage of development brought about by the Schoolmen. See **SCHOLASTICISM**. (E.T.S.)

Patristics [Lat. *pater*, father]: Ger. *Patristik*; Fr. *patristique*; Ital. *dottrina patristica*. The critical and systematic study of the doctrines and writings of the fathers of the Christian Church.

Patristics covers the early period of Christianity from the Apostolic Fathers down to the time of the schism between the eastern and western branches of the Church when the construction and movement in theology came to a temporary close. The works of the fathers have been collected and edited by Migne, and more critically studied by Harnack and his associates. Cf. **PATRISTIC PHILOSOPHY**.

Literature: **MIGNE**, *Patrology*; **HARNACK**, *Lehrb. d. Dogmengeschichte* (2nd ed., 1888-90); **SMITH** and **WACE**, *Dict. of Christ. Biog.* (1880-6); **DONALDSON**, *Crit. Hist. of Christ. Lit. and Doctrine* (1864-6). See full lists under the various sections of the topic **PATRISTIC PHILOSOPHY**. (A.T.O.)

Patritius, Franciscus (Patrizzi, Francesco). (1529-93.) Educated in Venice and in Padua, where he attended lectures on Aristotle (1546). Travelled in Spain. Professor of Platonic philosophy in Ferrara, 1570-90. Opposed to Aristotle as a result of his study

at Padua, and of his intercourse with Selesius and the Neo-Platonists. He wrote on poetics and theology as well as philosophy.

Patronymic [Gr. *πατρωνυμικός*]: Ger. *patronymisch*; Fr. *patronymique*; Ital. *patronimico*. A name derived from the name or description of the father or other male ancestor.

The correlative of **METRONYMIC** (q.v.), and having a parallel history. (F.H.G.)

Peace (in law) [Lat. *pax*, through Fr.]: Ger. *Friede*; Fr. *paix*; Ital. *pace*. (1) The condition of a state which is not at war, with respect to its foreign relations.

(2) The condition of a state relatively to another state with which it is not at war.

(3) The internal tranquillity which is the normal condition of a state with respect to its inhabitants.

Against the peace: that which violates this tranquillity. *In the peace*: the condition of one who is not violating it. *Sureties of the peace*: sureties exacted from those threatening to violate it, that they will *keep the peace*. *The King's peace*: the ancient expression by which English law denoted that immunity from acts of violence which was due to the sovereign, his household, court, and officers of government, and which was gradually extended to all within the realm, save outlaws. (S.E.B.)

Peccability and Impeccability [Lat. *peccabilis*, liable to sin]: Ger. *Sündhaftigkeit*; Fr. *peccabilité*; Ital. *peccabilità*. Terms used in theology to indicate not actual sinfulness or the opposite, but a state of liability or non-liability to sin. The commission of sin is not one of the contingencies of an impeccable nature.

The question has arisen (1) with reference to the human nature of Christ. All Christians agree as to his actual sinlessness; but some have held that while in his synthetic nature he is free from the liability to sin, yet that in his human nature he was liable to sin, although actually sinless. (2) With reference to the Virgin Mary, the doctrine of the Immaculate Conception involving her subsequent impeccability. This the majority of Protestants do not admit. (3) With respect to the saints. The majority of Christians deny the impeccability of any mortal this side of the grave. But the advocates of perfectionism hold a doctrine of relative impeccability.

Literature: see **SIN**, and **PERFECTIONISM**. (A.T.O.)

Pedagogical Psychology: Ger. *päda-*

gogische Psychologie; Fr. *psychologie pédagogique*; Ital. *psicologia pedagogica*. Psychology applied to the science and practice of education.

Literature: see under PEDAGOGICS. (J.M.B.)

Pedagogics [Gr. *παιδαγωγία*, the training or guiding of boys]: Ger. *Pädagogik*; Fr. *pédagogie*; Ital. *pedagogia*. The theory and art of teaching as a profession, involving the scientific application of the sciences of mind, body, and society, to the work of education.

Since pedagogics is an applied science, depending upon civilization for its ends, and upon psychology for its methods, it is natural, first, that different nations and different stages of civilization should vary in their ideals of the purposes of education; and second, that psychologists should vary in their method of approach to the study of educational problems according to their several ways of studying the mind. The main problems in pedagogics pertain (a) to the construction of the curriculum; (b) to the methods of teaching; (c) to the development of character.

There are three chief standpoints from which these problems are viewed: (1) The *a priori* method, which, following the lead of rational psychology, considers the necessary constitutive elements of the mind, the character and the institutions of civilization (see Rosenkranz, *Philos. of Educ.*); (2) the *a posteriori* method, which, ignoring largely the *a priori* aspects of mind and society, gives its main attention to the content of the studies and the processes of the mind (see Herbart, *Sci. of Educ.*); (3) the method of child study, or actual observation of children. It is evident that a complete pedagogics must take all these varying methods of approach into consideration, since each emphasizes important aspects of the ends and methods of education.

Literature: ROSENKRANZ, *Philos. of Educ.*; HERBART, *Sci. of Educ.* (Eng. trans.); PARKER, *Talks on Pedagogics*; HARRIS, *Psychol. Foundations of Educ.*; FROEBEL, *Educ. of Man*; BAIN, *Educ. as a Science*; REIN, *Outlines of Pedagogics*; A. ANGIULLI, *La Pedagogia* (1882); R. ARDIGÒ, *La Scienza dell' Educazione* (1893). (C. De G.)

Pedagogy: see PEDAGOGICS.

Peduncle [Lat. *pedunculus*, a stalk]: Ger. *Schenkel*; Fr. *pédoncule*; Ital. *peduncolo*. In brain anatomy: a stalk-like fibrous body serving to connect a massive organ, such as the cerebrum or cerebellum, with the rest of the brain. Cf. BRAIN (Glossary). (H.H.)

Pelagianism: Ger. *Pelagianismus*; Fr. *pélagianisme*; Ital. *pelagianismo*. The doctrine of Pelagius. A system of theological anthropology which in the maintenance of its central doctrine of man's free and responsible agency is led to deny the original sinfulness of man's nature and the transmission of the effects of Adam's transgression, and to assert the opposite doctrines of man's natural sinlessness and his ability, without divine interposition, to take the initiative in his own salvation, thus limiting the function of the Holy Spirit to that of assistance to the human will.

Pelagianism arose historically as a reaction against AUGUSTINIANISM (q.v.), which asserts the inability of the human will and the necessary initiative of the Holy Spirit in man's regeneration and salvation. As a religious doctrine Pelagianism is less profound than the doctrine it opposes, inasmuch as the divine agency is necessarily the point of supreme emphasis in religion. Augustinianism represents a deeper insight, and is more profoundly religious than the opposing system. From the ethical point of view, as distinguished from the religious, Pelagianism seems to derive most of its strength. It is a system of ethical individualism, and its persistence in the form of semi-Pelagianism seems to indicate that it embodies an insight that needs to be conserved. Perhaps the one-sided assertion of Augustinianism would lead to a too extreme self-abdication on the part of the human spirit. On the other hand, the radical weakness of Pelagianism as a religious doctrine lies in its virtual denial of the prime necessity of divine grace and the limitation of the Spirit of God to a subordinate function in the regeneration of man. See PATRISTIC PHILOSOPHY.

Literature: ST. AUGUSTINE, *Anti-Pelagian Writings* (Eng. trans., N. Y., 1847); F. WIGGINS, *Versuch einer pragmatischen Darstellung des Augustinianismus u. Pelagianismus* (1831-3; Eng. trans., 1840); *Encyc. Brit. and Johnson's Encyc.*, art. Pelagianism; SHEDD, *Hist. of Christ. Doctrine* (1863); F. WÜRTER, *Der Pelagianismus* (1866). (A.T.O.)

Pelagius. (cir. 370.) Not heard of after 418. Probably a Briton. He went to Rome about 400, and sought to check the degenerate tendencies of the city. He was simply a layman. Moved to North Africa about 409. He was later known to be in Palestine. The principal works of Pelagius were by mistake attributed to Jerome. See PELAGIANISM.

Penal: see CRIMINAL (in law), PENOLOGY, and REWARD AND PUNISHMENT.

Penal Code: see CODE.

Penance [Lat. *paenitentia*, repentance]: Ger. *Busse*; Fr. *pénitence*; Ital. *penitenza*. In Roman Catholic theology, the atonement which one who has committed post-baptismal sin makes for it by repentance, amendment, and the performances of expiatory works; or the Sacrament in which pardon, on the fulfilment of the requisite conditions, is formally granted.

Penance is a central feature of the practice of the Romish Church. The theory on which it rests is ordinarily rejected by Protestants as savouring too much of Pelagianism. The Sacrament of Penance is closely associated with the practice of auricular confession which arose in connection with it.

Literature: BINGHAM, *Christ. Antiq.* (Oxford, 1855); HAGENBACH, *Hist. of Doctrines*; CRAMP, *Textbook of Popery*; PROBST, *Sakramente u. Sakramentalien* (1872). (A.T.O.)

Pendulum: see LABORATORY AND APPARATUS, III, B, (b).

Penitence [Lat. *paenitentia*, repentance]: Ger. *Reue*; Fr. *pénitence*; Ital. *penitenza*. In general usage employed as a synonym for repentance, but more strictly, either as the equivalent of penance or as a name for the state of mind produced by the act of repentance. (A.T.O.)

Penology [Lat. *poena*; Gr. *ποινή*, penalty, + *λόγος*, discourse]: Ger. *Strafenlehre*; Fr. *théorie des peines*; Ital. *teoria della pena, penologia*. 'The study of punishment for crime, both in its deterrent and in its reformatory aspect; (including) the study of the management of prisons' (*Cent. Dict.*).

The term and the study it describes are of recent origin. The definition quoted is made exact by inserting the word 'including.' Penology has obtained vogue chiefly through the Howard Association of England and the National Prison Association of the United States. The literature of CRIMINOLOGY (q.v.) includes many works on penology, and courses on the subject are given in many universities. Cf. REWARD AND PUNISHMENT, and SANCTION. (F.H.G.)

Pentateuch [Gr. *πεντάτευχος*, from *πέντε*, five, + *τεῦχος*, book]: Ger. *Pentateuch*; Fr. *Pentateuque*; Ital. *Pentateuco*. The first five books of the Old Testament, containing the Mosaic account of the creation and fall of man, the origin and captivity of the Hebrew race, their flight out of Egypt, the giving of

the law, and the establishment of the Theocratic Commonwealth at Sinai.

The Pentateuch is accepted by Jews and Christians as an inspired record, and the Mosaic law especially constitutes the authoritative basis of JUDAISM (q.v.).

Literature: for modern critical discussions of the Pentateuch and the questions involved see WELLHAUSEN, *Hist. of Israel* (Eng. trans., Edinb., 1885); KUENEN, *The Religion of Israel* (Eng. trans.); W. R. SMITH, *Old Testament in the Jewish Church*; W. H. GREEN, *Moses and the Prophets*. (A.T.O.)

Per accidens [Lat., translates *κατὰ συμβεβηκός*, meaning usually what is not necessary or not *per se*, that is, belonging to some other category than substance]. Boethius first applied the term to a conversion, in opposition to *ad se ipsam*, apparently by carelessness, as if this were *per se ipsam*. He means that the form of the proposition, namely, its quantity, has to be changed in the conversion, whether from universal to particular, or the reverse.

But logicians generally confine conversion *per accidens* to the conversion of the universal affirmative into the particular affirmative; as 'Any chimera is a living thing': hence, 'Some living thing is a chimera.' Some logicians follow an earlier phrase, and say that the universal affirmative is converted *particulariter* after Aristotle's *ἐν μέλει*. (C.S.P.)

Per se: see PERSEITY AND PER SE.

Perception [Lat. *perceptio*, from *percipere*, to perceive]: Ger. *Wahrnehmung* (*Anschauung*, see TERMINOLOGY, German); Fr. *perception*; Ital. *percezione*. (1) Cognition so far as it involves the presence of actual sensation as distinguished from mental imagery.

(2) Cognition of subjective process as such; the apprehension of the actual presence of this process in distinction from the ideal representation of it.

The first case is that of 'sense perception'; the second that of 'inner perception' or introspection. The second usage is not recommended.

The restricted application of the word as defined in the first sense is comparatively modern, and only gradually obtained recognition. The older writers use perception as a synonym for cognition in general. Wolff defines 'Mens percipere dicitur, quando sibi obiectum aliquod repræsentat' (*Psychologia*, § 24). Even now the wider usage occurs occasionally in writers on psychology. Perception, according to Locke, is 'by some called thinking in general' (*Essay*, Bk. II. chap. ix.

§ 1), and he himself regards thinking as a special case of it—the case in which perception involves voluntary attention. Hume's usage is similar. The first English writer who made a serious attempt to give a precise and circumscribed meaning to the word perception is Reid. His views, so far as they are psychological and not epistemological, agree in substance with those of modern psychologists. On the one hand he distinguishes perception from sensation, and on the other from ideal revival. The word sensation connotes only subjective state produced by an external stimulus without implying any awareness of an object. To have a sensation is merely to have a certain kind of feeling due to an impression on the organs of sense. Pure sensation would be purely affective consciousness (see AFFECTION). To have a perception is to be aware of an object by means of a present sensation. Perception is sensation only in so far as sensation conveys a meaning. 'I perceive a tree that grows before my window; there is here an object which is perceived, and an act of the mind by which it is perceived. . . . The object is made up of a trunk, branches, and leaves; but the act of the mind by which it is perceived hath neither trunk, branches, nor leaves. I find nothing that resembles it so much as the remembrance of the tree, or the imagination of it' (Reid, *Works*, Hamilton's ed., i. 183). Modern psychologists in general follow Reid in distinguishing between perception and sensation on the one hand, and perception and ideal revival on the other; but many of them refuse to make these distinctions so sharp and clear-cut as Reid makes them. There is a tendency to regard the distinction between sensation and perception as one of degree, and to treat ideal revival as merely a perception reinstated in a fainter form. A tendency to regard the distinction between sensation and perception as one of degree may take two forms; on the one hand, it may be denied that pure sensation as mere subjective state without cognitive function ever actually exists: this position may be held while the distinction between sensation and perception is in principle sharply recognized. On the other hand, it may be held that the difference between sensation and perception is merely one of complexity. On this view, what is called perception is actual sensation modified and supplemented by the revived residua of past sensations. Thus the distinction between sensation and perception has in principle dis-

appeared; it is regarded as merely a matter of degree. The second position is well represented by James and Titchener; but there is this important difference between them, that whereas James reduces sensation to perception, Titchener reduces perception to sensation.

'It is impossible to draw any sharp line of distinction between the barer and the richer consciousness, because the moment we get beyond the first crude sensation all our consciousness is a matter of suggestion, and the various suggestions shade gradually into each other, being one and all products of the same psychological machinery of association. In the directer consciousness fewer, in the remoter more, associative processes are brought into play' (James, *Princ. of Psychol.*, ii. 76). In general, those who regard the distinction between sensation and perception as one of degree of complexity, also tend to minimise the difference between perception and ideal revival. At the present day this position is best represented in the school of Wundt, of which we may take Titchener as a typical representative. 'Perceptions and ideas are, both alike, groups of sensations; and, both alike, groups of sensations which are held together by the command of nature. They differ solely in this respect: that, when we perceive, the object which arouses the sensations is actually before us, appealing to various sense-organs; whereas, when we have an idea, the object is not before us, but the sensations are set up inside the brain without any disturbance of the organs on the surface of the body' (*Primer of Psychol.*, 95). In his *Outlines of Psychology*, Titchener applies the word idea both to perception itself and to the mental reproduction of it. The whole theory is based on the assumption that there are certain ultimate elements called sensations, and that the whole fabric of cognitive consciousness is built up by compounding these in more or less complex forms. This is a view which the writers are unable to accept. Ideational consciousness does not seem to be merely a more faint and imperfect reinstatement of perceptual consciousness. If, on the one hand, it contains less than perceptual consciousness, on the other hand it contains more. Cf. Stout, *Analytic Psychol.*, ii. 31 ff. (G.F.S.—J.M.B.)

In German the word Perception is not clearly distinguished from *Wahrnehmung* (cf. TERMINOLOGY, German, *sub verbis*). Wundt defines Perception as '*Wahrnehmung* which

is not accompanied by a state of attention' (*Outlines of Psychol.*, 209, Eng. trans. by Judd, who renders the German Perception by apprehension). Cf. Eisler, *Wörterb. d. philos. Begriffe*, 'Perception.'

For philosophical theories of perception see EPISTEMOLOGY.

According to the early Greek thinkers perception was made possible by 'effluvia' (*ἀπορροαί*, Empedocles; cf. Aristotle, *De Gen. et Corr.*, i. 8, 324 b 26) or 'eidola' (*εἰδωλα*, Democritus, Epicurus), which acted in each case as medium or tertium quid between the object and the perceiver. Such media were small particles given off from the surface or pores of a body and conveyed through the air to the senses. The theory of perception was based upon the principle 'like only perceives like'—'*similia similibus percipiuntur*'—and hence the necessity of a tertium quid to mediate between the soul and its unlike object. Cf. Eisler, *Wörterb. d. philos. Begriffe*, 'Wahrnehmung,' 'Ausflüsse,' and 'Eidola.' (J.M.B.)

Perception Time: see REACTION TIME.

Percipient: see TELEPATHY, *passim*.

Perdition [Lat. *perditio*, from *perdere*, to lose]: Ger. *Verdammnis*; Fr. *perdition*; Ital. *perdizione*. In the Jewish and Christian schemes of religious belief, the future state of the wicked and finally impenitent; involving not only the total loss of blessedness, but also a permanent state of retributive suffering. See ESCHATOLOGY (also for literature). (A.T.O.)

Perfectibility [Lat. *perfectibilitas*]: Ger. *Perfektibilität*; Fr. *perfectibilité*; Ital. *perfettibilità*. The theory that human nature is capable of attaining perfection in its individual and social capacity, and that a process of evolution towards that goal is actually going on. More specifically, the doctrine that Christian perfection may be attained in this life.

Literature: see PERFECTIONISM. (A.T.O.)

Perfection [Lat. *perfectus*, complete]: (for foreign equivalents see the next topic but one). (1) Complete realization of an ideal after its kind.

(2) Complete conformity to the demands of law, purpose, or utility.

These senses are often confused, as in the discussion (e. g. Spencer's) of the Good (q. v.). (J.M.B.)

Perfection (in aesthetics). (1) Completeness, absence of deficiency, as 'A perfect tree is one that has all its parts entire.' The 'quantitative' perfection of Kant, Herbart, Zimmermann.

(2) Exact conformity to an objective standard or end.

(3) Conformity to subjective demands, or feeling; that which is exactly as desired, or which pleases in the highest degree.

(4) Absolute embodiment of every desirable quality; divineness.

(5) Any particular quality which adds to the value of an object, as 'Harmony is a perfection.'

Perfection as aesthetic principle was made central by Baumgarten (1750) and his disciple Meier in a sense approaching that of (3). See AESTHETIC. It was considered by Kant in sense (2), and rejected as incompatible with the freedom of beauty, 'since we do not know what a flower, e. g., is intended to be, and hence cannot call it perfect.' Zeising employed it in sense (4), and recently Köstlin has sought to make it central by defining beauty as perfection of form, in senses (1), (3), and (5). Cf. also IDEAL, FITNESS, and SATISFACTION.

Literature: BAUMGARTEN, *Aesthetica*, §§ 14 ff.; KANT, *Crit. of Judgment*, §§ 15–17; STEIN, *Entstehung d. n. Aesth.*, 350 ff.; BRAITMEIER, *Gesch. d. poet. Theorie u. Krit.* (1888–9), 23 ff., 152 ff.; KÖSTLIN, *Proleg. z. Aesth.* (1889), 78–95. (J.H.T.)

Perfection (1) and (2) **Perfectionism** (ethics). Ger. (1) *Vollkommenheit*, (2) *Perfektionismus*, *Perfektibilitätslehre*; Fr. (1) *perfection*, (2) *perfectionnisme*; Ital. (1) *perfezione*,

(2) *perfezionismo* (suggested). (1) Complete realization of the moral ideal, together with complete fulfilment of moral law.

(2) Belief or theory that this realization is possible or actual. (J.S.—J.M.B.)

Perfection has been offered as the moral standard by the intuitionists, in opposition to the utilitarian or hedonistic interpretation of that standard. This theory of perfectionism may be traced to Aristotle's conception of perfect or unimpeded functioning as the true end of every being, and of the perfect functioning of the distinctively human or rational nature of man as man's distinctive end. It is also to be traced to the Cynic and Stoic estimate of virtue or excellence of character (*ἀρετή*) as the supreme human good. In modern ethics, Kant's doctrine of the absolute worth of man as a moral being, of his unique position as an end-in-himself, is also a doctrine of perfectionism. According to Kant, however, perfection is unattainable by man: the moral ideal is infinite, while man's attainments are always finite, and the surd of animal feeling can never be eliminated from human life. The idealistic ethics of self-realization, which is a kind of Neo-Aristotelianism, also sets before man the ideal of perfection, and, since it does not condemn feeling as intrinsically and permanently irrational, regards this ideal as attainable. The Scholastic ethics regards perfection as attainable by man only through the influence of divine grace, enduing him with the 'theologic' or Christian virtues of faith, love, and hope; while the 'counsels of perfection' inculcate the monastic virtues of poverty, celibacy, and obedience. (J.S.)

The requirement of objective right or fulfilment of law is one with that of the attainment of goodness, only in the ideal; but the ideal, i.e. the perfect, must realize both. The element of right or law is especially emphasized by religious philosophy, in which regeneration, or imparting of supernatural grace, supplements human nature, and so makes perfection possible. In religious philosophy, therefore, perfectionism is the doctrine of complete right which is complete goodness, rather than the reverse. (J.M.B.)

Perfectionism (doctrine of, in theology). The belief held by various bodies of Christians that a state of sinless perfection is attainable in this life; the term perfection being construed, however, in a relative sense, which excludes only mortal sins and failures, it being possible for the state to coexist with venial sins and faults of character.

The doctrine of perfectionism rests on a distinction between mortal and venial sins and failings. This distinction is repudiated by the Calvinistic and Lutheran communions, which recognize the absolute divine standard as the only measure of sin and holiness. The believers in perfectionism proceed on the assumption that there is a relative human standard which, if attained to, constitutes the measure of perfect human character. A besetting danger of such a view is the almost irresistible tendency to self-deception which arises from the application of finite standards in the ethical and religious sphere. (A.T.O.)

Perimeter and **Perimetry**: see LABORATORY AND APPARATUS, III, B, (a), (1), and INDIRECT VISION.

Periodicity [Gr. *περί*, around, + *ὁδός*, a way]: Ger. *Periodicität*, *periodisches* (*Irresein*); Fr. *périodicité*, (*folie*) *périodique*, (*délire*) *circulaire*; Ital. *periodicità*. Periodicity in biology and in medicine indicates the recurrence of special events at definite intervals.

The prototypes are the rhythm of theseasons, of waking and sleeping, and the periodicity of the menstrual function. In psychiatry, a certain periodicity of depression and excitement, and of times of normal conditions varying with abnormal ones, has long been recognized, occasionally in connection with menstruation, or in connection with the seasons or on alternate days, &c. Such periodicity has been repeatedly brought into relation with the moon (see the peculiarly suggestive pamphlet of Köster, *Ueber die Gesetze des periodischen Irreseins*, 1877); but neither the menstrual periodicity nor the periodicity observed in mental diseases has as yet been satisfactorily accounted for.

Of late the term has been applied very broadly to conditions varying without any definite regularity, as the attacks of epilepsy and the various attacks of insanity in one lifetime. It is certain that 'irregular periodicity' is far more frequent than the regular types. It is equally certain that this lax usage may lead to a confusion of recurrence, paroxysmal course, and periodicity. Recurrence is the broad term, including periodicity; but a recurrence of typhoid fever is evidently an altogether different thing from a recurrence of paroxysms of epilepsy, or of periodic depression, or periodic mania, or manic-depressive insanity. The tendency is to speak of periodicity where practically no external cause accounts for the recurrence, and of recurrence where the organism itself would not have

undergone repeated attacks without sufficiently obvious external causes.

In the looser sense of the term periodic psychoses, it is by no means necessary that all the paroxysms should be of quite the same duration and type of symptom-complex. Many cases of periodic depression have a constant alternation between healthy and depressed periods; in others an occasional attack of manic excitement may enter into this cycle; and in yet other 'periodic cases' the manic excitements may be the only form of paroxysm, or one or all the attacks may be delirious, paranoic, or stuporous. Since these forms of periodic psychoses show certain common fundamental features, an individual attack is spoken of as an 'equivalent,' just as the various types of attacks of epilepsy are called 'equivalents' of the epileptic attack. In cases where various equivalents have occurred, there is as a rule no possibility of foreseeing which equivalent any exciting cause will call forth, nor how long an attack or an interval will last in any case. Even after a number of regular cycles, irregularities are apt to occur. The fact that there are no sharp lines between the uniform and truly periodic disorders and those less regular seems to fully justify Kraepelin's free use of the term periodicity for irregular recurrence. (A.M.)

Literature: a general discussion of periodicity is RADCLIFFE, Periodicity in Disease, in Quain's Dict. of Med.; a very complete description is in SCHÜLE, Klinische Psychiatrie, 3rd ed. (1886), 287-324. See also the pathological treatises of ARNDT and A. PILCZ. (A.M.—E.M.)

Peripatetics [Gr. περί, about, + πατεῖν, to walk]: Ger. *Peripatetiker*; Fr. *péripatéticiens*; Ital. *peripatetici*. A name given to the school of Aristotle, traditionally because his discussions were carried on while walking about in the Lyceum (*Diog. Laert.*, Bk. V). The modern explanation, however, is that its name is derived from a special path (περίπατος) in the Lyceum used for taking walks.

Theophrastus, Eudemus, Strato, Aristo, Diodorus of Tyre, Andronicus of Rhodes, are among the chief successive heads of the school. The term New Peripatetics is sometimes applied to the writers of the Renaissance, who, in opposition to the Arabian and Christian Aristotelianism of the middle ages, attempted, by returning to the original Greek text, to give an objective setting forth of his doctrine. Pomponatius (d. 1625) and Scaliger (1558) are some of the greater names, most of which,

however, belong to the history of scholarship rather than to that of philosophy. (J.D.)

Peripheral: see CENTRAL.

Peristaltic Contraction [Gr. περί, around, + στέλλω, constriction]: Ger. *Darmbewegung, wurmförmige Bewegung*; Fr. *mouvement péristaltique*; Ital. *moti peristaltici*. Rhythmic wave of constriction which passes normally downward along the alimentary canal, beginning with the act of swallowing in the pharynx and passing successively over the oesophagus, stomach, and intestine. (C.F.H.)

Permanence [Lat. *per*, through, + *manere*, to remain, persist]: Ger. *Permanenz, Beständigkeit*; Fr. *permanence*; Ital. *permanenza*. The condition of fixity, persistence, continuity, especially in time; existing unchanged through a given duration of time.

Beginning with Heraclitus and the Eleatic school, Greek philosophy was much occupied with the problem of rest and MOTION (q.v.), or of self-identity and change, the former being regarded as a sign of Being, and the latter of NON-BEING (q.v.). See also SAME AND OTHER. It was Kant who introduced the category of permanence in the modern sense. It is the critical and phenomenal counterpart of the old dogmatic, ontological conception of substance, and indicates that *quantity* of matter and energy remains unchanged, being neither increased nor diminished, in all changes of phenomena. It is thus the metaphysical counterpart of the scientific doctrine of the conservation of energy—metaphysical because derived not from observation or experience, but treated as a principle which is necessary to the having of experience (Kant, *Critique of Pure Reason*, 160-6, Müller's trans., and Preface to *Metaphysical Foundations of Nat. Sci.*). Cf. BELIEF for the consideration of permanence in the external world. (J.D.)

Perpetual Motion [Lat. *perpetuum mobile*]: Ger. *beständige Bewegung*; Fr. *mouvement perpétuel*; Ital. *moto perpetuo*. A contrivance, arrangement, or combination of natural agencies which will result in the doing of work without the expenditure of a corresponding amount of energy. Long believed impossible, and now known to be so, because in conflict with the law of CONSERVATION OF ENERGY (q.v.).

The term arises from the conception of a machine which should go on for ever without the application of any force from without. Numerous contrivances for this object have been proposed, but, of course, all were unsuccessful in practice. (S.N.)

Persecution (illusions of, mania of) [Lat. *persecutio*, a following after, pursuit]: Ger. *Verfolgungsvorstellungen*, *Verfolgungswahnsinn*; Fr. *manie de la persécution*, *idées délirantes de persécution*; Ital. *delirio* (or *idee morbosa*) *di persecuzione*. In the realm of morbid DELUSIONS (q.v.) a most frequent and persistent form is that which ascribes the patient's abnormal sensations, pains, distress, and mental troubles to the mischievous plotting and persecutions of some one or more persons or agencies.

This so often constitutes the salient mark of the mental malady, that it has received this special name, and in typical cases it is characterized by definite symptoms and stages of development. The condition often begins with hallucinations of hearing, by which are brought to the patient all manner of threats and secret messages. At first these may be resisted, but later they come to dominate the entire life and thoughts of the patient. He is suspicious of every approach, discovers hidden allusions in all that is said or done; believes that a certain person or persons are plotting his destruction, are tormenting him with denunciations or maledictions, and so on. His energies are devoted to devising ingenious ways to avoid and thwart his persecutors. Cf. MONOMANIA.

(J.J.)

Perseity (1) and (2) **Per se** [Lat. *per seitas*, *per se*, through itself]: Ger. *Perseität*; Fr. *perséité*; Ital. *perseità*. (1) Literally, the conception of self-included existence, but in its technical use the term applied to the Thomistic doctrine of the relation of good to the divine will. Cf. ST. THOMAS (philosophy of).

The Scotists held that good was the arbitrary creation of the divine will, in itself superior to it; the Thomists held that will in its adequate expression is essentially moved by the concept of the good as presented in reason, and that this relationship of reason and will holds in the divine nature as well as in the human. The *per seitas boni* is the essential rationality of the good. See WINDLEBAND, *Hist. of Mod. Philos.*, Eng. trans., 332.

(J.D.)

Scotus says there are two kinds of 'perseity,' that of a demonstration and that of a predicate which belongs immediately to its subject.

(2) *Per se* translates καθ' αὐτό, καθ' αὐτόν, &c. Similar phrases occur in ordinary Greek. Plato, for example, in the *Theaetetus*, speaks of ἐπιστήμη ἐν ἐκείνῳ τῷ ὀνόματι, ὃ τι ποτ' ἔχει ἢ ψυχῇ, ὅταν αὐτὴ καθ' αὐτὴν πραγματεύηται περὶ τὰ ὄντα. But in Aristotle

it first becomes a term of art (see Bonitz under εἰαυτοῦ). He enumerates four or five different meanings of it, from which we are led to infer that he did not himself invent it. Two such passages are *Met.*, Δ. xviii. 2, and *Anal. Post.*, iv. There are others, but they are less clear. *Per se* cannot very well be understood without some understanding of the phrase *secundum quid* (καθό). Aristotle says:—

'*Secundum quid* is said in several senses. In one sense it is the species (εἶδος) and essence of anything; thus, that *secundum quid* a man is good is itself good. Another sense is in what anything first comes into existence, as colour in a surface. In the first sense the *secundum quid* is the form (εἶδος); in the second it is the matter and first subject of anything. And, generally speaking, *secundum quid* refers to a cause. "*Secundum quid* comes a man" is "on what account comes he?"; and "*secundum quid* does he paralogize," or "does he syllogize," is "what is the cause of the paralogism" or "the syllogism?" Furthermore, *secundum quid* is said in reference to position in space; as "*secundum quid* stands he," or "*secundum quid* is he walking." In such phrases it denotes position and place.

'Consequently, *per se* is necessarily said in different senses. In one sense, *per se* refers to the essence (τὸ τί ἦν εἶναι) of anything; as, "Callias is *per se* Callias," that is, the very essence of Callias. It also refers to whatever is involved in the definition of anything (ὅσα ἐν τῷ τί ἐστὶν ὑπάρχει), as "Callias is *per se* an animal"; that is, that he is an animal is implied in the word, or animal is what Callias is. The phrase is further applied in case anything in its origin assumes any character in itself or in what belongs to it (εἰ ἐν αὐτῷ δέδεκται πρῶτον ἢ τῶν αὐτοῦ τινῶν); thus white is *per se* a surface, and man is *per se* alive, since the soul, which is part of man, receives life in its very origin. Further, that is *per se* which has nothing else as its cause. Thus there are many causes of man, such as being an animal, being biped, &c.; yet still man is *per se* man. Further, whatever belongs to one thing alone, and in so far as it is alone, is *per se*; so that what is abstract (κεχωρισμένον) is *per se*.'

These five senses are, then, (1) that a substance exists *per se* and not *per accidens*; (2) that an analytical proposition is true *per se*, or formally, and not as matter of fact; (3) that any character which a thing necessarily assumes by virtue of existing, belongs to it *per se*, and not *secundum quid*; (4) that which a thing

causes of itself it does *per se*, and not *per aliud*; and (5) that which any abstraction, *quâ* that which it is, is, does, or suffers, is *per se* and not *secundum quid*.

The second of the above senses is called *per se primo modo*; the third is called *per se secundo modo*; but a different explanation from the above is often given. In reliance particularly on a passage in Aristotle's *Met.*, Z. v, it is said that a predication is *per se secundo modo* where the definition of the predicate contains the subject.

Another important expression is 'known *per se*.' A proposition is known *per se* if, and only if, it is cognoscible from its own terms but not cognoscible in any other way. For instance, that the letters on this page are black is not known *per se*, because it may be proved by testimony. Nor, on the other hand, is the doctrine of the Trinity *per se*, though it cannot be proved; for it is not self-evident. It has to be received on faith. But there was a great controversy between the Thomists on the one hand and the Scotists with the Nominalists on the other, as to whether, in the above definition, the word 'terms' was to be taken *objective* or *formaliter*. See the Conimbricenses in I. *Anal. Post.*, iii. (C.S.P.)

Perseverance (of the Saints) [Lat. *per + severus*, strict]: Ger. *Beharrlichkeit*; Fr. *persévérance*; Ital. *perseveranza*. A doctrine of the Calvinistic creeds, thus stated in the Westminster Confession: 'They whom God hath accepted in the beloved, effectually called and sanctified by his Spirit, can neither totally nor finally fall away from the state of grace, but shall certainly persevere therein to the end and be eternally saved.'

The doctrine of perseverance is founded partly on predestination and the decrees and partly on the nature of regeneration as the birth of a new spiritual nature. It is argued that the decree cannot be thwarted and that the work of regeneration is too radical to be undone. The doctrine is rejected by Arminians, who condition continuance in the new life on the free choice of the will. Man may be truly converted, they argue, and then fall away and become finally reprobate. Calvinists admit the possibility of temporary lapses, but contend that it is never final where conversion has been real and genuine. See CALVINISM.

Persistence (of the external world): see BELIEF, and cf. PERMANENCE, and INERTIA.

Person and **Personality** [Lat. *persona*]: Ger. *Person*, *Persönlichkeit*, *Personalität*; Fr. *personne*, *personnalité*; Ital. *persona*, *personalità*. An individual—and individuality—considered as having the higher reflective, intellectual and moral, attributes of man.

The idea of personality, in its ethical significance, has been influential in modern ethics, especially of the idealistic and intuitionist types. Its origin is partly Christian, partly Roman. The latter conception of personality was essentially legal; and it is in this sense that Hegel uses the term to express the most abstract and external view of morality, the person being the subject of rights. The Christian idea of the absolute moral worth of personality is central in the ethics of Kant, for whom man as a rational being is an end-in-himself and a law unto himself. It is also the standpoint of the Neo-Hegelian ethics of self-realization. For the Scottish school the moral life is essentially personal. (J.S.—J.M.B.)

The term is an objective one, correlative with the psychological or subjective meanings given to PERSONAL IDENTITY and REFLECTION (see those terms). That is, 'consciousness of personal identity' is a way of expressing, from the subjective standpoint, the fact of objective personality; though the best usage would seem to restrict the subjective side of personality to the higher stages of personal consciousness which carry the social distinction between the 'self' and the 'not-self.' The term 'personal' is used both strictly as an adjective of person in the above sense (it is so recommended) and also to mean private to oneself.

Literature: see under SELF, PERSONAL IDENTITY, and INDIVIDUAL. (J.M.B.—G.F.S.)

Person (in law). A being of any sort having rights and duties under the law; the legal subject, of which rights and duties are attributes (Pollock, *Jurisprudence*, chap. v. 108).

Such a human being is a *natural person*. *Artificial, conventional, moral, juristic, or juristical persons* 'are such groups of human beings or masses of property as are in the eye of the law capable of rights and liabilities' (Holland, *Jurisprudence*, chap. viii. 84; Markby, *Elements of Law*, § 138). The person entitled

to a right is styled by Holland (chap. viii. 79) the *person of inherence*; and the person bound to the corresponding duty, the *person of incidence*. A sovereign state is a person, and it may create artificial persons at will. Its treasury may be made one.

A slave, in ancient law, was not recognized as a person. The Roman law recognized artificial persons, created by authority of the state (*Dig.*, xlviii. 22, *De Collegiis et Corporibus*). It is a legal maxim that 'Quando duo iura concurrunt in una persona, aequum est etsi essent in diversis' (Acton's Case, 4 Coke's Reports, 118). Another is that 'Unus homo plures personas habere potest.' (S.E.B.)

Person of Christ. The concrete individuality of Jesus Christ embracing the human and divine natures in one unitary consciousness and experience. See JESUS.

The great question with reference to the Person of Christ has been that of the relation of the human and divine in his nature. All the possible alternatives have found advocates, viz. that the human dominates; that the consciousness of Christ is dominantly divine; that there is a duality of consciousness; that the two elements are maintained in one consciousness.

Literature: see SYNERGISM. (A.T.O.)

Personal: Ger. *persönlich*; Fr. *personnel*; Ital. *personale*. Having the attributes of a PERSON (q. v.).

Contrasted (1) with the impersonal, that to which the concept personal does not apply; also (2) with subpersonal, and (3) with superpersonal—terms which set respectively a lower and a higher limit to the concept of personality.

All of the lower forms of organization which are yet personal in type (e. g. animals, which are said to have an undeveloped form of self-consciousness) are called subpersonal; God or the Absolute, with whose infinity the ascription of the finite attributes of personality is said to conflict, is called super- (or hyper-) personal. Cf. LIMITING NOTION. The duplicate or multiple quasi-personalities sometimes developed in the same organism are described as subpersonalities: they 'tend to assume personal form' (James). The conception of the superpersonal finds recent statement in Bradley's *Appearance and Reality*. (J.M.B.)

Personal Equation: Ger. *persönliche Gleichung*; Fr. *équation personnelle*; Ital. *equazione personale*. An error made by a person in a measurement or exact observation of any kind, which is peculiar to himself,

and which must therefore be determined and allowed for when the precise result of the observation or measurement is to be derived.

The most common example is in time estimates or observations. It is found that when different persons determine with the utmost precision the moment of an occurrence, as of the transit of a star's image across a thread in a telescope, or that of a nerve impulse or perception, different persons will, in the mean of a great many observations, differ in their estimates.

This term was first used in astronomy, the existence of an error in the observations of transits being detected about the close of the 18th century (1795) in a Greenwich observer named Kinnebrook, who was dismissed in consequence by Maskelyne. Its existence as a general feature of the work of all observers was recognized by Bessel and others early in the 19th century. (S.N.)

Bessel (1822) discussed the psychological causes of the personal equation. Originally the time of transit was recorded by watching the star and listening to the ticking of a clock (eye and ear method); about 1850 the method of recording the transit chronographically was introduced. The former of these methods may be regarded as the basis of psychological experiments on the time-phenomena of perception, while the latter led to reaction-time experiments. The personal equation should be carefully distinguished from the REACTION TIME (q. v.), which includes as well that portion of the ERROR OF OBSERVATION (q. v.) which different individuals have in common.

Literature: BESSEL, *Abhandlungen*, iii. 300; WUNDT, *Physiol. Psychol.* See the literature of REACTION TIME. (J.M^cK.C.—J.M.B.)

Personal Identity: Ger. *persönliche Identität*; Fr. *identité personnelle*; Ital. *identità personale* (or *dell'io*). (1) Psychological: the consciousness of IDENTITY (q. v.) attaching to the self.

(2) Equivalent to INDIVIDUALITY (q. v.), i. e. when used descriptively or objectively (which is not recommended; see PERSONALITY).

The psychological sense of personal identity has been much theorized about. It is often made a final and irreducible phase of personal consciousness; part of the definition of the self as conscious. The attempt, however, to analyse the content of self raises the question of the process whereby the apprehension of sameness comes to attach to this as to other

contents, and then the broad question of recognition in general arises with the requirement that the sense of personal sameness or identity be considered a case of this broader phenomenon. Whether this procedure shows that personal identity is a derived or genetic product, would seem to depend on the result of the analysis of recognition: that is, on whether recognition depends exclusively upon objective factors, or whether there is a subjective or 'self-recognition' aspect in all recognition. Even if the result be to show that there is an irreducible element of self-value in all recognition, the further question would still arise, as to whether this element is not, after all, a matter of the presentation of the object-self, and thus a matter of presentative construction—not, after all, an irreducible character of the subject-self. This question arises in regard to the continuous interest which, as is said below, has a leading part in the constituting of individual identity (cf. also what is said of the 'subjective or dispositional' aspect under RECOGNITION). All such expressions, therefore, as 'direct knowledge' of the sameness of self, immediate 'recognitive memory' of self, 'intuition' of self as being the same, &c., have no value in lieu of thorough analysis of the general fact and process of recognition.

(J.M.B.—G.F.S.)

Indicating a more positive view, we may apply what is said of the cognition of individual IDENTITY (q.v.), of which this is a special case. I am aware of myself as one being, because my self has for me unity of interest and exclusiveness of interest. But there exists a complication in the case of personal identity which does not exist in the case of other individuals. I only come to be, in the fullest sense, one person by being aware that I am one person. The consciousness of unity is itself an integral part of the unity of which I am conscious. The unity of self-consciousness is the crown and completion of the unity of consciousness. But the unity of consciousness as expressed in the word 'I' cannot wholly consist in recognition of this unity. Otherwise we should be involved in a circle. The unity must already exist in some manner and degree before it can be cognized. How then is this primary unity constituted? The answer is only to be found if we consider the essential correlation of knowing and willing consciousness with objects known and willed. Subjective process is identical with itself throughout its changing phases if and so far as it is throughout concerned with objects

recognizably the same. The seeking consciousness is one with the finding consciousness, because what is found is identified with what was sought. My unity as one individual person is essentially correlated with the unity of my world as known and willed. And just as the world of knowledge and will possesses different degrees of unity for different individuals and different levels of mental development, so personal identity admits of very varying grades of completeness. It can scarcely be said to exist in lower animals: it is more imperfect in the child than in the adult, and in the savage than in the civilized mind.

The philosophical problem involved in personal identity or individuality, on the other hand, is that of the value and meaning of the category. On the psychophysical side, the theory is prevalent that personal identity represents in some way the more permanent organization in the brain which stands for conscious personality, together with the neurological process underlying recognition. As to the latter, the hypotheses which make it respectively a sensory and a motor phenomenon are cited under RECOGNITION.

The requirement of analysis is enforced by pathological alterations and less grave illusions. Cf. PERSONALITY (disorders of). The complexity of the problem is further illustrated from the opinion of some that in the early and more unreflective stages of personal self-sense the bodily person is included in the content taken for self.

(G.F.S.—J.M.B.)

Personality: see PERSON.

Personality (disorders of): Ger. *Persönlichkeitsstörungen*; Fr. *altérations* (or *troubles*) *de la personnalité*; Ital. (*malattie della*) *personalità*. Disorders of personality involve more or less disorganization of the memory continuum, and of the group of elements which enter into the normal consciousness of personal identity.

(J.J.—J.M.B.)

The analysis of the physiological and psychological basis of personality naturally conditions the exposition of its disorders. A survey of typical cases of altered personality is in itself valuable, and contributes to a clearer understanding of its normal basis. Minor alterations appear in connection with many nervous and mental disorders involving changes

in the general sensibility (conaeesthesia) and in the emotional disposition; the patient feels himself changed and different; his sensations seem unnatural or impersonal; he seems to act automatically and without proper feeling of motives. When hallucinations are combined with this, he may be led to believe that 'some one "makes" his thoughts for him. Another has two bodies lying in different beds. Some patients feel as if they had lost parts of their bodies—teeth, brain, stomach, &c. In some, part is made of wood, glass, butter, &c. In some, part does not exist any longer, or is dead, or is a foreign object quite separate from the speaker's self' (James). So also in the excited conditions of general paralysis, the MEGALOMANIA (q. v.) expresses a modified personality. The patient feels buoyant, possessed of endless strength, or knowledge, or authority, or riches, and, with disordered logical powers, poses this new personality as Hercules, pope, emperor, or God. Alterations of personality become most striking when they alternate in the same individual. Such cases are to be found in the records of hysteria, epilepsy, and obscure functional nervous diseases; and in other cases their relation to the organic feelings and to the emotional changes is marked. A young woman early abandoned to a life of shame, and later placed in a convent, would pass, as the result of nervous disorders, through two periods, believing herself to be alternately prostitute and nun; and in each her tone, manner, dress, and speech were radically different and appropriate. Another patient alternated between lieutenant and monk, seemingly anticipating the return of the other personality, and preparing for it by shaving his beard, changing his dress and his habits. An hysterico-epileptic boy, brought up in beggary and theft, was later trained in useful occupations, and particularly tailoring; but in a return of his earlier personality remembered nothing of his later life, could not sew, and was again the untaught vagabond. From orderly behaviour and polite manners he returned to boorishness with his early stealing propensities.

Still more remarkable are the cases cited by Mac Nish (*Philosophy of Sleep*, 1830); the noted case of Felida, given by Azam, 1858; the case of F., published by Mesnet, 1874; the cases of Lucie (Janet) and Louis V (Bourru and Burot); the case of B., published by Guinon, 1891 (for this see Binet, as cited below); the case of Mary Reynolds and Ansel Bourne (see James, as cited below).

These cases do not admit of synoptic statement, but involve progressive and systematized developments of personalities, irregularly alternating with the normal personality. In one case the abnormal personality gradually usurps the place of the normal; in another the two remain independent and distinct, each series of memories being formed independently of the other; in yet another the memories of one state include the former experiences of previous similar conditions as well as of the normal state, but in the normal state no recollection of the doings of the abnormal state remains. In some cases three or more states are developed. The transition from one state to the other may involve a deep sleep, or only a momentary unconsciousness; its coming may be foreshadowed, or it may appear and disappear suddenly and unexpectedly; the second personality may inherit the automatism and education of the first, or may leave the individual like 'an infant, just born,' yet born in a state of maturity, and with everything to learn anew, and so on.

These more extreme and striking alternations of personality, while constituting an important group of such disorders, are not best suited for an analysis of their origin and nature. This has been attempted by a study of artificially induced personalities in hypnotized subjects; especially in cases of patients exhibiting some form of hysterical anaesthesia. It has been shown that such anaesthesia is not complete, but dissolves under appeal to the subconscious or disaggregative personality which controls it. The anaesthetic member ordinarily feels nothing, but under the influence of suggestion or in a condition of distraction gives unmistakable evidence of its sensibility. The negative hallucinations or systematized anaesthesias of hypnosis fall into the same class, as do also the condition of distraction favourable to AUTOMATIC WRITING (q. v.) and certain forms of trance. Under this view the disorders of personality first described become cases of spontaneous somnambulism, in which a subconscious or disorganized personality comes to the surface, just as it does by suggestion in cases of hysterical anaesthesia. Automatism and suggestibility are common features of both states. Moreover, it has been demonstrated that the forgotten states in spontaneous cases of alternating personality can be recalled during the hypnotic condition. The theories of personality based upon conceptions of this type cannot be regarded as comprehensively satis-

factory; but they furnish a suggestive basis of explanation, and one which embraces in an orderly scheme various forms of alterations of personality.

Under all theories the connection of changes of personality with organic disturbances, particularly in the field of anaesthesias and paraesthesias, is of fundamental importance. In some cases such connection is clear, an anaesthesia appearing in one state and disappearing in another; in other cases it can only be indefinitely inferred. Its influence in alienations of personality has already been noted. But such paraesthesias frequently affect the dominant emotional tone or temperament, and this, whether gay or sad, contemplative and brooding or suspicious, or curious and vivacious and interested, influences the quality and character of the personality. Finally, the influence of distinct hallucinations and the fluctuations and vagaries of a disordered intelligence may develop changes or alienations which are at the mercy of individual fancy, and cannot be expected to conform to the results of logical analysis. The changes of personality incident to spontaneous trance and to the induced trance-states of spiritualistic and other mediums should be cited in this connection, but cannot as yet be described under the light of explanatory principles.

Personification: Ger. *Personification*; Fr. *personnification*; Ital. *personificazione*. A general term for the attribution to natural objects of some or all of the characteristics of personality.

The notion of personification is mainly current in mythology and comparative religion and philology. It is more exactly rendered by the narrower conceptions of ANIMISM (q.v.) in its various forms in philosophy, and EJECTION (q.v.) in psychology. It is distinct from ANTHROPOMORPHISM (q.v.), since it is a further step from personification to identify the personified forces and objects of nature with the anthropomorphized gods. The questions formerly 'treated' under the term personification may now be distinguished somewhat as follows: (1) Does primitive man first of all and naturally look upon nature as in any sense personal, i.e. like himself? (2) If so, in what sense?—physical, forceful, social, mental?—as merely moving, as opposing, as arranging, as planning? These two questions relate to an ultimate personifying category. (3) How does he think of himself, and how does he come by this thought?—is it a reflex of his experience of nature?—the question of INTROJECTION (q.v.)—or does he reach both self and the 'spirits' of nature by special experiences, e.g. from dreams? Cf. DREAM (anthropological). (4) Granted a start in the personifying direction, either natural or acquired, what is the process by which it becomes fuller, takes on its various stages, and finally disappears altogether?

The exact answers to these inquiries will be slow in coming; meanwhile the interpretation of ANIMISM, TOTEMISM, and FETICHISM (see these terms) awaits such answers. The rise of grammatical gender is another cognate and unconsidered question; for gender is in some form a quasi-personal distinction.

The tendency is to accept some sort of a psychological process by which thoughts of self and nature arise in the human mind together, and exist in close correlation. The violent divorce between them is a matter of high development, and the depersonification of nature, in the categories of mechanical science, becomes the real problem, rather than the personification of nature.

Literature: see the citations under the topics referred to, especially under INTROJECTION, and EJECTION. A brief psychological note may be found in HÖFFDING, *Outlines of Psychol.*, 2 ff.; consult also the literature of RACE PSYCHOLOGY, and most of the general works given under ANTHROPOLOGY. (J.M.B.)

Personification (in aesthetics): see SYMBOL.

Perspicuity [Lat. *perspicuus*, clear, from *per* + *spicere*, to look]: Ger. *Perspicuität*,

terms cited below; Fr. *perspicuité*; Ital. *perspicuità*. Perspicuity is said to be an adjunct of truth variously defined. A perspicuous concept is defined by Burgersdicius as one which represents its objects clearly, distinctly, and fully (*Inst. of Met.*, I. xix. 2). Kant, in the *Logik* by Jäsche (Introd., viii), after remarking that aesthetic distinctness (*Deutlichkeit*) often causes objective, or logical, obscurity, and vice versa (as if he had been reading Mill's *Logic* or *Liberty*!), defines perspicuity (*Helligkeit*) as the union of objective and subjective distinctness. Hamilton (*Lects. on Logic*, xxiv) defines a perspicuous definition as one 'couched in terms intelligible, and not figurative, but proper and compendious.' (C.S.P.)

Pertinent [Lat. *pertinere*, to reach to, pertain, be pertinent]: Ger. *zur Sache gehörig*; Fr. *pertinent*; Ital. *convenevole*. In the doctrine of *obligationes*, in logic, pertinent is applied to a proposition whose truth or falsity would necessarily follow from the truth of the proposition to which it was said to be pertinent, and also of a term either necessarily true or necessarily false of another term to which it was said to be pertinent (cf. the *Cent. Dict.*). (C.S.P.)

Perturbation [Lat. *perturbatio*, confusion]: Ger. *Verwirrtheit*; Fr. *perturbation*, *trouble*; Ital. *perturbazione*. Mental perturbation is a condition of disquiet or hesitancy; a restlessness or absence of mental tranquillity. As such it is a normal mental experience, but in extreme degrees, or when of protracted duration, it is characteristic of abnormal conditions. (J.J.)

Perversion [Lat. *perversio*, a turning about]: Ger. *Perversion*; Fr. *perversion*; Ital. *perversione*, *perversione* (ethical). A degeneration or morbid alteration of the instincts, feelings, habits, or modes of thought.

These occur in many forms of insanity and in individuals of morbid, neurotic heredity. Perversions of taste, perversions of the sense of pain, a perverted moral sense have been noted in hysteria, in mania, in idiocy, &c. (Cf. these terms, and also especially MORAL INSANITY, and DEGENERATION.) Sexual perversions have been extensively studied, and are in most cases regarded as symptomatic of nervous or mental disorder; a special case is inversion or homosexuality—sexual instinct directed towards persons of the same sex.

Literature: HAVELOCK ELLIS, *Studies in the Psychol. of Sex*, i; *Sexual Inversion* (1897);

KRAFFT-EBING, *Psychopathia Sexualis*; MOLL, *Conträre Sexualempfindung* (1891). (J.J.)

Pessimism: see OPTIMISM AND PESSIMISM, and cf. MELIORISM.

Pestalozzi, Johann Heinrich. (1746–1827.) Educated in theology and law, his health failed and he devoted himself for some time to farming. Established a school for poor peasant children (1775); failed (1780). Devoted himself to literature for eighteen years. Took charge of an orphan asylum in Stanz (1798–99). Assisted in opening a school in Burgdorf Castle (1799). Elected member of deputation sent by the Swiss to Paris (1802). In 1804 he removed his school to Münchenbuchsee. He removed to the Yverdon Institute the same year. Retired to Neuhof, his earlier farm (1825). He is called the founder of modern pedagogy.

Petitio Principii [Lat. This is a not very good translation of Aristotle's phrase τὸ ἐξ ἀρχῆς (or ἐν ἀρχῇ) αἰτεῖσθαι, to beg what was proposed in the beginning]. It is a FALLACY (q.v.) of a relatively high order, inasmuch as it cannot exist unless the conclusion truly follows from the premises. To accuse a man of begging the question is in reality a plea which virtually admits that his reasoning is good. Its only fault is that it assumes as a premise what no intelligent man who doubted the conclusion could know to be true.

A very necessary, though not always sufficient, precaution against this fallacy is to ask oneself whether the reasoning rests upon any observations, or inductions from observations, or even trustworthy hypothetical inferences from observations, which really involve the conclusion, relating to those matters of experience in reference to which the conclusion is important; and if relating to those things, whether in such a way and so closely that that conclusion really can have been implicitly asserted in those premises. For example, to take an illustration partly fanciful, a man proposes to prove the reality or possibility of clairvoyance to me by proving to me that the sum of the angles of a triangle is two right angles. If, he says, you can sit in your study and know that this is true in the most distant parts of the universe, why may not an exceptionally gifted person know many facts about what happens only a hundred miles away? Upon that, I ask myself whether geometry rests upon any observations concerning clairvoyance or anything like clairvoyance. Nay, the consequence which my arguer has pointed out seems so cogent, and

yet the line of reasoning so inadmissible, that I go up to the garret to exhume my old Euclid or Legendre, to see how it is proved that sitting in my study I can know what the angles of the triangle whose vertices are at Sirius, Arcturus, and Fomalhaut, may sum up to. I find it is done by assuming that certain propositions about space are self-evident. Now, this may be safe enough so far as that sort of reasoning has been millions of times verified. But nothing of the sort has been, or can be, verified exactly; and for such monstrous triangles a divergence from exactitude in the formula may be large, although for terrestrial triangles it be too minute for detection. In short, I am led to see that there must be a *petitio principii* in any argument which, resting merely on common sense, concludes the exact truth of any matter of fact. (C.S.P., C.L.F.)

Petrus Hispanus (Peter of Spain). (1226-77.) A scholastic logician who became Pope John XXI.

Phacoscope: see LABORATORY AND APPARATUS, III, B, (1).

Phantasm [Gr. *φάντασμα*, an appearance]: Ger. *Phantasma*; Fr. (2) *fantôme*; Ital. (2) *fantasma*. (1) Used formerly (as equivalent to the Greek *φάντασμα*) to mean mental pictures or revived images of all sorts. (J.M.B.)

(2) Applied to hallucinations of forms or spectres, whether occurring under normal or quasi-abnormal conditions; apparitions.

The appearances provoked by a dose of opium or hashish, the phenomena of dream-life, the forms conjured up by the excited imagination of religious devotees, the spasmodic or habitual externalizations of the visualizing faculty, may all be spoken of as phantasms. In the literature of the Society for PSYCHICAL RESEARCH (q.v.) the term has received a more specialized meaning, and 'phantasms of the living' is applied to the apparition to a friend or relative of persons still living but approaching death, and as if premonitory of such death. The term phantasmagoria was applied to the raising or recalling of the spirits of the dead, as formerly practised, or as imitated by natural agencies; or again to any series of illusory figures, as those occurring in dreams or hallucinations. (J.J.)

Phariseeism [Gr. *Φαρισαῖος*, Pharisee; Heb. *parush*, separated]: Ger. *Pharisäertum*; Fr. *pharisaïsme*; Ital. *fariseismo*. Self-righteousness in religious profession combined with over-scrupulousness in the observance of forms. Historically, the principles of the Jewish sect

of Pharisees, who in religion united orthodoxy with belief in the authority of oral traditions, and in politics were opposed to foreign dominance and ideas.

The Pharisees first appeared as a party of that name in the reign of John Hyrcanus, 135-105 B.C. From the beginning they represented national exclusiveness and opposition to foreign and especially Greek influences. They were orthodox believers, in opposition to the free-thinking Sadducees. They were the educated class and the intellectual and moral leaders of their time, and, in spite of their shortcomings, stood distinctively for the best elements in Judaism.

Literature: WELLHAUSEN, *Die Pharisaei* und d. Sadusaei (1874); Encyc. Brit., arts. Israel and Messiah. (A.T.O.)

Phase [Gr. *φάσις*, from *φαίνω*, to make to appear, to make visible]: Ger. *Phase*; Fr. *phase*; Ital. *fase*. One of a series of definite forms, or modes of appearance, or specific characters which one and the same subject-matter presents either successively, or from different points of view.

It is often used as synonymous with aspect, but strictly speaking is differentiated by referring to successive, instead of simultaneous, modes of manifestation. It also involves a shade less reference to the subject or percipient, 'aspect' indicating a certain distinction introduced by the way the subject looks at the matter. (J.D.)

Phenomenalism [Gr. *φαινεσθαι*, to appear]: Ger. *Phänomenalismus*; Fr. *phénoménisme*; Ital. *fenomenismo*. (1) The theory that all knowledge is limited to phenomena (things and events in time and space), and that we cannot penetrate to reality in itself. Cf. PHENOMENON, EMPIRICISM, AGNOSTICISM, and POSITIVISM.

(2) The theory that all we know is a phenomenon, that is, reality present to consciousness, either directly or reflectively; and that phenomena are all that there are to know, there being no thing-in-itself or object out of relation to consciousness.

This latter is the philosophy held by Shadworth Hodgson. Cf. also IMMANENCE PHILOSOPHY (q.v.). It is obvious that the two senses differ radically from each other, the first having its point in the assertion of a real but unknown thing-in-itself; the latter in its denial. (J.D.)

Phenomenology [Gr. *φαινόμενον*, that which appears, + *λόγος*, doctrine, theory]: Ger. *Phänomenologie*; Fr. *phénoménologie*; Ital.

fenomenologia. (1) Literally, the theory of appearances or manifestations; in technical use, that theory of the particular, especially historical, facts of any subject-matter which exhibits them as natural and necessary manifestations of their underlying principle. Cf. PHENOMENON.

Hegel thus used the term in his *Phenomenology of Spirit*, to express the progress of mind, individual and racial, from the lowest form of knowledge, through successive necessary stages, to the highest—absolute thought. On the obverse side, it is thus also an exposition of the extent of reason in its generalized or typical temporal stages of development. Among recent writers v. Hartmann is given to using the term to denote the exposition of a general principle with reference to a philosophic construction of historic data.

(2) Kant used the term in a different sense to denote one of the four branches of his *Metaphysic of Nature*; viz. that concerned with motion and rest as regards their modality, that is, their use as predicates of a judgment about things. (J.D.)

Phenomenon [Gr. τὸ φαινόμενον, a thing that is seen, that appears]: Ger. *Phänomen*, *Erscheinung*; Fr. *phénomène*; Ital. *fenomeno*. (1) In Greek thought phenomena were always opposed to essences (*ἔντα*), and hence defined as possessing a lesser and derived form of reality. No particular gulf exists between the two; both are objective, but the phenomena are changeable and manifold, and related to sense, while essences are eternal and one, and related to reason.

(2) But in modern times the phenomenon is opposed to the THING-IN-ITSELF (q.v.) or to the NOUMENON (q.v.). They belong to radically distinct orders; the phenomenon is always relative to us, dependent upon the way the thing-in-itself affects us in sensation, or the way the mind looks at it. This is especially true in Kantian thought. The word appearance (*Schein*) is often used somewhat in this sense—for that which has the SEMBLANCE (q.v.) at least of reality.

(3) It is also used in what we may term a naturalistic or positivistic sense: it is the object or event in space or time, and as such capable of accurate observation and description; reflection based upon it is verifiable.

This third sense is also derived from Kant, but is used without any reference to the subjective factor—to the part played passively by our sensibility and actively by our understanding in the constitution of the phenomenon.

The reconciliation of this third sense, which makes phenomena the data of positive science and thus objective, and the second, which defines them through reference to impressions made upon our senses (which of course would be different if our senses were different), constitutes the chief problem of the concept of 'phenomena.' To meet the difficulty, Kant employed his distinction of matter and form; but since, according to modern science, 'matter' of objects throughout, down to its last sensuous detail, is subject to quantitative laws—since, indeed, it is just this 'matter' which is the real object of science—the distinction of phenomena as related to us, in distinction from objects in themselves, seems practically to fall through.

(4) It is used in a colourless philosophic sense, as equivalent to 'fact,' or event—to any particular which requires explanation. And it may be questioned whether this practical, apparently non-philosophic sense is not in truth the most philosophic of all. (J.D.)

For quotations illustrating special usages see Eisler, *Wörterb. d. philos. Begriffe*, 'Erscheinung.' (J.M.B.)

Philanthropy [Gr. φίλος, lover, + ἄνθρωπος, man]: Ger. *Philanthropie*; Fr. *philanthropie*; Ital. *filantropia*. Disinterested love of our fellow men and action prompted by it.

Such is the altruistic conduct prescribed by Christianity. The Stoic cosmopolitanism, especially in its later Roman form, incited to a love of humanity in general, but fell short of a positive and practical philanthropy through its contempt for the body and the things of the world, as well as through its absolute optimism. It was the genius of Christianity to substitute the new motive of the 'enthusiasm of humanity' for the pagan motive of citizenship. Yet the Greeks possessed the idea and used the term.

Literature: SCHMIDT, *Eth. d. alten Griechen*, i. 308, ii. 277; LECKY, *Hist. of European Morals*, chap. iv. Cf. BENEVOLENCE. (J.S.)

Philo Judaeus, or **Philo**. (cir. 20 B.C.—cir. 50 A.D.) Spent his entire life in Alexandria, excepting a journey to Jerusalem and one to Rome. Of a wealthy and prominent family, he was sent on an embassy of the Jews to Caius Caligula at Rome about 40 A.D. Philo's defence of the Jews was later read in the Roman Senate. He interpreted the sacred books of the Jews. See ALEXANDRIAN SCHOOL.

Philolaus. Lived about the 4th century B.C.; a Pythagorean philosopher.

Philology [Gr. φίλος, lover, + λόγος, discourse]: Ger. *Philologie*; Fr. *philologie*;

Ital. *filologia*. The science 'which deals with human speech, and with all that speech discloses as to the nature and history of man' (Whitney, *Encyc. Brit.*, 9th ed., art. 'Philology'). Cf. LANGUAGE.

Philology is a department of study which seeks to restore a vital sympathy with a past form of civilized life, chiefly through the medium of its language. The relics or monuments of such a life surviving in the form of language, whether as literature, inscriptions, glosses, or other record, constitute, in connection with the language itself as an embodiment of the folk-spirit and an index of the national consciousness, the central objects of attention and the chief materials of the science; but other monuments, such as the material remains dealt with primarily by archaeology, and other data and other points of view—the historical, the geographical, the meteorological, the artistic, the philosophical—are utilized as secondary and interpretative through the co-operation of other sciences or disciplines.

The term philology has often been used, and is still to some extent, particularly in France, in the narrower sense of the scientific study of language, but this use is both historically and practically unjustifiable, except perhaps on the score of brevity. The science of language, whether viewed as a department of philology or as an independent though auxiliary discipline, pursues the study of speech phenomena as a possible end unto itself; philology regards the study as a means to an end. To philology language is the finest mould of a national life and the plastic material of literature.

As scientific or historical grammar usually employs to a greater or less extent the comparative method, it is very commonly called comparative philology, though the term comparative science of language (*vergleichende Sprachwissenschaft*) is more exact.

Literature: see LANGUAGE, and cf. LANGUAGE FUNCTION.

Philosopheme [Gr. *φιλοσόφημα*]: Ger. *Philosophem*; Fr. *philosophème*; Ital. *filosofema*. A demonstrative reasoning supposed to prove a truth from self-evident premises.

It is necessarily, at best, a PETITIO PRINCIPII (q. v.); but it is the Aristotelian ideal of perfect reasoning (see Aristotle, *Top.* viii. 162 a 15, 279 a 30, 294 a 19). (C.S.P.)

Philosopher-king: Ger. *Philosoph auf dem Throne, Herrscher-Philosoph* (Schwegler); Fr. *roi-philosophe*; Ital. *re-filosofo*. A supreme

ruler who is a philosopher, or a philosopher who is a supreme ruler.

Plato declares (*Republic*, v. 474) that until philosophers are kings, or kings philosophers, neither the human race nor the body politic will ever be free from ills. The typical instance in ancient times was Marcus Aurelius; in modern times Joseph II of Austria. In our own days philosophers have not been highly prized as politicians; the separation between men of theory and men of practice has become sharp. This does not necessarily imply an aversion on the part of the practical men to take counsel of the philosophers. (J.B.)

Philosophical Encyclopedia: see ENCYCLOPEDIA (philosophical), and PHILOSOPHY.

Philosophy [Gr. *φίλος*, lover, + *σοφία*, wisdom]: Ger. *Philosophie*; Fr. *philosophie*; Ital. *filosofia*. Four general senses may easily be distinguished: (1) The widest sense, in which it means the explanation of any set of phenomena by reference to its determining principles, whether practical, causal, or logical; theory, reasoned doctrine.

In this sense, it is in common use in English speech. Natural philosophy is physics; and we hear of the philosophy of invention, of machines, of digestion, of hair-dressing, and so on indefinitely.

(2) Used in the same wide sense, but with a clear ethical implication: the power and habit of referring all events and special facts to some general principle, and of behaving (of reacting to the events and facts) in the light of this reference; the working theory of things as exhibited in conduct. Thus we say: he took it philosophically; he is a real philosopher; his philosophy deserted him. In this second sense, there is often an implication of Stoicism in its popular meaning; that is, the reference to general principles enables one to endure or suffer calmly what would otherwise excite emotional disturbance.

(3) The technical and most restricted sense: an account of the fundamentally real, so far as from its consideration laws and truths may be derived, applying to all facts and phenomena: practically equivalent to METAPHYSICS (q. v.).

(4) A theory of truth, reality, or experience, taken as an organized whole, and so giving rise to general principles which unite the various branches or parts of experience into a coherent unity. As such, it is not so much any one discipline or science, as it is the system and animating spirit of all.

Thus Kant, with apparent tautology but real discrimination, speaks of philosophy as the sum of the philosophic disciplines.

In all these various senses, certain common implications appear: (a) *Totality*: philosophy is conceived as a comprehensive view, as dealing (objectively) with the whole or universe, and accordingly as (subjectively) requiring to be pursued in a catholic, impartial spirit. It is thus marked off from what we term the special sciences, which limit their view to some one specific set of facts. Even when, as in (1) above, it is used in reference to a very limited sphere, it yet implies a certain totality within that sphere. (b) *Generality*: just because the view is of a whole, it manifests itself in universals, in principles; it deals with explanations, not with a mere summary, inventory, description, or narration. (c) *Application*: the general truths do not remain inert or sterile, but are carried over to illuminate and make reasonable the relevant details. While this application may primarily be to fact simply as observed or known, it yet extends, ultimately and derivatively, to conduct. The term implies the difference between wisdom and information or learning. The world, or particular subject, getting a certain organization, the acts and habits that have to do with it inevitably assume a corresponding arrangement. While some deprecate this ethical connotation as an intrusion into what should be a purely objective attitude of science, it is too deeply embedded to be exorcized. Hence the narrow meaning (3) has never become fixed, nor made its way into everyday usage. As A. Seth remarks (art. 'Philosophy,' *Encyc. Brit.*, xviii. 806): 'It will not be easy to infuse into so abstract and bloodless a term as "metaphysics" the fuller life (and especially the inclusion of ethical considerations) suggested by the more concrete term philosophy.'

Gathering these various elements together, philosophy may be defined as the theory of a subject-matter, taken as a whole or organized unity; containing principles which bind together a variety of particular truths and facts, and requiring a certain harmony of theory and practice. Since all subordinate and derived subjects are, by the nature of the case, only wholes by courtesy or in a relative sense, the conception forces us back to *the* unity, Experience—to the universe or whatever is taken as a systematic whole.

If any one complain that we have not here, after all, a clear-cut, well-limited definition

of philosophy, the reply is that a certain vagueness, born of the very generality of the idea, is embodied in the conception itself; and that to eliminate this, by holding the term down to just this or that meaning, is to show oneself not so much a philosopher as an adherent of some philosophic sect. In other words, philosophy expresses a certain attitude, purpose, and temper of conjoined intellect and will rather than a discipline whose exact boundaries and contents can be neatly marked off.

The same indefiniteness of outline shows itself when we attempt to divide philosophy into its component parts, or sub-sciences. Various writers have regarded as desirable a regularly recognized subdivision which should be observed by various schools; but this wish, up to the present, is certainly not realized. The need for organization is felt in very different places at different times, and thus very diverse distributions of emphasis arise; e.g. with the early Greeks it was the world of nature which needed to be presented as a totality, hence the tendency of cosmology to be the supreme science; in mediaeval times, it was upon religious experiences that the stress of need fell, and so theology was dominant; with the rise of modern science, it is the methods of discovering truth that need organization, hence the dominance of epistemology, and so on. Now according as one discipline or another is regarded as central, various schemes of arranging the others are set forth.

Moreover, instead of having a formal subdivision, into which materials fall, as matter of fact it is the interpretation of the material which controls the forms. One example will serve: What is the place of aesthetics as a philosophic discipline? Cannot those who differ in principles yet agree upon assigning a certain uniform position to this discipline, to which shall be referred all relevant material? No. The history of thought reveals that, at one period, sense, feeling, and imagination are all regarded as imperfect or confused thought, and hence aesthetics appears as a contributory, and probably minor, part of a dominant intellectual science; at another period the manifestation of truth in the realm of sensuous feeling is one of the co-ordinate spheres of the exhibition of the absolute, the other spheres being its appearance in the realm of intellect (logic), and in that of will (ethics). Or again, a certain equilibrium of sense and intellect is regarded as the highest ideal;

this balance is supposed to be found in beauty, and aesthetics is virtually, at least (as in some aspects of Schelling's thought), the supreme and normative discipline; or ethics is made subordinate to aesthetics, as with Herbert. The various placings of psychology would indicate even more radical divergencies.

It is because the classification and arrangement of philosophic problems is really dependent upon the value and meaning attached to the material concepts of philosophy, that the history of philosophy is now regarded as the best introduction to philosophic study; and the so-called introductions have mainly a pedagogic value, as introducing students in an orderly way to the problems which have arisen historically. Accordingly, further account of these subdivisions is reserved for the historical sketch below.

A schematic classification of problems in philosophy may, however, be made by classifying the various historic philosophies in accordance with the questions that have pre-occupied them, and the points upon which they have insisted in their solutions. Thus philosophic schools are classified: (1) According to the number of fundamental principles recognized, as MONISM, DUALISM, PLURALISM. (2) According to the sort of value attached to the fundamental principle chosen as basis of organization, as MATERIALISM, SPIRITUALISM, and PHENOMENALISM. (3) According to the organ or instrument of knowledge most emphasized, as RATIONALISM and SENSATION-ALISM; or as INTUITIONALISM, INTELLECTUALISM, EMPIRICISM, and MYSTICISM. (4) According to the method pursued: (a) as regards its examination of its own procedure, philosophy is subdivided into DOGMATISM, SCEPTICISM, and CRITICISM; (b) as regards the relation of method to results reached, into AGNOSTICISM and GnosticisM, or into TRANSCENDENTALISM, POSITIVISM, SOLIPSISM, and NIHILISM. (5) According to the relationship assumed between subject and object in knowing, as REALISM (with its various subdivisions, naive, natural, transcendental, hypothetical, reasoned, transfigured, &c.) and IDEALISM (subjective, objective, or absolute).

But since, of course, all actual systems are determined by complex cross-references, any such scheme is extremely formal, save as we keep in mind the influence which, say, the theory of the organ of knowledge has upon the theory of the relationship of subject and object, and upon the conception of the

nature or quality of the object. Thus idealism tends to become identified with spiritualism, and often with rationalism or intuitionism. Dogmatic materialism is replaced by a (relatively) critical MECHANISM, which substitutes the causally connected system of facts and events for the substance, Matter, and so tends towards Positivism or even Phenomenalism. Spiritualism may be dualistic, or even pluralistic as well as monistic; it may run into HYLOZOISM, which is quasi-materialistic, or into PANPSYCHISM; or it may mean just IMMATERIALISM, the denial of the substantial reality of matter, which in turn is identical, from certain points of view, with subjective idealism. If in Monism the theological problem sets the dominant interest, we get PANTHEISM (or even, under certain historic conditions, as with Xenophanes, MONOTHEISM); if the question of relation of mind and body, PARALLELISM; if the problem of reconciling subject and object in such a way as to account for the possibility of knowledge, absolute IDEALISM. It is these interrelations which one informed by the history of philosophy keeps in mind, and thereby avoids a rigid use of any of the terms; while the immature mind ignores them and thus indulges in wholesale proof or refutation of an -ism, refuting, say, Monism as a pantheistic or religious system, but ignoring its bearing as a theory of relation of subject and object in knowledge, and so on. See the topics cited in small capitals.

The traditional ascription of the origin of the term to Pythagoras (as by Cicero and the ancients generally) is probably unfounded. Plato clearly uses the term, first to discriminate the (Socratic) love of truth from the (Sophistic) assertion of it. Man is neither wholly wise (*σοφός*) nor wholly ignorant (*ἀμαθής*), but stands between (*Phaedrus*, 278; *Symposium*, 212; *Lysis*, 218). In this general sense, science, or even any special science, as geometry, is philosophy; morality and art are also forms of it, since the love of beauty and that of virtuous character are stages in the ascent towards complete truth. But it finds its most perfect expression in the knowing which is directed towards true and essential being, as distinct from the (probable) knowledge or opinion which terminates with the sensible and the changing (*Rep.*, v. 477 and 480, vi. 484). Since this knowledge of essential being is dependent upon a particular method, philosophy in its most special sense is dialectic. (For the early

history of the use of the term, with bibliographical references, see Ueberweg, *Hist. of Philos.*, i. § 1. For Plato, see Erdmann, i. 102-4.) But just because the supremely real is the Good, and because true knowing is true virtue, philosophy gets also with Plato an intensely ethical sense; it is the guide to conduct. Thus, indeed, dialectic (the undivided source of logic and metaphysic), ontology, and ethic are all one in the Platonic system, while physics is immediately derivative, since the world of nature is determined by ends, and finally by the Good.

If we do not find formal subdivisions, it is precisely because the material context of the Platonic thought demands a synthetic identification, which to modern analytic tendencies easily seems to be mere confusion. The method of ascending from the world of appearance to the world of being, and the corresponding descent, is not a merely subjective nor even merely logical process; it is paralleled by the relations of subordination and participation which exist objectively in the ideas, among themselves, and in relation to the world of change. Hence there is a refusal to separate logic and ontology; not merely their confusion. If physics is more definitely marked off, it is just because the world of change with which the earlier physicists had exclusively occupied themselves (see NATURE) is distinguished from the world of being; yet since it depends upon it, and since again the essential being is also the Good, the physics of Plato must be, so to speak, just an applied ontology and ethics. Subsequent Greek thought hardly did more than make explicit the distinctions involved in Plato, but often carrying the discriminations necessary for this explicit formulation into separations—the exact character of which depended upon the material context of their own view of the world. Aristotle gives logic that ambiguous position which it retained so long. On one hand, it seems to be propaedeutic and instrumental only; a setting in order of the means by which we most surely attain reality, rather than, as with Plato, also an account of the truth itself; truth is agreement with being, rather than the being itself, and thus Aristotle dismisses dialectic as equivalent to empty and formal, almost verbal, thinking apart from subject-matter; treating it as Plato treated sophistic. But he cannot so far escape the Greek realistic absorption of subject and object into each other, as to regard thinking as merely subjective, and so in his ontology

(called by him first philosophy, and by his followers metaphysic), or account of reality in its comprehensive and fundamental nature, the chief distinctions of thought reappear as distinctions of being: the difference of subject and predicate in judgment as distinction of substance, or essence, and quality and accident in being—so that from one point of view Aristotle's logic is still thoroughly objective (see Adamson, art. 'Logic' in *Encyc. Brit.*, xiv. 792-4). Leaving the exact position of logic unsettled, the other divisions are fairly clear, though not by any means so fixed as they are frequently represented. After his first philosophy or metaphysic comes physics, which treats respectively of the heavens; of meteorology, or the region between earth and heavens; of the history of animals; of biology (within which is included psychology): these (probably with mathematics in his original conception) make up theoretic philosophy. Practical philosophy has two subdivisions, ethics and poetics, corresponding to the distinction of doing and making, or of action and production (*πράττειν* and *ποιεῖν*, *actio* and *factio*), since in one the motive, disposition, and mental habit is the essential thing; in the other, the result, the 'work of art.' Ethics, in turn, deals both with the individual as such, although conditioned by organized social life—ethics in the narrower sense; and with the conditioning organization—politics. Here again an ambiguity similar to that found in the relation of logic to metaphysic affects subsequent thought; on the one hand, the state seems to be the presupposition and the completion of the individual moral life, and thus politics is the wider science; and again it appears as an adjunct or instrument, sometimes a more or less external one, of the individual life—the theoretic virtues, which belong to the individual, and transcend the state, being placed higher than the practical ones.

The distinctions of ontology or metaphysic, of theoretic and practical philosophy, and the subdivision of the former into logic and physics were easily drawn by the successors of Plato and Aristotle, and became its formal or conventional divisions. But, none the less, certain tendencies were at work which, underneath this formal arrangement, profoundly disturbed its equilibrium. Aristotle had expressly identified the supreme reality with God, and thus first philosophy is also theology. With the Neo-Platonists the implied religious factor comes to complete

recognition, and since God as Pure Being is above thought and knowledge (see NEO-PLATONISM), a certain mystic condition of ecstasy becomes the means and sign of unity with him, and philosophy, as theory of the means of attaining this mystic unity, tends to become THEOSOPHY (q. v.). On the other hand, much of the definite content of previous philosophy is formulated for the purposes of the schools, and so leads to a variety of special disciplines; particular branches of science (astronomy, mathematics, &c.) and of culture (grammar and rhetoric) are set off by themselves. This tendency reaches a culmination in Cassiodorus (469-508 A. D.) and Isidorus (560-636 A. D.), who distinguish, and put in encyclopedic form, the trivium, the three arts: grammar, dialectic, and rhetoric, summed up as *logica*; and the quadrivium, the four disciplines: arithmetic, economics, music, and astronomy—called collectively at first mathematics, and later physics. The writings of Isidorus, particularly, were the encyclopedia of the middle ages, and these classifications had great influence.

Another motive was the tendency, in which Stoics, Epicureans, and Sceptics all agreed, to make the practical of more importance than the theoretical, reversing Plato and Aristotle. With the Stoics, philosophy thus becomes the art of virtue; with the Epicureans, the art of living happily. Logic, in particular, takes a distinctly formal position; while physics, with the Epicureans at least, gets an almost negative value, being just the knowledge of nature which will enable one to avoid the burdens of superstition. A notable exception, however, is Lucretius, who, though animated by the same motive, yet develops the atomic theory in such a way as really to make physics the normative centre of philosophy.

All of these motives finally met and combined in the ethico-religious spirit of Christianity, resulting in the conception which identified theology and philosophy. Since theology was conceived at first wholly as a positive or revealed matter, this meant, for a time, the virtual abrogation of philosophy; but as soon as the need was felt of presenting even the purely positive and supernatural content of theology in a reasoned form, philosophy began to revive, although having no independent place. When the need was deeply felt of exhibiting the various church authorities in harmony with themselves and one

another, and still more when the need was to show that there is no contradiction between faith and reason, philosophy became, though still in theological form, supreme. In the latter period, Aristotelianism was revived as furnishing the method and leading ideas of philosophic reason, and naturally his classification of philosophic sciences was more or less followed. There are, however, these differences: (1) Logic is clearly regarded as merely formal and propaedeutic; (2) ontology and metaphysic are identified with theology in a more thoroughgoing way than with Aristotle, and especially, of course, with the doctrines of the Church, particularly that of the Trinity; (3) the positive scientific content of physics is virtually lost, what remains being a philosophy of the creation of nature; (4) ethics is also, of course, submerged in religion, and becomes the theory of the Fall, or of sin and redemption. In view of later psychological developments, it is, moreover, interesting to note that, in spite of the disregard of psychology as a distinct discipline, when any ground for the classification is given, it is a psychological one. Thus with Gilbert of Poitiers (d. 1154) theology corresponds to *intellectus*, while physics is based upon *ratio*. Albertus exhibits the first systematic result of the revival of Aristotelianism, and the need of giving Christianity a reasonable statement over against the Aristotelianism of the Mohammedans, and against the heretics in the Church. Theoretical philosophy is (a) metaphysics, which is identified with theology, because (objectively) it deals with the divine, and because (subjectively) it is possible only through divine illumination, not through natural unaided reason; (b) mathematics; (c) physics. Psychologically, these correspond to the intelligible, the imaginable, and the sensible spheres. Practical philosophy is (a) monastics (that is, dealing with the individual in himself, the nearest approach to ancient ethics); (b) economics (the individual as member of a family); and (c) politics (the individual as a citizen). In spite of the nominal identification of theology and philosophy, Albert, however, makes little attempt to connect the peculiar content of Christian theology with metaphysic, and indeed often emphasizes the distinction between the theological and the philosophical (Aristotelian) view, since the former has a purely practical aim, salvation. Thomas Aquinas, the greatest of the schoolmen, makes the connection explicit. Salvation is the same as knowledge of the truth. The

same God, or Truth, is thus the object of both theology and philosophy.

Nominalism, while not explicitly denying or even interfering with the classic and current distinctions, was yet bringing new elements into philosophy which tended towards a reconstruction. Its theory of universals, &c., tended to submerge logic (such as was not merely verbal) in psychology, and its emphasis upon will tended also in the same direction; while its distinction between philosophy and theology (the doctrine of the twofold character of truth), limiting the latter to positive faith or dogma, even when conceived in a thoroughly pious way, yet tended to give philosophy greater freedom and a basis for adequate attention to empirical facts.

With the Renaissance, philosophy regains its independence, and new points of view arise. Three tendencies are especially important as affecting both the definition of philosophy and its subdivisions. (1) Nature becomes an object of free inquiry, involving observation, experiment, and reflection unhindered by either the principles of Aristotle or the dogmas of the Church. Hence (a) while logic is, with the scholastics, regarded as purely formal (and consequently condemned as of little or no account), a new logic grows up—an account of thought as an instrument or mode of reaching truth. The so-called empiricists, as Bacon and Hobbes, are as much devoted to problems of method as are the rationalists, Descartes and Spinoza. (b) The world of material objects is regarded by many as the object of the most certain and also the most useful knowledge. Bacon tends strongly in this direction—though making provision still for metaphysics and final causes—while Hobbes is explicit and militant in identifying philosophy with the science of ‘bodies.’ And, upon the continent, Descartes, Spinoza, and Leibnitz are all profoundly influenced by concepts resulting from the growth of science; and all feel profoundly the need of a philosophy which will take account of and explain the physical world, newly revealed. (2) Psychology gets a more and more important place. Ancient psychology was distributed through three other disciplines, hardly having any existence of its own. It was partly contained in metaphysical logic, as a theory of the various forms and stages of truth; partly contained (and this is true from Plato, Aristotle, the Stoics and Epicureans, through St. Augustine) in ethics, as an analysis of will, its

relation to desire, intellect, &c.; and partly contained in physics, as Plato derives the individual soul from the world-soul, and Aristotle treats human psychology as the highest part of his biology or theory of life. But the religious tendency of Protestantism; the new political conditions magnifying the individual; the ethics that grew from these tendencies and from the decline of the influence of dogmatic theology; and finally the tendency of all parties to find in an examination of conscious processes the justification, as well as the origin, of method—all conspired to give psychology a central position. And if we are accustomed to associate this tendency more with the names of Locke, Berkeley, Hume, Reid, Hamilton, and Mill, yet it is certainly a characteristic feature of the thought of Descartes, Leibnitz, Kant, Hegel, and Herbart as well. (3) The development, in connection with both the newer logic (or method) and psychology, of interest in the problem of the nature and possibility and implications of valid knowledge (EPISTEMOLOGY, q. v., Erkenntnisstheorie). While Kant first makes this explicitly the basis of all philosophy, occupying the central position of metaphysics with Aristotle, and theology with the scholastics, yet the conception all but breaks through from the time of Hobbes and Descartes.

Two further tendencies remain to note. (i) In the 18th century, through the influence of the ENLIGHTENMENT (q. v.), philosophy came to be regarded as practical wisdom, as knowledge of the world, arranged in some system (though the system was generally but eclecticism) with reference to its bearing upon life (Weltweisheit). While it may be difficult to point out the specific influence of this conception upon technical philosophy, yet it has been absorbed into modern culture (making up, indeed, a large part of the content of the term culture) in thoroughgoing fashion. (ii) In the present century, historical method has had so profound an influence upon philosophic thought, that it is not yet possible to comprehend it, or to state its limits. The prevalence of the method is seen in the tendency to take a dynamic view—to consider objects not as given or fixed, but with reference to a process. In view of this, fixed distinctions and classifications in philosophy tend to be obliterated; we get rather moments, stages of development, &c., a tendency obvious in Hegel, when he ranks under philosophy of spirit ethics, philosophy of state and history, aesthetics, and the philosophy of religion, as

well as anthropology and psychology. For while the series is, of course, in no sense a historical one, it yet would be an incomprehensible jumble if presented in an age not saturated with the historical sense. It appears equally in Spencer when the successive portions of his system are presented as biology, psychology, and sociology. Hence the logic of history tends to replace a purely analytic logic, in setting forth the various spheres which fall within the scope of philosophy and their relations to one another: distinctions based upon positions occupied in a series of stages of development are substituted for those depending upon peculiar values presented in a static whole.

Many still make a radical distinction between questions of genesis, dealing with *how* things came to be, and questions of analysis, dealing with *what* they are, and refer the former, historical question to science, and the latter, analytic one to philosophy; yet it may be asked whether this distinction is not itself a survival of an age which had not the historical point of view; and whether genesis is anything but controlled, orderly, and complete analysis. Cf. *ORIGIN versus NATURE*.

At all events, it is the uncertainty as to the classification of psychology (whether as a special positive science, or a discipline in which logic, aesthetics, and ethics all have their roots), and uncertainty as to the exact value to be assigned to historical development—in its widest sense—that make the subdivisions of philosophy now offered by different writers so diverse, and that tend to reduce them (in default of any standard of certainty) to conveniences of exposition. Cf., besides the topics mentioned, *HISTORY OF PHILOSOPHY, EPISTEMOLOGY, METAPHYSICS, ORIENTAL PHILOSOPHY, and PATRISTIC PHILOSOPHY*. (J.D.)

Literature: see the *Histories of Philosophy* and the *Introductions to Philosophy, BIBLIOG.*, i, Bibliographical; also *BIBLIOG. A, 1, and B, 1. UEBERWEG-HEINZE, Grundriss d. Gesch. d. Philos.* (contains extensive literature lists). Annual bibliographies are issued by the *Arch. f. Philos.* and the *Rev. Néo-Scol.* (J.M.B.)

Philostratus. A name applied to four Greek sophists of the same family of Lemnos. See *PRE-SOCRATIC PHILOSOPHY* (Sophists).

-phobia [Gr. φόβος, fear]: Ger. *-phobie*, *-furcht* (in compounds); Fr. *-phobie*; Ital. *-fobia*. A suffix in general use to indicate excessive or morbid dread of an object, as *AGORAPHOBIA* (q.v.), fear of open places; photo-

phobia, dread of light; neophobia, fear of anything new; mysophobia, fear of dirt or pollution; pyrophobia, fear of fire; symbolophobia, fear that every action has a symbolic or hidden import; phobophobia, a vague, nervous dread even of being afraid; and so on indefinitely. In such terms as hydrophobia (see *RABIES*) the meaning is somewhat modified. Such phobias are symptomatic of weakened conditions of the nervous system, and occur in cases of neurasthenia, hysteria, mania, monomania or paranoia, as well as in persons of quite normal mental health. Cf. Marrel, *Les Phobies* (1895). (J.J.)

Phobophobia: see *-PHOBIA*.

Phonetic Laws: Ger. *Lautgesetze*; Fr. *lois phonétiques*; Ital. *leggi fonetiche*. The laws governing the changes of sound in the historical development of a language.

It is a matter of observation that when a sound changes in one word of a language it changes, if like conditioned, in all. How this shall be accounted for has been matter for much controversy among philologists and psychologists. It cannot, as was at first believed by some, be due to like influence of climate and environment. It cannot furthermore, as contended by Paul, Brugmann, and others, be due to gradual and insensible changes in the individual sound which attack all alike; for observation shows that when changed a sound changes entirely, and often in one word at a time. But there can be no doubt that the change runs from word to word with great rapidity until the whole material of the language is affected. The link between a word containing a given vowel which has suffered change, and one containing the same vowel which has not, can only be the double sound image, the new and the old in the case of the former word. By analogy the new is extended to the second word.

Phonetics [Gr. φωνή, sound]: Ger. *Phonetik*; Fr. *phonétique*; Ital. *fonologia*. The science of speech-sounds.

Sounds are variously classified: (1) vowels and consonants, the former being characterized by resonance, the latter by noise. (2) Vowels, nasal *versus* non-nasal, according as the nasal cavity shares or does not share in producing the resonance. (3) Vowels, wide *versus* narrow, according as the organs of articulation are

slack or tense. French short *i* is much 'narrower' than the English. (4) Vowels, guttural, *a, o, u*, *versus* palatal, *e, i*. (5) Consonants, voiced *versus* voiceless, according as the vocal chords do or do not vibrate; *b, d, z*, are voiced, *p, t, s*, are voiceless. In whispered sounds the vocal chords are only rasped by the breath. (6) Guttural consonants are produced by an articulation of base of tongue with the soft palate; palatals by articulation of body of tongue with hard palate; dentals by articulation of tongue-tip or blade with upper gums near front teeth; labials by articulation of lips; labio-dentals by that of lower lip and upper teeth. (7) Explosives or stops *versus* spirants or fricatives, the former characterized by a check or breaking of a check (*p, b, t, d*), the latter by the rasping of breath against point of articulation (*s, z, f, v*). (8) Aspirate *versus* non-aspirate, the former characterized by a vigorous explosion yielding an after-puff of breath; *p-h*, as in *up-hill*. (9) Long *versus* short, according to time occupied. Vowels and spirants may be indefinitely continued; explosives are instantaneous. The application of 'long' to, e.g., the vowel *i* in *pine* is a source of much confusion and should be avoided. (10) Syllabic *versus* non-syllabic. This is a classification according to function, not nature. A sound is syllabic when used as the nucleus of a syllable. A syllable is a group of sounds associated about a free breath. In *captain* (pron. *cápn*) *n* is syllabic, i.e. is 'used as a vowel.' (11) Pitch, quantity, stress. The singing voice differs from the speaking voice in that music emphasizes the pitch by making the changes more distinct and abrupt, i.e. by breaking up the irregular surface of natural ascents and descents characteristic of speaking, into steps and landings. Quantity is time; long vowels are drawled vowels; in *seize* the vowel is long, in *cease* it is short. The *o* in *note* does not differ in quantity from the *o* in *not*; the former is close, the latter is open.

Stress is the relative force in the out-push of breath. In English stressed syllables are commonly of higher pitch. In Swedish, however, stress and pitch are dissociated.

SWEET, *Primer of Spoken English* (1890); PASSY, *Etude sur les Changements phonétiques* (1890); BREMER, *Deutsche Phonetik* (1893); SOAMES, *Introd. to Phonetics* (1891). (B.I.W.)

Phonology: see LANGUAGE.

Phoronomy [Gr. *phópos*, spatial change (a term used technically by Aristotle), + *vópos*, law]: Ger. *Phoronomie*; Fr. *phoronomie*; Ital. *foronomia*. A technical term in Kant's *Philosophy of Nature*. It means the theory of motion, so far as deducible from *a priori* conceptions, not from empirical observations.

Since space is an *a priori* form of perception, and quantity is an *a priori* function of conception, a pure, rational construction of motion is possible so far as motion can be regarded as a spatial-quantitative fact—namely, as regards (1) direction and (2) velocity. PERMANENCE (q.v.) is the schema of substance as used in constructing phenomena, and is strictly correlative to the idea of change. But change as schematized is motion, which is thus capable of an *a priori* treatment, so far as its concrete presentation or quality can be abstracted from. When this is done, quantity of motion remains (Kant, *Met. Anf. d. Naturwiss.*). (J.D.)

Photometry [Gr. *phôs*, light, + *mérpon*, measure]: Ger. *Photometrie*; Fr. *photométrie*; Ital. *fotometria*. The science of the comparison of the intensities of the radiations from different luminous sources and also of the illuminating powers of sources under different conditions, e.g. different distances, angles, &c. The total radiations may be compared; or the radiation of each source may be analysed into its spectrum, and then the radiations of the same period may be compared (spectrophotometry). Cf. Light, under VISION.

There is no absolute standard of light; but various arbitrary standards have been adopted at different times, e.g. 'standard candle,' Hefner lamp, molten platinum, &c. The unit of luminous intensity may then be defined as the amount of luminous energy emitted in one second by a standard source.

Luminous current is defined as the amount of luminous energy emitted from a point-source, which passes out in one second through a unit solid angle (i.e. luminous current equals luminous energy from a point-source divided by 4π).

The illumination at a point is defined as the luminous current divided by the area through this point which closes the solid angle (i.e. in the case of a point-source, illumination is current divided by the square of the distance from the source to the point).

The brightness of a source is defined as the luminous current leaving unit area of apparent surface.

The luminosity of a colour is a measure of its value as an illuminant, and may be determined by suitable means (see Rood, *Amer. J. of Sci.*, xlii, 1893, 173).

For descriptions of various photometers, reference may be made to the literature (see also the next topic).

Literature: PALAZ, *Industrial Photometry*; WINKELMANN, *Handb. d. Physik*, ii, 1; BRODHUN, *Photométrie*; CREW, *Astrophys. J.*, viii, 299 (1898). (J.S.A.)

Photometry (heterochrome). The science of the determination of the relative intensities of different coloured lights.

Common methods of photometry depend upon varying the objective intensity of one source of radiation until two illuminated fields presented to the eye are seen to be of equal brightness; we have no direct means of estimating how much one surface is brighter than another when they are of unequal brightness. This method becomes very uncertain when the lights to be compared are of different colour (the mean error of observations amounts at best to 6 per cent.), but this is the case which is of special interest to the psychologist. Two other methods are applicable. One is to determine the visual acuity in different illuminations (this is only available for intensities so great that the Purkinje phenomenon does not come into play; for that causes a brightening of certain colours without a corresponding increase of visual acuity, on account of the fact that it increases the effectiveness of the rods only, and hence leaves the fovea unaffected). The other is the so-called flicker-method. This was first suggested by Schaffhäutl (*Münch. Abh.*, iii, 1855), but in an imperfect form. The fact upon which it is based—that the duration at maximal intensity of a retinal impression is totally independent of the colour-aspect of the luminous sensation, and is determined by its brightness only—was established with great accuracy by Ferry (*Amer. J. of Sci.*, xlii, 192, 1892). He applied the method to the determination of the relative brightness of the different parts of the spectrum for the normal and for the colour-blind eye, and found the results coincident with those got by the method of visual acuity, but far more exact. The mean error of observations was brought down to 2 per cent. He compared each spectral colour with black, and found that the duration which is just sufficient to prevent flicker (the daylight state of the eye being preserved) is from .008 to

.036 second. The form of flicker photometry which is usually indicated by the name is that which was proposed by Rood (*Amer. J. of Sci.*, Sept., 1893). In this, instead of alternating a colour-field with black, and getting for each colour the rapidity of alternation necessary to prevent flickering, a minimum rate of alternation is fixed upon, and the brightness of one or the other field is varied until flickering ceases at that rate, the principle being that the least sufficient rate for flicker-extinction is that at which the colours are equally bright.

The method has been applied by Polimanti to the comparison of the central and the peripheral brightness values of the spectrum for normal and colour-defective persons. No statement has been made of the mean error with which these observations are attended, with spectral lights, when the brightness of one field and not the rate of alternation is the variable quantity (*Zeitsch. f. Psychol.*, xix, 1899, 263). (C.L.F.)

Phrenology [Gr. *φρήν*, heart, mind, + *λόγος*, discourse]: Ger. *Phrenologie*; Fr. *phrénologie*; Ital. *frenologia*. A system of correlation of mental faculties and sentiments with cerebral regions, which are supposed to correspond to variations in the configuration of the skull.

Formulated by F. J. Gall (1758–1828) and developed by Spurzheim, Combe, and others, it was first termed ‘Cranioscopy,’ and ‘Physiognomy’; but the term phrenology given to the system in 1815 by Forster was adopted by Spurzheim and permanently retained. The antecedents of phrenology are to be found in popular and scientific notions regarding the purpose of the brain as the seat of the emotions and the intellect, current from the times of Aristotle and Galen, through those of the Scholastics to Descartes and the forerunners of modern anatomical science. Gall’s work is thus a modern systematization of empirical notions of considerable antiquity and of recognizable parentage. In a similar way the phrenological agitation and discussion regarding brain functions, though contributing little of value, may be said to have been influential in stimulating the interest from which developed the modern doctrines of cerebral LOCALIZATION (q. v.). Phrenology achieved its zenith of fame in the early decades of the 19th century, was zealously attacked and defended by scholars and scientists, and by its striking and practical doctrines caught the popular fancy. It was incorporated by Braid with his theories of

hypnotism, and practical applications were attempted on all sides. It still survives in the propaganda of a limited group of enthusiastic but unscientific writers, and among those who profess phrenology as a vocation.

The system itself was somewhat differently expounded by Gall and by Spurzheim, and has received embellishments in modern hands; but in essence, the surface of the skull was mapped out into a considerable number of areas (26 to 43 or more) covering the so-called organs, the activity of which gave rise to the particular psychological traits or faculties. The evidence for the location of the faculties was extremely crude. That part of the head which seemed well developed in a quarrelsome young man became the place of the organ of 'combativeness'; a portion which Gall believed was prominent in pickpockets was identified as 'acquisitiveness'; the head of a beggar who excused his poverty on account of his pride served to locate 'self-esteem'; a hesitating ecclesiastic and a vacillating councillor with large parietal eminences indicated these parts to be the organ of 'cautiousness'; and so on with even slighter and more fanciful analogy. The division of the faculties recognized the distinction between the feelings and the intellect; it divided the former into propensities (impulses to actions) and sentiments (impulses giving rise to emotions as well as actions), which in turn were higher when peculiar to man and lower when shared by the animals. As types of propensities were 'amativeness,' 'philoprogenitiveness,' 'destructiveness,' &c.; of the lower sentiments, 'self-esteem,' 'cautiousness'; of the higher sentiments, 'veneration,' 'hope,' 'wonder,' 'wit.' The intellectual faculties were perceptive, such as 'individuality,' 'size,' 'language,' 'form,' 'number,' 'tune,' 'eventuality'; or reflective, such as 'comparison,' 'causality.'

Considered critically the system involves on its anatomical side a relation between brain function and cranial formation which does not exist; it opposes certain well-ascertained physiological principles and ignores others. On the psychological side it proposes a system of 'faculties' for which there is either only the most superficial basis, or which stands in direct contradiction to the division of function established by the study of the growth, distribution, and decline of human endowments. On its practical side it involves logical fallacies of the most obvious character, and as a system that proposes to delineate character,

and advise in the affairs of life, has the possibility of working serious evil. (J.J.)

Such a scheme as that of the phrenologists is a psychological absurdity. Each of these faculties involves the co-operation of a vast number of fundamental processes, and the same processes enter in varying combination into the constitution of the different faculties. Thus the procedure of phrenology is like that of a man who should assume a different board and a different set of pieces for every game of chess, or a separate alphabet for every word. But the most crushing refutation of phrenology is supplied by what has been ascertained about the modes in which cerebral functions actually are localized. So far as the cortex has been mapped out on good evidence, it is found that the division of function among different parts corresponds not to complex faculties, but to the bodily organs of sensation and movement. One portion of the cortex anatomically connected with the eye is specially correlated with visual consciousness. Another, anatomically connected with the ear, has a similar relation to auditory experience. To take a crucial instance. Language has been regarded by the phrenologists as a distinct faculty with a distinct organ, which is supposed to be peculiarly well developed in actors. As a matter of fact language has been found to involve the functional co-operation of a number of cerebral areas locally separate from one another. (G.F.S.)

Literature: art. Phrenology, in *Encyc. Brit.*, 9th ed. (with citations); works by O. S. and L. N. FOWLER. (J.J.)

Phyletic: see PHYLUM.

Phylogenesis: see PHYLOGENY.

Phylogeny [Gr. *φύλον*, race, + *γένεσις*, origin]: Ger. *Stammesgeschichte*, *Phylogenie*; Fr. *phylogénie*; Ital. *filogenia* (or *-esi*). The ancestry and genetic relationships of an organism.

The results of the study of phylogeny are often graphically expressed by a 'phylogenetic tree.' The process of the evolution or descent of specific forms is called phylogenesis. Cf. PHYLUM, EVOLUTION, ONTOGENY, and RECAPITULATION. (E.S.G.—J.M.B.)

Phylum [Gr. *φύλον*, race]. A term introduced by Haeckel (*Gen. Morphol.*, 1866) to designate the great branches or subdivisions of the Vegetable and Animal Kingdoms. Each phylum may include several classes. The corresponding adjective is phyletic. Cf. CLASSIFICATION. (E.S.G.)

Physical Science: Ger. *Physik*, *exakte*

Wissenschaft; Fr. *science physique*; Ital. *scienza fisica*. In its widest sense, the totality of those branches of science which treat of matter and ether, but make abstraction of all laws peculiar to life. To the Greeks (notably Aristotle) physics was the science of φύσις or of what belonged to nature (φυσικός). Cf. NATURE, and philosophy of NATURE. (S.N.—J.M.B.)

The most general of these branches is physics, which treats of the phenomena exhibited by matter in general and by ether. Adjoining it on one side is astronomy, which treats of the phenomena growing out of the arrangement and motions of matter in the universe at large, the earth included. Adjoining physics on another side is chemistry, which treats of the special properties peculiar to the different kinds of matter. A connecting link between these branches is chemical physics, which treats of laws that, though common to all matter, are modified in their action by special kinds of matter. Yet more specialized branches of physical science are geology, meteorology, &c., which treat of the action of physical and chemical agencies on the matter composing our globe. Cf. SCIENCE, and MATHEMATICS. (S.N.)

Physiocrats [Gr. φύσις, nature, + κράτος, power]: Ger. *Physiokraten*; Fr. *physiocrates*; Ital. *fisiocrati*. A school of French economists, in the latter part of the 18th century, who laid stress on food-supply as the basis and measure of the wealth of nations.

The most prominent exponents of the physiocratic theories were Quesnay, Gournay, Dupont de Nemours, and Mercier-Larivière. The most successful physiocratic statesman was Turgot. The physiocratic school represented a healthful reaction against the theories of the MERCANTILE SYSTEM (q. v.), but made the mistake of undervaluing manufactures almost as much as their predecessors had overvalued them. Their most lasting contribution to economic thought lay in showing the advantages of a let-alone policy, as compared with a system of state interference. (A.T.H.)

Physiognomy [Gr. φύσις, nature, + γνῶμων, a judge]: Ger. *Physiognomie* (-mik, the theory of); Fr. *physiognomonie*, *physionomie*; Ital. *fisionomia*. The connection between mental characteristics and external bodily appearance, and the theory of it. (G.F.S.)

The results reached in connection with EMOTIONAL EXPRESSION (q. v.) constitute about all that is positive under this general heading. The term physiognomy is commonly used for the more subtle aspects of expression, prin-

cipally of the face. Names especially associated with the subject are Lavater, Ch. Bell, Piderit, Duchenne, and Darwin.

Literature: Encyc. Brit., art. 'Physiognomy,' with full citations. (J.M.B.)

Physiological Acoustics: see ACOUSTICS, and HEARING.

Physiological Dispersion Circle: Ger. *physiologische Zerstreuungskreise*; not yet in use in French and Italian. If a group of black dots on white paper is looked at from too great a distance, or with too little illumination, or for too short a time to be sharply discriminated, the dots fuse into a grey blotch, exactly as if they were seen with incorrect accommodation. In the last case, the dots are said to be seen in (physical) dispersion circles. Exner proposes to use the term physiological dispersion circles for the other two cases.

The phenomena are due to the overpassing of the localization-power of the retina. If the spots are of different colours, the colours are fused in accordance with the ordinary laws of colour fusion. See S. Exner in *Pflüger's Arch.* (1898). (C.L.F.)

Physiological Optics: see OPTICS, and VISION.

Physiological Psychology: see PSYCHOLOGY (physiological).

Physiological Selection: Ger. *physiologische Auslese* (or *Selektion*); Fr. *sélection physiologique*; Ital. *selezione fisiologica*. The theory, due to G. J. Romanes, that variations in fertility between individuals produce groups and lead to divergent or polytypic evolution by the principle of ISOLATION (q. v.). (J.M.B.)

The theory regards STERILITY (q. v.) 'as itself the cause of specific differentiation,' acting as a physiological barrier enabling varieties so isolated to diverge into separate species, and leading to the establishment of new characters, just as in the case of individuals of a species cut off by geographical barriers (see NATURAL SELECTION, ad fin.). Cf. FERTILITY, and SELECTION (in biology).

Literature: G. J. ROMANES, On Physiological Selection, Proc. Linn. Soc., v. 19 (1886), and Darwin and after Darwin, iii; K. PEARSON, The Grammar of Science (2nd ed., 1900). (E.S.G.)

Physiologists and Physicists (Greek): see PRE-SOCRATIC PHILOSOPHY (Ionics).

Physiology [Gr. φύσις, nature, + λόγος, science]: Ger. *Physiologie*; Fr. *physiologie*; Ital. *fisiologia*. (1) Science of the functions of living organs and organisms, plant and animal.

By a natural differentiation of the sciences, the word has lost its etymological signification, which would make it mean 'natural philosophy' or the science of all nature. Chemistry and physics now cover the field of non-living matter, physiology that of living matter. Further differentiation, in which anatomy, in its various branches, and morphology deal with forms and relations of organs and organisms, has left to physiology the field of the activities or functions of living things. It is 'the sum of our knowledge concerning the properties of living matter' (Howell in *Amer. Text-book of Physiol.*); the 'science of the vital phenomena of organisms'; 'the doctrine of life' (Landois). Since the growth and formation of an organ or organism is a function of its embryological stages, physiology must remain as a science fundamental to both anatomy and morphology. Conversely, anatomical relations may be used in a limited way to indicate physiological conditions. (C.F.H.)

(2) Sometimes applied, in the expression 'mental physiology,' to the functions of the mind, as in Carpenter's and in Maudsley's *Mental Physiology*. (J.M.B.)

Pico della Mirandola, Giovanni, Count of Mirandola, and Prince of Concordia. (1463-94.) Educated in Bologna and schools of Italy and France. At Florence (1484) he became intimate with the 'Academy,' a circle of Platonists. Sought to reconcile Plato with Aristotle, religion with philosophy. Became a mystic. Charged with heresy by Pope Innocent VIII; absolved by Alexander VI.

Pictograph: see IDEOGRAM.

Pictorial Art: see ART AND ART THEORIES, and CLASSIFICATION (of the fine arts).

Picture (mental): see IMAGE (mental).

Picturesque [Lat. *pictura*, from *pingere*, to paint]: Ger. *malerisch*, *pittoresk*; Fr. *pittoresque*; Ital. *pittoresco*. (1) Appropriate for a picture, or (as applied to language) adapted to raise vivid images or pictures in the mind of the reader or hearer.

(2) A species of aesthetic value characterized especially by the features of ruggedness or irregularity (as contrasted with the beautiful in the narrowest sense, especially with the symmetrical), but without the degree of power or magnitude belonging to the sublime. Its aesthetic value seems to be derived largely (a) from its character of novelty, (b) its consequent vividness and suggestion of animation, (c) its promotion of the aesthetic attitude by the banishing of the utilitarian, and by the sugges-

tion of freer or more purely natural or historic associations, as is seen in a picturesque ruin.

(3) In painting, applied to the effect produced by sudden contrasts of lines or of light and shade; in drawing, a freer as contrasted with a severer manner.

The term was used by Dubos (1719), in the sense first named under (1)—still the meaning of the German *malerisch*. In English it was (according to Stewart) first applied to language, the second use under (1) above, and later to landscape. Price used it to cover aspects of aesthetic value excluded by Burke's definitions of the beautiful and sublime.

Literature: UVEDALE PRICE, On the Picturesque, ed. Lauder (1842); STEWART, Essay on the Beautiful, vol. v of Works, chaps. iv and v; BEGG, On the Devel. of Taste (1887), chap. xii; WÖLFFLIN, Renaissance and Barock (1888). Cf. GROTESQUE, and FANTASTIC. (J.H.T.)

Pietism [Lat. *pietas*, piety]: Ger. *Pietismus*; Fr. *piétisme*; Ital. *pietismo*. (1) A reactionary movement which arose in the 17th century in the German Lutheran Church, against the one-sided intellectualism of the current orthodoxy, and in favour of a more vital religion of the heart and life.

(2) Any religious system or movement which tends to substitute mystical communion and emotional experience for clear conceptions and assured convictions.

The Pietistic movement arose at Frankfort in 1670 under the leadership of Spener, who founded the Collegia Pietatis, or meetings for spiritual communion, in connection with which the name Pietist arose. The movement finally disappeared, not, however, without powerfully affecting the religious life of Europe.

Literature: Hist. of Pietism, by SCHMID (1863), by HEPPE (1870), and by RITSCHL (1880). (A.T.O.)

Pistology (in theology) [Gr. *πίστις*, faith, + *λόγος*, science]: Ger. *Glaubenslehre*; Fr. *doctrine de la foi*; Ital. *dottrina della fede*. The systematic treatment of the organ and content of faith or belief, as distinguished from knowledge and rational apprehension.

In early Christian thinking the *pistis* was distinguished from the *gnosis*, and the problem of the first philosophical minds was how to make the transition from faith and dogma to reason and science. This problem gave rise to Christian philosophy. The early forms of gnosticism were more or less abortive efforts to philosophize the contents of the faith.

Ultimately a differentiation was effected between the philosophical and the more strictly theological branches of the movement, and the development passed out of the earlier into the scholastic stage.

Literature: Histories of philosophy and theology. (A.T.O.)

Pitch [AS. *pic*, height, point of reach]: Ger. *Tonhöhe*; Fr. *diapason*, *hauteur du son*; Ital. *diapason*. The quality of tonal sensation, expressed by musical symbols (c^4 , a_1 , B, d'' , &c.), or by statement of vibration rate, number of vibrations per second (c of 256, e of 640) with which it is correlated. (E.B.T.)

Pithecanthropus erectus (Dubois): see ANTHROPOID (ad fin.).

Pity [OF. *pite*, from Lat. *pietas*, piety]: Ger. *Mitleid*; Fr. *pitié*; Ital. *pietà*. Fellow feeling with the added consciousness that, by reason of some quality or possession of one's own, the untoward condition could not be true of oneself.

This latter qualification marks off pity—and with it compassion, in which there is a touch of mercy, or, in cases of personal injury, of forgiveness—as a special case of SYMPATHY (q.v.). It is recognized, but inadequately, in the popular descriptions of pity as involving superiority, condescension, and as being exercised only towards 'inferiors.' (J.M.B.)

Hobbes applied his principle of the absolute selfishness of human nature to the case of pity, which he defined as 'imagination or fiction of future calamity to ourselves, proceeding from the sense of another man's calamity' (*Human Nature*, chap. ix). Hutcheson maintained, as against this view, that pity is a disinterested and natural sentiment. 'The frame of our nature, on the occasions which move these passions, determines us to be thus affected, and to approve our affection' (*Inquiry*, sect. ii). Butler also holds that pity or compassion is a public affection, directed to 'the good of our fellow creatures' or 'the interests of others.' It is the product of 'a mutual sympathy between each particular of the species, a fellow-feeling common to mankind.' 'For does not everybody by compassion mean an affection, the object of which is another in distress?' (*Sermons*, v. § 1, Note). Similarly, Spinoza defines pity or 'commiseration' as 'pain accompanied by the idea of evil happening to another whom we imagine to be like ourselves' (*Ethics*, Pt. III, 'Definitions of the Emotions,' Def. 18). As pain, it is, in itself, evil; but its result is good, namely, the endeavour, from the dictates of reason alone, to

free from misery the man we pity. 'It follows that a man who lives according to the dictates of reason endeavours as much as possible to prevent himself from being touched by pity' (Pt. IV, Prop. 50, coroll.). Cf. Adam Smith, *Theory of the Moral Sentiments*, Pt. I, sect. i. chap. i. (J.S.)

Plan: see PROJECT.

Plan of Salvation: see SALVATION.

Planchette [Lat. *planca*, Gr. *πλάξ*, a plane, through Fr.]: Ger. *Münzplatte*; Fr. *planchette*; Ital. *tavoletta*. An apparatus for recording delicate movements of the hand, used in experiments on the influence of the subject's thought, or of that of some other personality, upon his hand movements. Cf. MUSCLE READING. (J.M.B.)

Plant [AS. *plante*]: Ger. *Pflanze*; Fr. *plante*; Ital. *pianta*. An organism whose marks of distinction from an ANIMAL (q.v.) are indicated under the latter topic. The sciences which deal with plants are biology and botany. Plants constitute the Vegetable Kingdom. See BIOLOGICAL SCIENCES. (J.M.B.)

Plasm [Gr. *πλάσμα*, anything formed or moulded]: Ger. *Plasma*; Fr. *plasma*; Ital. *plasma*. Hypothetical component parts of the protoplasm or nucleus, having a special function. See CELL.

Weismann assumes a 'germ-plasm'; Nägeli, a 'nutritive plasm,' &c. (C.S.M.)

Literature: Y. DELAGE, *La Structure du Protoplasma et Biol. Gén.* (1895); WILSON, *The Cell*. (E.S.G.)

Plastic Imitation: Ger. *plastische Nachahmung*; Fr. *imitation plastique*; Ital. *imitazione plastica*. (1) See IMITATION (1).

(2) Used by Groos (*Play of Man*, Eng. trans., 313 ff.) for constructive or creative imitation, as in 'plastic' art. (J.M.B.)

Plasticity [Gr. *πλαστός*, from *πλάσσειν*, to mould]: Ger. *Plasticität*; Fr. *plasticité*; Ital. *plasticità*. That property of living substance or of an organism whereby it alters its form under changed conditions of life.

The two theories of the manifestation of plasticity hold respectively (1) that it is a response to stimulation from the environment, the original property being simply general instability of structure not involving tendencies towards specific modifications of any sort; and (2) that it takes the form of specific changes which are inherent in life as such, the environment playing a secondary and purely exciting rôle. This latter is the view of those who accept VITALISM (q.v.).

As to the origin of plasticity, the views

associated with the first theory mentioned above are (a) that it is merely the original instability of protoplasm, or (b) that it is due—especially in the higher forms, as is seen in the plasticity of the brain substance—to natural selection, and is a necessity for ontogenetic development. The second theory given above—that of vitalism—holds that plasticity of the specific sort which it accepts is a fundamental property of life and explains phylogenetic evolution.

It is probable—or possible—that there are two forms of plasticity: (a) that of the living cell wherever found, and of the lowest organisms, by which they respond to various sorts of stimulation; and (b) that of the differentiated and developed structures and organisms whose modifications and variations are within certain defined and well-marked limits for each. It is possible, indeed, that this latter case illustrates the natural selection of certain modifications, i.e. those which served useful ends. In this case the fixity of organic structure, together with its secondary plasticity, has been acquired by the gradual restriction of its original plasticity: thus, according to recent writers (Bailey, Williams, A. Sedgwick), heredity itself as a function may have arisen. There would seem, however, to be no reason to doubt that both processes are true: (1) the gradual reduction of original plasticity and variability, securing certain great organic structural results from which, (2) as a basis, has arisen, through evolution, the relative plasticity of brain, nerve, &c., which allows newer, and especially intelligent, accommodations.

Apart from vital plasticity in general, the facts of individual accommodation make the nature and limits of brain plasticity a matter of great interest. Plasticity underlies all acquisition—especially motor acquisition—and learning. As a matter of endowment, it is contrasted with the fixity of instinct and reflex action; a contrast which, on the psychological side, is seen in educability or the lack of it (see EDUCATION). Cf. ACCOMMODATION (in biology and psychology).

Literature: see LIVING MATTER, NERVE STIMULATION AND CONDUCTION, ACCOMMODATION (in biology); see also BIBLIOG. G, 2, f.

(J.M.B., E.B.P.)

Plato. (429–348 B.C.) Son of Ariston; pupil of Socrates. At military age he probably took part in campaigns of the army. Draco and Epicharmus taught him music, or, at least, poetry. After the execution of Socrates

(399 B.C.), he went to Megara and reviewed the Eleatic doctrine; travelled in Ionia, Cyrene, and Egypt, later in Italy, where he learned more in regard to the Pythagoreans. Owing to a disagreement with the elder Dionysius in Syracuse, he was deprived of his liberty at Aegina. Upon recovering his freedom through the intervention of the Cyrenaic Anniceris, he returned to Athens, and opened his school. He made two fruitless journeys to Sicily, but aside from these he taught in Athens until his death. Born at Athens, his real name was Aristocles. See SOCRATICS (Plato), and cf. NEO-PLATONISM, GREEK TERMINOLOGY, and the principal philosophical topics generally.

Platonism: see SOCRATICS (Plato).

Play [AS. *plegan*, to play]: Ger. *Spiel*; Fr. *jeu*; Ital. *giuoco*. The exercise of any one of the functions of mind and body in a way usually covered by such expressions as 'play is for its own sake,' 'play is not serious,' 'play involves make-believe,' 'play is an indulgence and is contrasted with work,' i.e. with no conscious reason for it except the indulgence itself.

These general characterizations serve to raise the question as to what is the least distinguishing mark of play as contrasted with serious function. This question is discussed from two points of view, the biological and the psychological, which illustrate a distinction in the definition of end or purpose.

Biologically, we have two main theories: the 'surplus energy' theory of Spencer which makes play the using up of surplus energy already accrued to the organism. Play is then an exercise which brings out, generally in an imitative way, the functions whose end is usually strenuous life under stress of the environment. The other theory is the 'practice' theory, urged strongly by Groos, though suggested by earlier writers; it holds that play is a native impulse, not always imitative, whose biological end and utility is to secure practice in the performance of the essential functions of life before they are actually demanded by the exigencies of living. A third theory—rather more physiological—makes play a means to the recuperation of other functions during periods in which the functions set in play are in exercise.

On the psychological side, two main characters have been suggested by different writers as essential to play. SEMBLANCE (q. v.), with a certain 'self-illusion,' or indulgence in conscious 'shamming,' is to some (v. Hartmann, L. Lange) the psychological essential. To

others (Groos' later view, in *The Play of Man*) a function is playfully exercised when it is performed for the sake merely of the pleasure of the action itself. Play is 'autotelic'—its end lies in itself.

The latter of these theories evidently makes the psychological criterion of play much simpler, and so gives to the play-psychosis a broader range. It would seem possible that the biological criterion of play—which ever of the above-noted suggestions we adopt—might be present without any constant psychological play-criterion in force at all; that is, biological play might sometimes be psychological earnest. The general theory of evolution requires only that the criterion on one side or the other have reference to utility.

The subject of play has important bearings in connection with ART AND ART THEORIES (q. v.), with education, and with SOCIAL DEVELOPMENT (q. v.).

The forms of play, known as games, are innumerable, and may be classified under certain great heads, e. g. games of skill, of endurance, of chance, &c. Groos (*Play of Man*, Eng. trans.) divides them according to the functions primarily brought into exercise. The element of personal competition or rivalry seems to be the main impulse in certain games, and that of chance in others, though in many games there is a union of these two great factors. Games of chance have always exercised peculiar fascination and given rise to GAMBLING (q. v.); they are peculiarly human. Theoretically, they are of interest as involving the theory of PROBABILITY (q. v.). Cf. Pearson, *The Chances of Death*, i. 42, and citations in Groos, op. cit.

Literature: GROOS, *The Play of Animals* (see German edition for a full bibliog.); and *Play of Man* (Eng. trans., 1901); SPENCER, *Princ. of Psychol.*; ALIX, *L'Esprit de nos Bêtes*; BREHM, *Das Thierleben*; GUTSMUTHS, *Spiele zur Uebung u. Erholung*; HARTMANN, *Philos. of the Unconscious*; HUDSON, *The Naturalist in La Plata*; K. LANGE, *Die bewusste Selbsttäuschung*; LAZARUS, *Ueber die Reize des Spiels* (1883); COLOZZA, *Il Giuoco nella Psicol. e Pedagogia* (1896); STANLEY, *Evolutionary Psychol. of Feeling*; BALDWIN, *Ment. Devel. in the Child and the Race*; Social and Eth. Interpret.; and *Story of the Mind*; HARRIS, *Psychol. Foundations of Educ.*, 281 ff.; SCHALLER, *Das Spiel und die Spiele* (1861); Kindergarten literature generally. (J.M.B.)

Play-impulse: Ger. *Spieltrieb*; Fr. in-

instinct du jeu; Ital. *impulso al giuoco*. The impulse to indulge in play. Cf. IMPULSE, and PLAY.

This term is better than play-instinct—that is, provided impulse and instinct be employed in the uses recommended in this work—for reasons well stated by Groos (*Spiele der Menschen*, 365 f., 486). The principal reason is that play is a general function, discharging itself through any or many modes of activity, and not restricted—as instincts are—to a definite and uniform mode. To those, however, who use the term instinct—a usage which is full of ambiguities—to apply to all inborn tendencies, play-instinct is a legitimate expression. (J.M.B.)

Play-theory (in art): see ART AND ART THEORIES.

Pleasantness (1) and (2) **Unpleasantness**: Ger. (1) *Lust*, *Wohlgefallen*, *wohlgefällig* (adj.), (2) *Unlust*, *Missfallen* (Judd); Fr. (1) *plaisir*, *agrément*, (2) *peine*, *désagrément*; Ital. (1) *piacere*, (2) *dispiacere*, (1) *aggradevole* (adj.), (2) *disaggradevole* (adj.) (E.M.). Cf. TERMINOLOGY (German and French). See PAIN AND PLEASURE (2).

Agreeableness and disagreeableness are sometimes used, but the terms given are preferred. (J.M.B., G.F.S.)

Pleasure: see PAIN AND PLEASURE.

Pleasure (aesthetic) [Old Fr. *plaisir*; Lat. *placere*, to please]. Pleasant feeling aroused by what is aesthetic. Cf. PAIN AND PLEASURE (2). (1) The word is generally applied by aestheticians to any psychosis whose dominant tone is pleasant, whether it also contains unpleasant elements or not. (J.R.A.—J.M.B.)

(2) It is occasionally employed, after a narrower psychological usage, to designate the affective aspect or phase of an aesthetic state, in distinction from the total psychosis of which this is a part.

On biological grounds aesthetic pleasure has been distinguished from other kinds of pleasure: (1) as springing from activities remote from the life-serving functions (Spencer); (2) as connected with the relatively passive use of a well-nourished end-organ, in this case either eye or ear (Grant Allen).

On psychological grounds aesthetic pleasure has been differentiated: (1) as attaching to certain senses only, i. e. sight and hearing (Bain); (2) by its contemplative attitude (among others Ladd), and (3) its possibility of indefinite prolongation (Sully); (4) as stimulating psychical life-activity under all three of its forms, sensibility, intellect, and will

(Guyau); (5) as the concomitant in feeling of the free, unimpeded activities derived from the play-impulse (Schiller); (6) as felt to inhere in the object after the manner of sensational attributes like colour and weight (Santayana); (7) as arising from the appropriate relation of a perceived impression to the reproductive processes which it arouses (Külpe); (8) as involving relative permanency of pleasantness in revival (Marshall); (9) as due to the 'play of inner imitation' (Groos); (10) as an aesthetic form of sympathy (Lippis).

On grounds other than psychological, aesthetic pleasure has been still further distinguished, (11) by its shareability and disinterestedness (Kant, Schopenhauer), and (12) by its universality (Kant). This last distinction excludes mere pleasures of sense, which are, as such, individual, from the realm of the aesthetic, and furnishes a basis for the demarcation of the beautiful from the agreeable. Compare also FEELING (aesthetic), PAIN (aesthetic), AESTHETICS, and BEAUTY.

Literature: BAIN, *Emotions and Will*, 3rd ed. (1875); GUYAU, *Les Problèmes de l'Esthétique contemporaine* (1897); MARSHALL, *Pain, Pleasure, and Aesthetics* (1894); RIBOT, *The Psychol. of the Emotions* (1897); SANTAYANA, *Sense of Beauty* (1896); BOSANQUET, *Hist. of Aesthetic* (1892). (J.R.A.)

Plenary Indulgence: Ger. *vollkommener Ablass*; Fr. *indulgence plénière*; Ital. *indulgenza plenaria*. A dispensation of the Roman Catholic Church by virtue of which all the temporal punishment due to sin is remitted, the dispensation being conditioned on the prior remission of the mortal guilt and eternal penalty of the sin through repentance and confession.

The institution of indulgences probably arose in connection with the Sacrament of Penance. It is of early origin and is founded on the presumed existence of a surplus of merit from Christ's death after the sins of the world have been atoned for, over which the Church through its possession of the keys has a dispensary power. The abusive exercise of this power was one of the occasions of the Reformation.

Literature: PUSEY, *Irenicon*, Pt. I. 207; CRAMP, *Textbook of Popery*; Herzog's *Real-Encyc.*, i. 67. (A.T.O.)

Plenary Inspiration: Ger. *vollkommene Eingebung*; Fr. *inspiration plénière*; Ital. *ispirazione plenaria*. The theory that the human authors of the Old and New Testament Scriptures were so inspired and directed by

God as to be preserved from error and enabled to express the infallible mind of God. See INSPIRATION.

The doctrine of Plenary Inspiration carries with it that of the inerrancy of the message. It does not, however, extend to the human agency of transcription, &c., and the current claim of inerrancy is made, therefore, only in connection with the original manuscripts.

Literature: GAUSSEN, *Theopneusty* (Eng. trans., N. Y., 1842); ELLIOTT, *Inspiration of the Holy Scriptures*; also references under INSPIRATION. (A.T.O.)

Plenum [Lat. *plenus*, full]: Ger. *continuierliche Raumerfüllung*; Fr. (*le*) *plein*; Ital. (*il*) *pieno*. The existence of matter in every portion of space; matter (or its energy) filling space in such a way as to exclude the possibility of any void or VACUUM (q.v.). (J.D.)

Pleroma [Gr. *πλήρωμα*, fullness]: Ger. *Pleroma*; Fr. *plérôme*; Ital. *pleroma*. A term used by Gnostics (q.v.) to designate the spiritual world intermediate between God and man. It is filled through and through with divine energy, and thus opposed to *κένωμα*, the spatial void.

It is a matter of dispute as to how the Gnostic use is derived from St. Paul's use of the term (Eph. i. 23, iii. 19, and iv. 13; Col. i. 18, 19, ii. 9), and how far St. Paul himself used the term in its philosophic connotation.

Literature: TEICHMÜLLER, *Gesch. d. Begriffe*; MATTER, *Hist. du Gnosticisme*; MANSEL, *Gnostic Heresies*, 51-5, 178, 179 f. (J.D.)

Pletho, surname of **Georgius Gemistus**. (1355-1450.) Born in Constantinople, he held a judicial position in the Peloponnesus, when the Emperor John Palaeologus (1438) took him to Italy to labour for the union of the Greek and Roman Churches. As a pagan he did not wish to see them united, and laboured for their further separation. Spread his own doctrines in Ferrara and Florence, and organized in the latter place a society of Platonists under the patronage of Cosimo dei Medici. The society was called the Academy.

Plethysmograph: see LABORATORY AND APPARATUS, III, B, (1).

Plexus [Lat. *plexus*, woven]: Ger. *Plexus*; Fr. *plexus*; Ital. *plesso*. An interconnected whole where each part is so dependent upon every other part that no adequate account of one constituent can be given apart from its associates.

It is differentiated from the terms SYSTEM and ORGANISM (q.v.) in denoting *de facto* rather than ideal or teleological connection.

It connotes more internal dependence, however, than does the term aggregate. (J.D.)

Plexus (in neurology): Ger. *Nervennetz*; Fr. *plexus, réseau*; Ital. *plesso (nervoso)*. (1) A group of anastomosing fibres outside the central nervous system, especially in the course of the peripheral nerves. It is best to refer to these as Nerve-plexuses or Neuroplexuses.

The term does not imply protoplasmic union, but merely the interweaving of nerve-fibres. Protoplasmic union of dendrites and neurite processes of cells may be termed Neuroreticulum. Cf. NEUROPILEM.

(2) Disperse ganglia, especially those of the SYMPATHETIC SYSTEM (q. v.; cardiac, mesenteric, and hypogastric plexuses). Such an aggregate may be termed a Ganglion-plexus.

(3) Vascular intrusions of the tela (cf. BRAIN) or thin parts of the neural tube into the cavities of the brain. Often in combination, as Metaplexus. The descriptive adjective 'choroideus' is now frequently omitted. (H.H.)

Plotinus. (205-270 A.D.) Born at Lycopolis, Egypt, he went to Alexandria, 232, and for ten years studied under Ammonius Saccas. In 242 he accompanied the Emperor Gordianus to Persia to learn the Persian and Indian philosophies: the emperor was murdered, and he went to Rome, where he taught philosophy with great success. Retired into solitude, 269. Cf. NEO-PLATONISM.

Pluralism [Lat. *plures*, several, many]: Ger. *Pluralismus*; Fr. *pluralisme*; Ital. *pluralismo*. The theory that reality consists in a plurality or multiplicity of distinct beings.

It may be materialistic, as with the ATOMISTS; hylozoistic, as with Empedocles; or spiritualistic, as with Leibnitz. Or, again, it may be conceived as indifferent, as the unknowable reals of Herbart which produce the phenomena both of consciousness and of matter. While opposed to monism as a theory of the essential and ultimate unity of all being, it may agree with it in opposition to a dualistic theory of the opposition of subject and object. The chief difficulties with the system are (a) in the idea of God (as with Leibnitz it seems to be both the highest of the monads, and the system of monads as such), and (b) in the ideas and facts of relationship, order, law, or harmony: if this harmony exists, we seem to have not a sheer plurality, but already an organized system; if it does not we have only chaos, no universe; and (c) in the idea of interaction. This, however, may be regarded only as a special case of (b).

It need hardly be mentioned that we have here to do with one of the most serious problems of philosophy; one which was among the earliest to attract attention, and about which the conflict is most stubborn. The needs which pluralism endeavours chiefly to serve are (1) the possibility of real change, or an objectively valid dynamic view, since monism seems to make change a mere incident in the totality of being, or even a partly illusory phenomenon (Heraclitus and Hegel, however, seem to be dynamic monists in asserting the one reality to be essentially process); (2) the possibility of real variety, particularly in the differences of persons, as monism appears to lend itself to a pantheistic view, regarding all distinctions as simply limitations of the one being; (3) the possibility of freedom, as a self-initiating and moving power inherent in every real *qua* real.

The term pluralism is very recent in English (it is used as early as Wolff in German). Kant uses the term as opposed to egoism and solipsism—the tendency to regard self as only one among many (*Anthropology*). Bowne uses the term incidentally in *Philos. of Theism*, 57; James has probably done more than any one else to give it currency, in his *Will to Believe* (see Preface in particular); and Howison employs it to denote the substantially distinct existence of free ethical personalities (*Limits of Evolution*, and in Royce's *Conception of God*, xiv). (J.D.)

Plurality [Lat. *pluralis*, numerous]: Ger. *Vielheit, Mehrheit*; Fr. *multiplicité, pluralité*; Ital. *pluralità*. More than oneness. See MANIFOLD, MULTIPLICITY, and (especially) UNITY and PLURALITY. Cf. also NUMBER.

According to Eucken (*Philosophische Terminologie*, 63), Scotus Erigena was the first to use *pluralitas* as a technical philosophical term. (J.D.)

Plurality of Causes: Ger. *Mehrheit der Ursachen*; Fr. *pluralité des causes*; Ital. *pluralità delle cause*. John Stuart Mill, in his *System of Logic*, III. v. 3, argues that 'the cause, philosophically speaking, is the sum total of the conditions positive and negative taken together; the whole of the contingencies of every description, which being realized, the consequent invariably follows.' This has been called the doctrine of 'Plurality of Causes.'

This doctrine was not at all new when Mill's *Logic* was put forth. It had been the general view since the Aristotelian phraseology had been given up, and had even been

common under the Aristotelian régime; although the word cause was then loaded down with many different meanings. But when Aristotelians used such phrases as the cause of a *thing*, or of an historical *event*—not of any *fact*, or abstract element of the event, expressible by a proposition, but of the whole *event* in its concreteness, such that no proposition, or book of propositions, or library of books of propositions, could begin to describe it adequately,—when Aristotelians used such phrases, of course they must mean something quite different by a cause, or efficient cause; and in fact we find that they fully recognized that any concrete thing or concrete event has multitudes of ‘efficient causes.’ In some cases they were able to mention one of these as the *principalis efficiens*. In other cases they spoke of one cause as being *principior* than another. The Aristotelian doctrine did an incalculable amount of practical mischief, due to its utter confusion; and this confusion was owing to the attempt to give a meaning to the efficient cause of a concrete thing or concrete event.

Mill recognizes the enormous importance of clearing up the notion of cause. ‘The notion of cause,’ he says, ‘should be, with the utmost practicable degree of precision, fixed and determined.’ Nevertheless, so far is he from making his reader understand that the logical antecedent and consequent are not concrete things or events, but abstract elements thereof precisely and fully expressible by propositions, that after repeated re-readings of what he says, both in his *Logic* and elsewhere, one can but be left extremely doubtful whether Mill regarded the effect, or consequent, as a concrete event (he often says it is ‘an event’) or an abstract element of an event. He, and still more his followers, often seem to speak as if there were no single cause of an effect, in most cases. (C.S.P.)

It seems evident, however, that Mill—‘speaking philosophically,’ as he says—is not concerned with mere logical or abstract antecedence and consequence, but with the statement of the ‘sum total of the conditions’ of a concrete event. Modern idealism puts the same truth, ‘philosophically speaking,’ in the doctrine that reality is a system the statement of which in its entirety is necessary for the statement of any part (fact, event, &c.) of it. See CAUSE AND EFFECT, and CAUSE AND CONDITION. (J.M.B., K.G.)

Plutarch. (cir. 46–cir. 120 A.D.) A famous Greek essayist and biographer. His writings

show a mingling of doctrines from various sources, Greek, Egyptian, Persian, and Italian. Cf. ALEXANDRIAN SCHOOL.

Pneuma [Gr. πνεῦμα, air, breath, spirit]. The vital soul or animating spirit.

It can be defined, however, only with reference to its historical use. Few terms, indeed, embody within themselves a more interesting combination of various sources and motives than does this one. The three chief elements in it are derived from Greek philosophy, from Greek medical science, and from Hebrew religion. The air was conceived as active (the wind) in Greek thought, and as a source of life in plants, animals, and men. Anaximenes, because of its restless, apparently self-caused, activity and its obvious connection (in breathing) with life, identified air with the soul of the universe and of the individual. While subsequent philosophy limited its scope and value, pneuma was universally accepted as a fact, and as something in man which mediated between his life and the larger world, and also between his strictly physiological functions and his higher spiritual nature. Through its relation to warmth (the living body is always warm and always inhaling air) it is the force which organizes the matter of the body, permeating, because of its fineness and activity, all parts. The Greek physicians accepted this doctrine and elaborated it. Praxagoras discovered the distinction between veins and arteries, and regarded the latter as carrying air (since they are empty in a dead person), the former blood; the circulation of this air stands in close relation to health and sickness. His successors regarded this circulation as most important in travelling between the heart as vital centre and brain as centre of thought, and hence as in some sense a connecting link of the physical and psychical.

Meanwhile, the later Peripatetics had taken up the tale and made the pneuma the physiological basis of all psychical activities. The Stoics made the conception (again as with Anaximenes) a cosmic one—it is the objective union of the spiritual and material, God and the world. Earth and water are only condensed air (pneuma), and the psychical is but the highly refined residuum. Meantime Hebrew thought had also conceived the soul as primarily a form of ‘air,’ and made no difference between it, the wind, and respiration. But since it is regarded (in the Old Testament) as breathed into man by God, it loses its materialistic connotations; it is

regarded as something coming into the body from without, instead of being its immanent function; and as the Spirit, itself immaterial, which rules matter. Philo attempted to unite the Greek and Hebrew conceptions, making the pneuma a mediating principle between God (Spirit) and the world (Matter). In the New Testament, it is Spirit *par excellence*, not simply in the psychological sense, but in the ethical—in the sense we associate with the term 'spiritual,' largely, indeed, just because that word was chosen to translate pneuma. Man consists, as with the Greeks, of body, soul, and spirit (pneuma), but spirit is elevated above the soul, not subordinated to it. The concept thus entered radically into the whole mediaeval and modern conception of spirit, and of soul and mind, and was certainly one of the chief factors in developing the concept of soul as a substantial, although wholly immaterial, entity. On the physical side, the doctrine passed over into the theory of animal spirits, and thus played, with Descartes, the same function of connecting soul and body that it had exercised with the Greeks. See Siebeck, *Gesch. d. Psychol.*, ii. Part II. chap. i. (J.D.)

Pneumatograph: see LABORATORY AND APPARATUS, III, B (1).

Pneumatology [Gr. πνεῦμα, spirit, + λόγος, theory, doctrine]: Ger. *Pneumatologie*; Fr. *pneumatologie*; Ital. *pneumatologia*. (1) Literally, the doctrine of spirits, God, angels, and man. See PNEUMA. But, as a matter of fact, the term was chiefly used as the theory of spirits intermediate between God and man, angels and demons, i. e. good and bad. The term was largely appropriated by astrology and magic, though theology continued to use it in its proper sense. In the 17th century it had some vogue (largely in the form pneumatics) as the equivalent of what is now termed psychology. See Franck's *Dict. des Sci. philos.*, sub verbo. (J.D.)

(2) In theology: see PSYCHOLOGY (empirical and rational).

Point [Lat. *punctum*, a small hole, through Fr.]: Ger. *Punkt* (*Punktstanz*); Fr. *point*, *distance ponctuelle*; Ital. *punto*. (1) The unit of distribution of the apparatus of sensation on the skin and mucous membrane.

So we speak of 'hot points,' 'pressure points,' 'pain points,' &c. Since some of these points are areas of considerable extent (see TEMPERATURE SPOT), it is better to speak of them as 'spots' ('cold spots,' 'pain spots,' &c.).

(2) The unit of space discrimination by the eye: as 'luminous point,' &c.

(3) In geometrical optical illusions, a 'point distance' is an extent of space bounded by two points, an undrawn line. (E.B.T.)

Point (in geometry). That which we conceive to have position, but not magnitude. (S.N.)

Poiret, Pierre. (1646–1719.) A French Protestant divine and mystical philosopher who held pastorates at Hamburg and Amsterdam.

Polemics (in theology) [Gr. πολεμικός, warlike]: Ger. *Polemik*; Fr. *polémique*; Ital. *polemica*. That branch of Christian apologetics which has for its aim aggressive warfare upon the foes of Christianity either within or without the Church.

Polemics is opposed to irenics, whose aim is the cultivation of friendly relations. Historically, polemics has dealt chiefly with heresies within the Church. It was first reduced to systematic form by the Jesuits, whose example was soon followed by the champions of Protestantism. Since Schleiermacher, polemics has been recognized as part of theological discipline.

Literature: SCHLEIERMACHER, *Darstellung des theol. Stradismus* (Berlin, 1811); SACK, *Christl. Polemik* (Bonn, 1838); HALL, *Syst. of Divinity* (N.Y., 1847); MCCLINTOCK and STRONG, *Cyc. of Bibl. Knowledge* (1873).

(A.T.O.)

Policy (in law), **Policy of the Law** [Gr. πολιτεία]: Ger. *Staatsklugheit*; Fr. *politique*; Ital. *polizia*. Those general purposes of the municipal law of a state, not declared by statute, which its courts recognize and enforce as necessary for the protection of society.

Public policy, *sound policy*: those general purposes of civil government, not declared by statute, which the courts, in the absence of a statute to the contrary, recognize and enforce as necessary for the protection of society. 'Many contracts which are not against morality are still void as being against the maxims of sound policy' (*Jones v. Randall*, 1 Cowper's Law Reports, 39). 'Contracts illegal at common law, as being contrary to public policy, are such as injuriously affect or subvert the public interest' (*Sedgwick v. Stanton*, 14 N.Y. Law Reports, 291). *Policy of the state*: a general purpose manifested by a long course of legislation on some object, which courts take into view in construing any particular statute on that subject. (S.E.B.)

Political Economy: see ECONOMIC SCIENCE.

Political Institution: see INSTITUTION.

Politics [Gr. *πολιτική*, the science of government]: Ger. *Politik*, *Staatskunst*; Fr. *politique*, or *science politique*; Ital. *politica*. (1) Political affairs.

(2) The science of the STATE (q.v., also philosophy of).

The science of politics is one of the MORAL SCIENCES (q.v.), inasmuch as the phenomena which it investigates have their origin in the human will. Inasmuch as it is concerned not with the individual, but with collections of individuals, it is one of the social sciences. As there is a general science of society (known as sociology), political science is one of the special SOCIAL SCIENCES (q.v.). The relation of political science to political economy has been differently conceived at different times. Political economy owes its name to the fact that economic phenomena were first studied in order to discover the means of increasing the resources of the state. A trace of this original aim is preserved in the title of Adam Smith's *Wealth of Nations*. If political economy were confined to tracing the laws which determine the resources of the state, it would clearly be a branch of political science. But modern political economy concerns itself as well with the laws which govern individual wellbeing. (F.C.M.)

Poly- [Gr. *πολύ*, many, much]: Ger. *poly-*, *viel-*; Fr. *poly-*; Ital. *poli-*. Many, multiple; as polyopia, multiplication of images in vision (occurs in hysteria). (J.J.)

Polylemma: a DILEMMA (q.v.) with a considerable number of excluded hypotheses.

Polysyllogism: a system of syllogisms.

Polysyllogistic proof: a proof consisting of a system of syllogisms. (C.S.P.)

Polygraph: see LABORATORY AND APPARATUS, II (general).

Polylemma: see POLY-.

Polyphyletic: see CONVERGENCE.

Polysyllogism: see POLY-.

Polysyllogistic Proof: see POLY-.

Polytheism: see THEISM.

Polytypic (or Divergent) Evolution: see EVOLUTION, ISOLATION, and PHYSIOLOGICAL SELECTION; and cf. ORGANIC SELECTION.

Pomponatius, Petrus, called **Peretto**. (1462-1524.) He studied medicine as well as philosophy at Padua. Became a teacher first in Padua, then in Ferrara, and finally in Bologna, where he died. The most distinguished Aristotelian scholar of the Renaissance.

Pons asinorum (in logic) [Lat.]. A dia-

gram, attributed to Petrus Tartaretus (about 1480), used to illustrate the relations of the middle term. Cf. MOOD (in logic). The figure is given in Eisler, *Wörterb. d. philos. Begriffe*, 'Eselsbrücke.' (J.M.B.)

Poor Law: Ger. *Armengesetzgebung*; Fr. *système d'assistance publique*; Ital. *legge di assistenza pubblica*. A statute governing the administration of public charity; specifically, the English Poor Law of 1782 (Gilbert's Act), which had an unfortunate effect in promoting mendicancy, and the Act of 1834, by whose workings many of these evils were lightened.

The history of poor relief in England falls into four periods. (1) Down to 1600 the state confined its efforts to the suppression of unnecessary pauperism, leaving the care of the incapable to other agencies. (2) From 1600 to about 1750 the parish authorities were charged with the duty of administering poor-relief, but with strict precautions against abuse. (3) From 1750 to 1833, a period of liberal relief and lax administration. (4) Since 1834, a time of return to stricter tests. Poor-relief in America has been so far a matter of local practice, that it has had no organized or systematic history like that of England. (A.T.H.)

Pope [Lat. *papa*, father]: Ger. *Papst*; Fr. *Pape*; Ital. *Papa*. The title borne, since Gregory VII, exclusively by the bishop of Rome, signifying his primacy and jurisdiction as sole and infallible head of the Roman Catholic Church.

The title was originally given to all Christian teachers, but in time became limited to the primates of Rome, Alexandria, Antioch, Jerusalem, and Constantinople. It was first formally assumed as the exclusive title of the Roman bishop by Siricius (384-98), which use was confirmed by a decree of Gregory VII. The Pope is the supreme teacher, priest, and administrator of the Church. In 1870 the Vatican Council pronounced him infallible when speaking *ex cathedra* in matters of doctrine and morals. See INFALLIBILITY.

Literature: C. B. F. ALLNATT, *Cathedra Petri* (London, 1883); SCHROEDL, *Gesch. d. Päpste*, &c. (1888); MILMAN, *Latin Christianity*; Smith and Cheatham's *Dict. of Christ. Antiq.*, art. Pope. Cf. J. B. MULLINGER, in *Encyc. Brit.* (9th ed.), art. Popedom. (A.T.O.)

Population [Lat. *populare*, to people]: Ger. *Bevölkerung*; Fr. *population*; Ital. *popolazione*. The number of inhabitants dwelling in a given territory at a specified time. If the population of any territory is divided by

the number of units of territorial area (e.g. square miles), the quotient gives the density of population.

Increase of population was regarded as a public good by practically all writers down to the close of the last century. It was reserved for Malthus to show that under conditions of production which may often exist, increase of numbers might result in making the average standard of life lower, and thus be an evil instead of a good. Cf. MALTHUS' LAW.

Some writers (e.g. Nitti) have attempted to show that prosperity tends to check the increase of population; but as all their observations can be equally well accounted for on the hypothesis that increase of population tends to check prosperity, their work can hardly be considered as vitiating the most important of Malthus' generalizations. (A.T.H.)

Porphyry. (233-cir. 303 A.D.) Educated under Origen at Caesarea, Longinus at Athens, and Plotinus at Rome, he became a passionate disciple of the latter. Travelled in Sicily and elsewhere, returning to Rome to live. He was a voluminous writer, but most of his writings are lost. See ALEXANDRIAN SCHOOL.

Port Royal Logic. The name usually given to a treatise entitled *La logique, ou l'art de penser*, published in 1662. It appeared anonymously, but was written by the Port Royalists Antoine Arnauld (called the great Arnauld) and Pierre Nicole.

The former, a man of considerable power, thought and sketched the book, which his collaborator worked up. Being the first Cartesian logic, a book marked, too, by good sense and literary charm, and not without some scientific merit (though it is weak on the inductive side), it became immensely popular, and did a great deal to spread the doctrine of Descartes. It is chiefly celebrated for the prominence it gives to the anti-Aristotelian theory of logical extension and comprehension; although this doctrine does not begin here to take the position it occupied in the Kantian treatises.

It has been translated several times into English, the best version being that of Thomas Spencer Baynes. (C.S.P.)

Port Royalists. A body of ascetic scholars who settled in the deserted monastery of Port Royal and became leaders in the Jansenist movement. See JANSENISM, and PORT ROYAL LOGIC.

The Port Royalists numbered some of the most distinguished scholars of the time. In

philosophy they were influenced by Descartes. They were the leaders in the Jansenite attack on the Jesuits.

Literature: see references under JANSENISM. (A.T.O.)

Porter, Noah. (1811-92.) Educated at Yale College. He was master of the Hopkins Grammar School, New Haven, 1831-3; tutor at Yale, 1833-5; studied theology also, 1833-5; pastor at New Milford, Conn., 1836; located at Springfield, Mass., 1843; Clark professor of metaphysics and moral philosophy at Yale College, 1846; studied German philosophy (chiefly) for one year in Europe, 1853-4; president of Yale College, 1871; resigned, 1885; remained Clark professor until his death.

Posit [Lat. *ponere*, to put, place, lay down]: Ger. *Setzen*, *gesetzt* (posited), *Position* (a positing); Fr. *poser*, *affirmer*; Ital. *porre*, *affermare*. To affirm immediately, that is, not as a result of inference; to assert as given fact; to present as unquestioned existence, not depending on any prior process. Cf. IMMEDIACY (psychical, and logical).

The term had originally, in the main, a logical significance, meaning any premise so far as asserted without reference either to previous argument or to the concessions of a real or supposed opponent. In the post-Kantian movement, however, the term assumed a more metaphysical meaning, in harmony with the general tendency to give an objective rendering to the logical, or to hold that thought has a material and not merely a formal bearing. This tendency is most marked in Fichte. In following the effort, initiated by Descartes, to get something beyond all doubt, absolutely certain in itself, and hence a first principle in itself, he started from assertion as the principle of all judgment, and found as a condition of all judgment whatever, the ultimate and irreducible self-assertion of the Ego—its self-positing. 'The Ego posits originally and simply its own being' (*Werke*, i. 98; see Adamson, *Fichte*, 153-63; Everett, *Fichte's Science of Knowledge*, 71). This act is at the same time a fact; the self-activity of the Ego is its existence. Further metaphysic consists in developing the system of positings implied in and derived from this original positing. Positing is, so to speak, the fundamental category—that in which the logical and ontological are one, in which thought (the activity of Ego) gets objective value.

Hegel, on the contrary, in accordance

with his uniform tendency to do away with the merely or purely immediate, reduces 'positing' to a lower level. It is the UNDERSTANDING (q. v.) which posits; that is to say, positing is dogmatic, unquestioned assertion, which, however valuable and necessary for practical purposes (to get a firm and definite basis from which to proceed), is really a process of reflection. Thus it turns out to be really a supposition involving a presupposition (Voraussetzen). The search for this presupposition is therefore the real 'positing,' since it alone determines what the true being is (Hegel, *Werke*, iv. chap. i). Or, put more simply, it is only as a working datum—a starting-point—that we find anything prior to reflection, and thus can distinguish that which is immediately given from that which is thought. The process of reflection, while apparently merely about the given reality, in the end always decides for us what that reality is, so that the original 'fact' is displaced or transformed, instead of remaining as it was plus a number of new traits externally added to it by reflection. Thus the genuine process of positing is one of determining or defining through the whole system of thought. Cf. HEGEL'S TERMINOLOGY, V, f.

In English the terms posit and pose are rarely used, save to translate the German Setzen; since, however, we use the terms suppose and presuppose freely and in non-technical ways, it is a matter of regret that we have not, like the Greek (thesis and hypothesis) and the German (Setzung, Voraussetzung, Position), the correlates pose and position. (J.D.)

Position (consciousness of bodily): Ger. *Lage-empfindung*; Fr. *sensation de la position (du corps)*; Ital. *percezione di posizione (del corpo)*. The normal perception of bodily position is a complex of visual and tactual (skin, joint, muscle, tendon) factors. The most important of these are probably vision and articular sensation.

The point of reference for orientation is, in most cases, the head (eyes, eye-muscles, neck-muscles). In so far as the perception of position involves sensations of equilibrium or of change of position (progressive rectilinear movement or progressive rotation), the organ of the STATIC SENSE (q. v.) is probably concerned in it. See EQUILIBRIUM (sensation of), and ILLUSIONS OF MOTION. (E.B.T.)

Literature: WUNDT, *Physiol. Psychol.* (4th ed.), ii. 23 ff.; SANFORD, *Course in Exper. Psychol.*, expts. 45, 46; BLOCH, *C. R. de la*

Soc. de Biol. (1896), 81; FÉRÉ, *ibid.* 61; H. BEAUNIS, *Sensations internes*; MORSELLI, *Semej. mal. ment.*, i. (E.B.T.-L.M.)

Positive [Lat. *positum*, from *ponere*, to place]: Ger. *positiv*; Fr. *positif*; Ital. *positivo*. (1) Logical: as applied to judgments, affirmative or asserting, opposed to negative or denying. Applied to terms, referring to a quality which is inherent, while a negative term connotes absence or limitation.

(2) Social and practical: that which depends upon will or convention instead of upon the forces of nature irrespective of human intervention; e.g. positive law, rights, religion, morality, &c. It is opposed to NATURAL (q. v.).

(3) Philosophical: that which depends upon observation of phenomena, or facts in space and time, not upon a thought process: the scientifically verifiable. Opposed to the speculative. See POSITIVISM. According to Comte, mankind passes through the theological and metaphysical stages in arriving finally at the positive. (J.D.)

Positive attribute: an experientially definite attribute, or one which for some other reason appears more definite than its contrary.

Positive denial: an explicit denial, opposed to one which is virtually made by an omission to affirm.

Positive discrepancy: a disagreement between statements consisting in the one asserting what the other positively denies.

Positive distinction: a real distinction between two positively experimental objects, and not merely between an experience and the failure of it. There is a positive distinction between the odours of the rose and the orange-flower; a merely negative one between the perfume of the tea-rose and the want of perfume of the ordinary climber.

Positive idea: an idea due to a positive experience. Locke says: 'Concerning the simple ideas of sensation, it is to be considered that whatsoever is so constituted in nature as to be able, by affecting our senses, to cause any perception in the mind, doth thereby produce in the understanding a simple idea; which, whatever be the external cause of it, when it comes to be taken notice of by our discerning faculty, it is by the mind looked on and considered there to be a real positive idea in the understanding, as much as any other whatsoever: though perhaps the cause of it be but a privation in the subject' (*Essay concerning Human Understanding*, II. viii. 1).

POSITIVE LAW (q.v.): a law laid down, a statute. 'I would not here be mistaken, as if, because I deny an innate law, I thought there were none but positive laws' (Locke, *Essay concerning Human Understanding*, I. iii. 13).

Positive philosophy (see **POSITIVISM**, also (3) above): the system of philosophy of Auguste Comte; so called by him as composed of definite experiential results of science.

Positive proof or evidence: proof or evidence of a definite experience of the fact concluded. Positive proof is not necessarily more certain than negative proof. Thus, if a man comes home from business and finds all the portable valuables and his wife's best clothes gone, the wife having herself disappeared, this negative evidence that she took them is stronger than if a witness of suspicious character were to testify that she did so. Nor is positive proof or evidence the same as direct proof or evidence, as Kant and other writers say; for the fact that a man was in the utmost distress for want of money just after the robbery of a bank would be positive, yet indirect, evidence that he did not commit the robbery.

Positive proposition, judgment, or enunciation: a proposition more experientially definite in its assertion than its negative. An affirmative proposition is one which has the grammatical form of a positive proposition. But the present definition can only be regarded as tentative, since there has been no thorough investigation of the logical nature of the positiveness of propositions.

Positive whole: a whole made up of parts, in contradistinction to a whole indivisible even in thought, such as a person. (C.S.P.)

Positive Law [Lat. *positivus*]: Ger. *positives Recht*, *Satzungsrecht*; Fr. *droit positif*; Ital. *diritto positivo*. Law imposed and enforceable in any community by the sovereign political authority. See Holland, *Jurisprudence*, chap. iv. It is therefore a different thing from natural law, though it may in a particular case reaffirm a rule of natural law, and supply a sanction. Cf. **POSITIVE**.

If it contravenes fundamental principles of natural law, there are authorities of weight which declare it to be void, under a system of free, constitutional government. See *Loan Association v. Topeka*, 20 Wallace's United States Law Reports, 655.

Literature: WOLFF, *Inst. of the Law of Nature and Nations*, i. chap. ii. 39; MONTESQUIEU, *Esprit des Loix*, Liv. I. chap. iii. (S.E.B.)

Positive Theology: Ger. *positive Theologie*; Fr. *théologie positive*; Ital. *teologia positiva*. The system of doctrine which arises from the application of positive categories to the Divine nature; to be distinguished from negative theology, in which the divine nature is symbolized under negative categories.

The distinction between negative and positive theology is of Neo-Platonic origin, and was introduced into Christian thought in the 5th century by the Pseudo-Dionysius, whose work on mystical theology is the classic on this theme. In his representation, God in his essential nature wholly transcends human conceptions, and can be only negatively conceived. The sum of these negative conceptions constitutes negative theology, and is higher than positive theology, which occupies a purely relative place, and arises out of the application of inadequate categories to the divine nature.

Literature: works of DIONYSIUS; MIGNE, *Patrology*; MCCLINTOCK and STRONG, *Cyclopedia of Bibl. Knowledge*, Pt. IV. (A.T.O.)

Positivism: Ger. *Positivismus*; Fr. *positivisme*; Ital. *positivismo*. (1) The assertion of what is instituted in any sphere, as distinct from what is natural; revealed religion, for example. This use is rare.

(2) **DOGMATISM** (q.v.); assurance in holding or asserting philosophic tenets; the antithesis to scepticism, nihilism, negativism. This is also rare.

(3) The name applied by Comte to his own philosophy, and characterizing, negatively, its freedom from all speculative elements; and, affirmatively, its basis in the methods and results of the hierarchy of positive sciences; i.e. mathematics, astronomy, physics, chemistry, biology, and sociology. It is allied to **AGNOSTICISM** (q.v., also **UNKNOWNABLE**) in its denial of the possibility of knowledge of reality in itself, whether of mind, matter, force; it is allied to **PHENOMENALISM** (q.v.) in its denial of capacity to know either efficient or final causation, or anything except the relations of coexistence and sequence in which sensible phenomena present themselves. It differs, however, in insisting upon (a) the possibility and necessity of a relative synthesis or organization of the data of all the sciences; (b) the value of science for prevision and practical control; and (c) its availability, when thus organized and applied, for moral guidance and spiritual support and consolation. See **RELIGION OF HUMANITY**.

(4) The term is used more loosely to denote

any philosophy which agrees with that of Comte in limiting philosophy to the data and methods of the natural sciences—opposition to the *a priori*, and to speculation by any method peculiar to metaphysics. In this sense Locke and Hume were positivists: Hume, indeed, quite explicitly so in limiting the method of philosophizing to the results of observation, and stopping whenever going further means confused and uncertain speculation about hypothetical causes (*Treat.*, i. § 4). Mill and Spencer are called positivists, though thoroughly opposed to Comte in many respects. George Eliot is a positivist in a somewhat more strictly Comtian sense. Cf. NATURALISM. (J.D.)

(J.D.—K.G.—J.M.B.)

Possession [Lat. *possessio*]. One of the categories of Aristotle (ἔχειν, *haben*). See CATEGORY. (J.M.B.)

Possession (demon, &c.): Ger. *Besessenheit*; Fr. (*délire de*) *possession*; Ital. *possessione*, *indemoniamento*. The notion that a disease, such as epilepsy, is due to the possession of the patient by an evil spirit. Cf. DEMONOMANIA, and OBSESSION. (J.J.)

Possibility, Impossibility, and Possible [Lat. *possibile*, from *posse*, may, can, be able; equivalent to the Gr. *δυνατόν*]: Ger. *Möglichkeit*, *Unmöglichkeit*, *möglich*; Fr. *possibilité*, *impossibilité*, *possible*; Ital. *possibilità*, *impossibilità*, *possibile*. The term is used to express a variety of meanings which, although distinct in themselves, yet flow readily into one another. These meanings may best be grouped according as they have (1) an ontological objective value, or a logical subjective value; and (2) according as they are used antithetically to actuality or necessity. The antithetical point of view is the most convenient from which to begin.

Possibility may mean that something is (1) not actual, or (2) that, while it possesses actual existence, that existence lacks causal or rational necessity.

(1) As opposed to the actual, the phrase has again a double meaning. (a) Taken objectively, it may mean something as yet undeveloped, since not presenting itself in actually objectified form, but capable of doing so at some future time, when all the conditions of its realization occur: latent, potential being. This implies capacity for realization; and, if this capacity be taken in an active sense, connotes some inherent tendency to actuality, which if not thwarted leads to final completeness of being. This involves the active sense of POTENTIALITY (q. v.), of FORCE (q. v.), &c. It is close to the literal sense of the term (*posse*, *can be*). This is the dominating sense in Greek philosophy, being connected with Aristotle's teleological theory of development. See NATURE, and POWER (*δύναμις* and *ἐντελέχεια*). (b) Taken logically, it denotes that there is some ground for asserting actuality, but not sufficient to justify a positive statement: *may*, as distinct from *can*, *be*. Thus, possibly it will rain to-morrow. It has to do with degrees of certainty in judging. See PROBABILITY.

(2) As opposed to the necessary, the term has also a double sense. (a) It may mean chance, contingency, as an objective fact. CHANCE (q. v.), again, has a double meaning: (i) something not derivable or explainable causally by reference to antecedent facts. There are those who assert the reality of such chance (see TYCHISM). On this view there are many *possibilities* in store in the future which no amount of knowledge would enable us to foresee or forestall. Indeterministic theories of the will assert possibilities of this sort also. (ii) Chance may mean that which, while necessary causally, is not necessary teleologically: the unplanned, the fatalistic. From this point of view the 'possible' is that which unexpectedly prevents the carrying-out of a purpose or intention. It leads up to the logical sense (b), according to which the possible, as opposed to the necessary, is anything whose existence cannot be derived from reason: that, the existence of which, rationally speaking, might be otherwise. It is opposed to mathematical or metaphysical necessity, where existence cannot be otherwise than as it is. In this sense the objective actual may be only (logically) possible: the present rain-storm is actual, but since it does not follow from a necessity of thought, but only from empirical antecedents, it is not necessary, and hence just a contingent possibility. This distinction goes back also to Aristotle,

being found in his logical writings, as the possible, as potential meaning, is found in his metaphysical. It has played a large part in modern RATIONALISM (q. v.), especially in the philosophy of Leibnitz, being identical with his distinction of 'truths of reason' and 'truths of fact.' In the sphere of mathematics, logic, and metaphysics there is no possibility in the strict sense; all that exists exists of necessity. In the physical and practical spheres which deal with the space and time world the notion of possibility has full sway. Everything is possible which does not contradict the laws of reason; that which is inconceivable, which violates the law of reason, is impossible. The impossible is the self-contradictory. Kant's criticism of rational conceivability as a criterion of truth, to the effect that it is only formal, resting upon the principle of identity and contradiction, and when applied to existence must be supplemented by appeal to sense, made Leibnitz's distinctions of hardly more than historic interest.

The problems regarding the possible as a category of philosophy may be summed up as follows: Does it have any objective existence, or is it simply an expression of a certain logical attitude? If the former, is the objective possibility a necessary phase of a process of development, which will unfold itself into actuality; or does it express a particular fact, the reality of chance? If of logical significance only, does it flow from the distinction between a *a priori* reason and a *posteriori* experience; or does it express a certain combination of ignorance and assurance in relation to facts, so that *real* possibilities would also be experienced facts? (J.D.)

The nominalistic definition (nominalistic in its real character, though generally admitted by realists, as Scotus, i. dist. 7, qu. unica) that that is possible which is not known not to be true in a real or assumed state of information is, like many nominalistic definitions, extremely helpful up to a certain point, while in the end proving itself quite superficial. It is not that certain things are possible because they are not known not to be true, but that they are not known not to be true because they are, more or less clearly, seen to be possible.

For example, one collection may be said to be greater than another if, and only if, there is no *possible* relation in which every member of the former collection stands to a member of the latter, to which no other

member of the former stands in the same relation. Now, the question arises—whether or not it is possible for two collections to be, under this definition, each greater than the other. In advance of an investigation, the *proposition* is possibly true, in the sense that we do not know that it is impossible. But is the *fact* possible? That is, can we in any way suppose such a state of things without involving ourselves in contradiction? It is that positive supposition which will constitute the possibility, not the mere ignorance of whether such a supposition can be made or not. In order to make two such collections possible, we must make some positive assumption in regard to the possibility of collections; while in order to make such a relation between two collections impossible, we have to make a positive assumption of the possibility of a certain description of relation. It is not a question of ignorance, since nothing but pure hypothesis is concerned. The question is whether it is possible in every case to suppose distinct pairs each composed of a member of either collection and such as completely to exhaust one of the collections. If this is always possible, then two collections each greater than the other are impossible. It is evidently desirable to state the logical principles of this general kind of possibility, which does not consist in ignorance, but, as it would seem, in hypothetic indetermination or disjunctive determination.

Nominalists uniformly speak of Aristotle's view of future contingents as really absurd. It may be so; but it is certainly the only doctrine which their principles leave room for. A certain event either will happen or it will not. There is nothing now in existence to constitute the truth of its being about to happen, or of its being about not to happen, unless it be certain circumstances to which only a law or uniformity can lend efficacy. But that law or uniformity, the nominalists say, has no real being; it is only a mental representation. If so, neither the being about to happen nor the being about not to happen has any reality at present; and the most that we can say is that the disjunction is true, but neither of the alternatives. If, however, we admit that the law has a real being, not of the mode of being of an individual, but even more real, then the future necessary consequent of a present state of things is as real and true as that present state of things itself.

By the old logicians, possibility is usually

defined as non-repugnancy to existence. Kant defines it as that which satisfies the formal conditions of experience (*Krit. d. reinen Vernunft*, 1st ed., 218, 234).

The possible proposition, or problematic judgment, as it is called by German logicians, is said by many logicians, especially Sigwart, not to be any proposition at all, because it does not draw a sharp line between truth and falsity. It seems to be necessary to distinguish between a proposition which asserts that under such and such general conditions a certain thing is possible, of which an example is the proposition that of any two collections one is not greater than the other, and a proposition which pretends to be no more than a conjecture. If a conjecture can be absolutely baseless, which may be doubted, a proposition which pretended to be no more than that may be said to be no proposition at all. But it can hardly be maintained that when Poincaré says that there is no physical law whatever which will not be rendered more certain by every new confirmatory experiment, he is depriving those laws of all meaning as propositions.

Logical possibility: that of a hypothesis not involving any self-contradiction.

Mere possibility: that of a state of things which might come to pass, but, in point of fact, never will. In common language, exaggerated to the 'merest possibility.'

Metaphysical possibility ought to mean a possibility of existence, nearly a potentiality; but the phrase does not seem to be used in that sense, but rather in the sense of possibility by supernatural power.

Moral possibility one might expect should be the opposite of moral impossibility, meaning, therefore, something reasonably free from extreme improbability. But, in fact, it seems to be used to mean what is morally permissible.

Physical possibility: (1) that which a knowledge of the laws of nature would not enable a person to be sure was not true; (2) that which might be brought about if psychological and spiritual conditions did not prevent, such as the Pope's pronouncing *ex cathedra* as an article of faith the fallibility of all his own utterances.

Practical possibility: that which lies within the power of a person or combination of persons under external conditions likely to be fulfilled, and questionable chiefly because internal conditions may not be fulfilled.

Proximate possibility. It is very difficult

to make out what is meant by this; but the phrase is evidently modelled on *potentia proxima*, which is a state of high preparedness for existence; so that proximate possibility would be a high grade of possibility in a proposition amounting almost to positive assertion.

Real possibility is possibility in the thing, as contradistinguished from mere logical possibility (Scotus, *Opus Oxon.*, I. ii. 7, *Ad secundam probationem maioris*).

Remote possibility: the possibility of a proposition which is far from being positively asserted. Also used in common speech.

Substantive possibility: the admissibility of a pure hypothesis (as illustrated above). (C.S.P.)

Post hoc, ergo propter hoc [Lat.]: see FALLACY.

Postpredicament [Lat. *postpraedicamentum*]: Ger. *Postprädicament*; Fr. *postprédicament*; Ital. *categorie postume*. One of five relations which are considered by Aristotle in the book of *Praedicamenta*, or *Categories*, after he has disposed of the predicaments themselves. They are *opposita* (ἀντικείμενα, in cap. x, xi) of four kinds (see OPPOSITION, in logic), *prius* (πρότερον, in cap. xii) of five kinds (see PRIOR), *simul* (ἅμα, in cap. xiii) of two kinds, *motus* (κίνησις, in cap. xiv) of six kinds, and *habere* (ἔχειν, in cap. xv) of eight kinds (see POSSESSION).

Abelard gave a special meaning to this word (for which see Prantl, *Gesch. d. Logik*, ii. 169), and also added Antepredicament. (C.S.P.)

Post-selection [Lat. *post + selectus*, chosen]: foreign equivalents are not in use. Natural selection of a structure, function, habit, or instinct, effected at a period in the life-history of the individual subsequent to the period when the character selected appears or takes place.

Suggested by Minot. A structure appears in an embryo; but, not benefiting the embryo, selection cannot act until a later stage, in which further development has rendered the structure useful. A parasitic wasp lays an egg in a larva, but without benefit to herself; but the benefit by which selection acts appears in the life of the offspring. These illustrations make the term clearer. Most natural selection is post-selection.

Literature: MINOT, Biol. Centralbl., xv. (1895) 584 (trans. in Amer. Natural., 1895); CH. DARWIN, *Origin of Species* (1859). (C.S.M.)

Postulate [Lat. *postulatum*, begged, used to translate Gr. αἴτημα]: Ger. *Voraussetzung* (the German *Postulat* = *Forderung* is a very different idea from that properly expressed by

the French and English words); Fr. *postulat*; Ital. *postulato*. (1) The earliest definition we have of postulate, which was a technical term of Greek geometers, is by Aristotle. The passage has an appearance of incoherence; it is, however, plain that Aristotle makes a distinction between *hypotheses* and *postulates* which Euclid does not draw, and which is irrelevant. Omitting the distinction, the two have this in common—that they are propositions not necessarily true which are assumed as the bases of deductions.

If we turn to the first book of Euclid's *Elements*, we observe, in the first place, that he calls axioms by the name of common notions, a deliberate choice by him, for Aristotle, before his day, had called them axioms, though Aristotle usually calls them *τὰ κοινά*, nearly Euclid's name. These matters of common knowledge, according to Euclid's enumeration of them, are not specially geometrical, except that magnitudes superposable are equal (see the *Cent. Dict.*, 'Axiom'). On the other hand, the 'postulates' of Euclid are all geometrical. They are as follows (according to the best MS. and all the evidence):—

(a) Between any two points a straight line can be drawn.

(b) Any terminated straight line can be prolonged at either end indefinitely.

(c) About any point in any plane as centre a circle may be described with any radius.

(d) All right angles are equal.

(e) If two straight lines in a plane are cut by a third, making the sum of the internal angles on one side less than two right angles, those two straight lines will meet if sufficiently produced.

(f) Two straight lines cannot enclose a space in a plane.

(2) Since Wolff it has been very common among Germans, and among English writers who follow them, to define a postulate as an indemonstrable practical proposition. That is to say, it is an indemonstrable *particular* proposition, asserting that some general description of an object *exists* (in the only sense in which pure geometrical forms can be said to exist), in contradistinction to *axioms*, which were supposed to be indemonstrable *theoretical* (i.e. universal) propositions, asserting that some general description of an object has no existence as a geometrical form.

It is certainly desirable to have two terms bearing these meanings; but it was an utter misunderstanding to suppose that such were

the proper meanings either of the word *axiom* or of the word *postulate*. The manner in which this misunderstanding came about is somewhat instructive. An axiom was a perfectly indubitable statement *about things*, in contradistinction to a definition, which cannot be called in question. On the contrary, a postulate was an indemonstrable proposition, not indubitable. There was some question whether certain postulates might not be considered to be axiomatic. When that was done, all the remaining postulates were particular propositions; namely, the first three of Euclid's list. This view was aided by the illogical notion that definitions could be considered as among the foundations of geometrical truth. Some writers went so far as to say that definitions were, or ought to be, the sole foundation of geometry—an extreme nominalistic position. But if definitions are allowed to take such a position, one postulate, at most, suffices, without any axiom; and all the rest of geometry can be thrown into a single definition. Namely, it is only necessary to postulate, say, that a point is possible, and to define a point in such a way as to make it cover the whole of geometry. This was not seen; and the practice of throwing geometrical truth over into definitions so far prevailed as to aid in restricting postulates to particular propositions. That such assumptions of possibility had a markedly different logical function from assumptions of impossibility was sufficiently clear to Wolff and the earlier writers whom he followed to cause him to put forth his definitions of *axiom* and *postulate*; and they recommended themselves all the more, because the postulates had become so familiar that it was no longer recognized that they were open to doubt.

(3) Kant calls his principles of modality 'postulates of empirical thought' in the sense of judgments which are objectively analytical but subjectively synthetical. In fact, the principles as stated by him are not synthetical in any sense whatever, but are mere definitions. (C.S.P.)

Potency: see POTENTIALITY, and POWER.

Potential [Lat. *potens*, capable]: Ger. *potentiell*; Fr. *potentiel*; Ital. *potenziale*. The POTENTIALITY (q.v.) of a thing is said to be potential or to exist potentially. (J.M.B.)

Potential (in physics): Ger. *Potential*, *Potentialfunktion*; Fr. *potentiel*; Ital. *potenziale*. A mathematical quantity or function whose value throughout any region of space in which given forces of attraction and repul-

sion act is determined by the condition that its difference of value between any two points is equal to the work done or energy gained by a unit particle in passing from one point to the other.

Potential energy: energy of position; a mathematical quantity expressing a condition, state, or relation of a system of bodies, such that energy may be generated by a change of that condition, state, or relation alone. See ENERGY. (S.N.)

Potentiality (1) and (2) **Potency** [Lat. *potens*, capable]: Ger. (1) *Potentialität*, (2) *Potenz*; Fr. (1) *potentialité*, *virtualité*, (2) *puissance*; Ital. (1) *virtualità*, (2) *potenza*. (1) That which a thing is judged capable of becoming or doing before it becomes or does it; that part of the entire meaning of a thing which is still prospective.

(2) Potency is used in two senses: (a) a concrete potentiality, i.e. towards a particular sort of becoming or doing, and (b) as equivalent to positive causal agency or power, especially in the adjective form 'potent.' See POWER.

The very obscure concept called potentiality has been used by almost every conceivable shade of thought as the repository of that which is unexplained. Aristotle started the pursuit of this notion and used it in a way which shed much light upon the questions of philosophy concerned with change and organization. Cf. GREEK TERMINOLOGY (6). With all the metaphysics of causation which the history of philosophy shows, there has been little effort to trace the psychological meaning of this category. How common it is to hear the expression, 'this thing exists, not actually, but potentially,' given as the end of debate, and accepted, too, as the end; yet the history of the subject would be mainly an exposition of a section of Aristotle's metaphysics with the refinements on Aristotle due to the logic of the schoolmen and the dogmatic of modern theology. It may suffice to say something of the natural history of the distinction between potential and real existence.

There are two aspects, under one of which reality must in all cases be viewed—the prospective and the retrospective. Cf. ORIGIN *versus* NATURE. The retrospective aspect sums up the history, which gives positive content to the notion of a thing considered as having an accomplished career. This aspect, it seems clear, is what is in view when we speak of real existence in contrast with potential existence. It is not indeed adequately rendered

by the content supplied by retrospect, since the fact that the two predicates are held in mind together as both together applicable to any concrete developing thing, forbids us to construe real existence altogether apart from the fact that it has a further issue in further career. It is a great merit of Aristotle that he forbade just this attempt to consider the *δύναμις* apart from the *ἐνεργεία*. But, nevertheless, it is true psychologically that real existence is exhausted as a content-predicate with the backward aspect of the series of changes which give content to reality.

And it seems equally evident that potential existence is concerned with the 'prospective' reference of the thought of things. That this is so is perhaps the one element in the notion of potentiality that all who use the word would agree upon. But this is inadequate as a description of the category of potentiality. For if that were all, how would it differ from any other thought of the prospective? We may think of the future career of a thing simple in terms of time; that, we should probably agree, does not involve potentiality. A particular potency is confined to a particular thing, i.e. to a particular series of events making up a more or less isolated career. If only the bare fact of futurity were involved, why should not any new unrolling of career be the potency of anything indiscriminately?

This leads us to see that potentiality, even when used in the abstract, is never free from its concrete reference. And this concrete reference is not that of conception in general, only or mainly; the concrete reference of conception generally is a matter of 'retrospect,' i.e. of the application of the concept to individual things, so far as such application has been justified by historical instances. Indeed, it is the very occurrence of the historical instances which has given rise to the concept, and it generalizes them.

So when we put ourselves at the point of view of the concrete, we have to ask what is actually meant by us when we say a thing exists potentially, over and above the mere meaning that the thing is to exist in the future. We have seen that one added element of meaning is that the thing which is to exist in the future is in some way tied down in its manifestations to something that already exists actually; it must be the potentiality of some one thing in order to be a potentiality at all. Now, how can this be?

Of course the ordinary answer is at once on

our lips: the answer that the bond between the thing that is and the thing that is to be is the bond of causation. The potentiality is the unexpressed causal efficacy of the thing that is. But when we come to ask what this means, we find that we are hiding behind one of the screens of common sense. The very fact of cause, whatever bond it may represent from an ontological point of view, is at least a fact of career. The effect is a further statement of the career of the thing called the cause. Now, to say that the potency of a thing is its unexpressed causal power, is only to say that the thing has not finished its career, and that is a part of the general notion of a thing. That fact alone does not in any way define the future career for us, except in the way of repetition of past career. We merely expect the thing to do what it has done before, not to become some new thing out of the old. In short, the category of causation is not adequate, since it construes all career retrospectively.

We have, therefore, two positions so far, saying (1) that every potency is the potency of a thing, and this means that it gets its content in some way from the historical series which that thing embodies; but (2) that it is something more than a restatement of any or all of the elements of the series thus embodied. Now, what else is there?

The remaining element in the category of potentiality involves, it seems, a very subtle movement of the mind along the same distinction of the prospective from the retrospective. Briefly, the potentiality which I ascribe to a thing is my general expectation of more career in reference to it, with the further expectation, based on the combined experiences of mine that the prospective does get a retrospective filling after it has happened, that the new career of the thing to which I ascribe the potency, although not yet unfolded, will likewise be capable of retrospective interpretation as further statement, although not a restatement, of the one series which now defines the thing. This is usually given content from analogous or imagined cases in which the career has been actually unfolded.

In short, there are three elements or phases of consciousness in this matter: first, let us say, the general prospective element, the expectation that something will happen; second, the causation or retrospective element, the expectation that when it has happened it will be a consistent part of the history of the

thing; and third, the conscious setting back of my observation at the dividing line between these two points of view, and the contemplation of the thing under both of them—both as a present thing and as a thing for what it will be when the future becomes present. For example: I say that a tree expresses the potency or potentiality of the seed. This means three concrete things. I expect the seed to have a future; I expect the future to be a tree—that is, a thing whose descriptive series is continuous with that already descriptive of the seed and analogous to the development of other trees—and, finally, I now look upon the seed as embodying the whole tree series now artificially present in my thought. (J.M.B.)

Poverty [Lat. *paupertas*]: Ger. *Armuth*; Fr. *pauvreté*; Ital. *povertà*. Failure to command the economic NECESSARIES (q.v.) for oneself and one's family.

If such failure is occasional, the poverty is occasional also; if the failure is continuous, the poverty is habitual.

Estimates of the rates of money income corresponding to different degrees of poverty (like the very valuable ones of Charles Booth) refer so far to local and temporary conditions that they hardly have use as permanent standards.

Poverty as here defined represents inadequacy of income. The term may also be used to denote absence of capital. If a man has a large income and spends it all he may be rich in one sense and poor in another. Most of the hasty generalizations about impoverishment are due to a careless use of these two meanings interchangeably. (A.T.H.)

Power [Late Lat. *potere*, for *posse*, to be able]: Ger. *Macht*, *Kraft* (this usually corresponds to force), *Vermögen* (faculty), *Potenz*; Fr. *puissance*, *pouvoir*; Ital. *potenza*, *potere*. Possibility of effecting or experiencing change, when this possibility is regarded as inherent in the agent or thing which is to act or be acted upon. Or, from another standpoint, it is the ground of an anticipated action or effect. It is, therefore, like CAUSE (q.v.) and FORCE (q.v.), one of the conceptions which are employed to explain change and preserve unity in our experience. Cf. POTENTIALITY.

Historically, it has been customary to speak of (1) active and (2) passive power. The conception of active power grows out of the attempt to unify still further the first member of the cause-effect relation, that of passive power out of the attempt to unify further the

second member. In considering a cause, the question arises why it begins to act. In certain cases this is explained by some external ground. In others—especially in the case of acts of a person—the ground is placed within. The external factor is neglected or regarded as merely the ‘occasion.’ Then since we cannot conceive the act as originating from nothing, we further unify our experience by relating the act to a permanent state of the agent or thing. As contrasted with force, it refers to the state preceding the activity, whereas force is one of the conceptions used to explain the activity itself. It is also commonly applied to the mental life, and here passes over into the more definite concept of FACULTY (q.v.). By the conception of ‘passive power’ the attempt is made to explain why a specific effect, such as melting in the case of wax, is produced by the same cause, heat, which produces an opposite effect upon other substances. This ground, we conceive, must lie in the thing acted upon. It is therefore not inappropriately termed a power, since it is an intrinsic state which determines (in part) the effect. Power is opposed, on the one hand, to actual activity; on the other, to the certainty of non-activity. It is therefore a mediating concept, framed to bridge the gap between non-action and action. By it we seek to think reality in such a way as to give a basis for explaining change. As such it was employed by Aristotle, who regarded all reality (except pure form) as at the same time actuality or entelechy, in so far as it is a complete, actual thing, or stage in a process; and also potentiality, in so far as it is to become something else (*ἐν ἐντελεχείᾳ*, and *ἐν δυνάμει*). The Latin *potentia* in mediaeval usage emphasized especially the opposition to actuality. Locke uses ‘power’ in the sense of the definition given above; but Leibnitz, in constructing the conception of his monads or entelechies, finds power (*puissance*) an inadequate concept, and conceives them as ‘forces,’ giving a metaphysical employment to the physical concept of ‘active force’ (*vis activa*), which modern dynamics was utilizing. Hume saw the subjective character of the concept of power and its affiliation with the concepts of force and necessary connection, and denied that we have any such idea in the sense of an objective entity, although elsewhere defining it as ‘the possibility or probability of any action, as discovered by experience.’ Modern physics does not use the conception, preferring the concept of ENERGY (q.v.), while modern logic

devotes itself rather to the concepts of cause and necessity. The reason for this is perhaps found in the fact that power is too psychological a term for the physicist, and does not indicate so clearly its relative or synthetic character as cause. It is appropriately applied to ‘money,’ which is an objective entity, but gets actual value only in reference to a purchase of goods, which is conceived as depending on some agent’s choice.

Ess.*, ii. 21; and *De Primæ Philos. Emend.*; WOLFF, *Ontologia*, §§ 716 ff.; HUME, *Treatise*, i. 3. 14, ii. 1. 10; REID, *Active Powers*, *Essay I*; HAMILTON, *Met.*, x. (J.H.T.)

Power (consciousness of) [Lat. *potens*, able, through Fr.]: Ger. *Kraftbewusstsein*; Fr. *sens de pouvoir*; Ital. *coscienza di potere*. The awareness that the occurrence or non-occurrence of an event depends, or seems to depend, on our mental activity, either directly or mediately through bodily activity.

Consciousness of power has often been regarded by psychologists as a primary source, or the sole source, of the concept of efficiency which is essential to the causal relation. This psychological doctrine may be combined with a denial that the concept of ‘efficiency’ thus acquired can stand the test of epistemological criticism. But in general, those who lay stress on subjective consciousness of power as the original experience from which the concept is derived also find in this experience the justification of its validity. It is important to note that the derivation of the concept of ‘efficient causation’ from the ‘sense of power’ is only a special form of the theory which derives it from subjective activity. It may be held that its ultimate source lies in the experience of subjective activity as such, whether this is or is not accompanied by consciousness of success or secure presumption of success. Striving or conation by its intrinsic nature tends to bring about a certain kind of result, the result sought or striven after. This holds good whether other circumstances do or do not permit actual attainment of the end. The striving *qua* striving does its part towards its own satisfaction, though other conditions may interfere with the result. This intrinsic connection between conation and satisfaction, between object sought and object

found, is often regarded as the ultimate of the concept of 'efficient cause' or of the 'causal nexus.' It must be admitted that from this point of view the term 'efficiency' is not well chosen. It is better to speak of 'activity' or 'agency.' But these words cover what is ordinarily meant by 'efficient causation.' See CAUSE AND EFFECT.

Great stress is laid by Groos (*Play of Man*, Eng. trans.) on consciousness of power as one of the conditions of the pleasure of play in animals and men. He constantly refers to 'joy in being a cause.' Animals and children show great delight in finding themselves able to produce impressive results. A monkey, for instance, will push over a chair again and again, rejoicing in the clatter that follows; and a child takes delight in throwing his spoon to the floor as often as the patient nurse is willing to pick it up. (G.F.S., J.M.B.)

Literature: power figures in the writings of the French realists LAROMIGUIÈRE, ROGER COLLARD, MAINE DE BIRAN, COUSIN, JANET, as in the Scottish philosophers REID, McCOSH. Cf. also BERTRAND, *Sens de l'Effort*. See the *Literature of CAUSATION*. (J.M.B.)

Powers (mental): see FACULTY.

Practical [Gr. *πρακτικός*, from *πράττειν*, to do]: Ger. *praktisch*, *Geistes-(wissenschaften, &c.)*; Fr. *pratique, moral*; Ital. *pratico, morale*. Pertaining to the sphere of values, worths, or ideals in the widest sense. See WORTH.

It covers all that is not theoretically or cognitively determined, but which involves purpose, teleology, striving, achievement, appreciation, ideals. The practical sphere is that of the 'fortune morale,' of the moral sciences, of ethical and aesthetic values. Cf. PRACTICAL REASON, PRACTICAL JUDGMENT, PRACTICE, and PRAGMATISM.

In the other languages, as in English, the popular usage limits the word to affairs of action; and in philosophy it is often applied specifically to the ethical, as in Kant's *Kritik der praktischen Vernunft*. If this last usage be followed, it makes practical, moral, and ethical all synonymous, and deprives us of a word in the sense of the definition. The obvious difficulty in adopting the usage suggested, however, is in bringing aesthetic contemplation and judgment under the connotation of practical. Yet the ethical and aesthetic together embody ideal values, and this would seem to justify it. (J.M.B., G.F.S.)

Practical Judgment: Ger. *praktisches Urtheil*; Fr. *jugement pratique*; Ital. *giudizio pratico*. (1) JUDGMENT (q.v.) exercised on

matters of will and action, e. g. judgment of fitness of means to ends. Cf. PRACTICAL, and PRAGMATIC.

(2) Judgment as to suitability, workability, fitness of any sort, as the practical judgment of the inventor, and the 'tact' of the social leader.

In this sense it is by practical judgment that one 'sizes up' a situation of any sort and arranges or rearranges its elements. It is broader than (1). The usage (2) is recommended. (J.M.B., G.F.S.)

(3) A function of PRACTICAL REASON (q.v.).

According to Kant, the question 'whether an action which is possible to us in the world of sense comes under the rule [of the practical reason] is a question to be decided by the practical judgment, by which what is said in the rule universally (*in abstracto*) is applied to an action *in concreto*.' The practical judgment cannot, like the theoretical, provide for the idea of reason, a 'schema' of sensibility; it can, however, provide a law—'such a law as can be exhibited *in concreto* in objects of the senses.' This law Kant calls the moral 'type,' and it runs: 'Ask yourself whether, if the action you propose were to take place by a law of the system of nature of which you were yourself a part, you could regard it as possible by your own will.' We thus 'use the system of the world of sense as the type of a supersensible system of things' (*Krit. d. prakt. Vernunft*, ed. Rosenkranz, 190-4; Abbott's trans., 159-63). (J.S.)

Practical Reason: Ger. *praktische Vernunft*; Fr. *raison pratique*; Ital. *ragione pratica*. (1) The function of reason or thought in matters of voluntary decision; and since voluntary acts and attitudes exhaust the ethical, frequently limited to the latter. See REASON (2), and cf. PRACTICAL, and PRACTICAL JUDGMENT (1).

The term has all the obscurity of the word reason in its relation to cognition in general or to thought. The definition leaves open the question of principles of 'reason' implicit in the exercise of thought, whether themselves capable of genetic determination or not. (J.M.B.)

(2) Reason as the source of *a priori* principles of moral practice.

In its practical use, according to Kant, 'reason is concerned with the grounds of determination of the will. . . . For here reason can at least attain so far as to determine the will, and has always objective reality in so far as it is the volition only that is in question.' Kant makes the autonomy of the will, or its

determination by pure practical reason, the basis of his ethics: this he calls its freedom. 'The critique of practical reason generally is bound to prevent the empirically conditioned reason from claiming exclusively to furnish the ground of determination of the will' (*Critique of Practical Reason*, Introd.). (J.S.)

Practical Religion: Ger. *praktische Religion*; Fr. *religion pratique*; Ital. *religione pratica*. That department of PRACTICAL THEOLOGY (q. v.) which has for its aim the upbuilding of the religious life in the community and the individual. Practical religion embodies itself in practical activities and in writings adapted to the religious needs of the time. (A.T.O.)

Practical Theology: Ger. *praktische Theologie*; Fr. *théologie pratique*; Ital. *teologia pratica*. That department of theology which treats of the corporate life of the Church, in its functions of government, edification, and worship.

Since Schleiermacher, who raised this discipline to its true dignity, practical theology has held a place co-ordinate with the exegetical, historical, and systematical branches. Of the three modes in which organic Christian life expresses itself—creed, code, and cult—practical theology in the broad sense would embrace the two latter. It includes homiletics as one of its departments, though the latter term is sometimes used as its equivalent, covering the subject of catechetics, liturgics, and polity.

Literature: NITSCH, *Prakt. Theol.*; BICKERSTETH, *Christian Student's Biblical Assistant*. (A.T.O.)

Practice (or Praxis) (in ethics) [Gr. *πρᾶξις*]: Ger. *Praxis*; Fr. *pratique*; Ital. *condotta*, (*la*) *praxis*. Conduct, or moral activity, as distinguished from the strictly intellectual life.

Aristotle distinguishes practice (*πρᾶξις*) from (1) theory or science (*ἐπιστήμη*), and (2) production (*τέχνη*). Unlike the former, it implies the presence of irrational desire, and consists in the regulation of the latter by reason; unlike the latter, it is its own end, and produces nothing beyond itself, i. e. it is AUTOTELIC (q. v.). (J.S.)

Practice (in psychology): Ger. *Uebung*; Fr. *pratique*; Ital. *pratica*. (1) Any sort of activity considered as preparing for (see PREPARATION), habituating (see HABITUATION), or exercising in (see EXERCISE) the function or functions brought into play.

Practice applies to mind or body and covers the three special cases distinguished

in the definition, for each of which foreign equivalents are given sub verbis.

(2) Used for repetition in general, together with its effects, in REACTION TIME (q. v.) experimentation. Cf. Wundt, *Physiol. Psychol.* (4th ed.), i. 356.

Literature: that of FATIGUE (e. g. HENRI, *Année Psychol.*, iii), and of REACTION TIME (e. g. ANGELL and MOORE, *Psychol. Rev.*, iii. 1896, 245; BUCCOLA, *Legge del tempo*, 1883, chap. vi). See also PLAY (especially the 'practice theory' as developed by GROOS, *Play of Animals*, Eng. trans.). (J.M.B., G.F.S.)

Practice Theory (of play): see PLAY.

Pragmatic (1) and (2) Pragmatism [Gr. *πραγματικός*, versed in affairs]: Ger. *pragmatisch*, *Pragmatismus*; Fr. *pragmatique*, *pragmatisme*; Ital. *prammatico*, *pragmatismo*. (1) This term is applied by Kant to the species of hypothetical imperative which he otherwise denominates 'counsel of prudence,' and characterizes as 'assertorial,' those, namely, which prescribe the means necessary to the attainment of happiness, an end which we may postulate for all sentient beings (*Grundlegung z. Met. d. Sitten*, ed. Rosenkranz, 42; Eng. trans., Abbott, 34). (J.S.)

Pragmatic anthropology, according to Kant, is practical ethics.

Pragmatic horizon is the adaptation of our general knowledge to influencing our morals.

(2) The opinion that metaphysics is to be largely cleared up by the application of the following maxim for attaining clearness of apprehension: 'Consider what effects, that might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object.' (C.S.P.)

The doctrine that the whole 'meaning' of a conception expresses itself in practical consequences, consequences either in the shape of conduct to be recommended, or in that of experiences to be expected, if the conception be true; which consequences would be different if it were untrue, and must be different from the consequences by which the meaning of other conceptions is in turn expressed. If a second conception should not appear to have other consequences, then it must really be only the first conception under a different name. In methodology it is certain that to trace and compare their respective consequences is an admirable way of establishing the differing meanings of different conceptions. (W.J.)

This maxim was first proposed by C. S. Peirce in the *Popular Science Monthly* for January, 1878 (xii. 287); and he explained how it was to be applied to the doctrine of reality. The writer was led to the maxim by reflection upon Kant's *Critic of the Pure Reason*. Substantially the same way of dealing with ontology seems to have been practised by the Stoics. The writer subsequently saw that the principle might easily be misapplied, so as to sweep away the whole doctrine of incommensurables, and, in fact, the whole Weierstrassian way of regarding the calculus. In 1896 William James published his *Will to Believe*, and later his *Philos. Conceptions and Pract. Results*, which pushed this method to such extremes as must tend to give us pause. The doctrine appears to assume that the end of man is action—a stoical axiom which, to the present writer at the age of sixty, does not recommend itself so forcibly as it did at thirty. If it be admitted, on the contrary, that action wants an end, and that that end must be something of a general description, then the spirit of the maxim itself, which is that we must look to the upshot of our concepts in order rightly to apprehend them, would direct us towards something different from practical facts, namely, to general ideas, as the true interpreters of our thought. Nevertheless, the maxim has approved itself to the writer, after many years of trial, as of great utility in leading to a relatively high grade of clearness of thought. He would venture to suggest that it should always be put into practice with conscientious thoroughness, but that, when that has been done, and not before, a still higher grade of clearness of thought can be attained by remembering that the only ultimate good which the practical facts to which it directs attention can subserve is to further the development of concrete reasonableness; so that the meaning of the concept does not lie in any individual reactions at all, but in the manner in which those reactions contribute to that development. Indeed, in the article of 1878, above referred to, the writer practised better than he preached; for he applied the stoical maxim most unstoically, in such a sense as to insist upon the reality of the objects of general ideas in their generality.

A widely current opinion during the last quarter of a century has been that reasonableness is not a good in itself, but only for the sake of something else. Whether it be so or

not seems to be a synthetical question, not to be settled by an appeal to the principle of contradiction—as if a reason for reasonableness were absurd. Almost everybody will now agree that the ultimate good lies in the evolutionary process in some way. If so, it is not in individual reactions in their segregation, but in something general or continuous. Synechism is founded on the notion that the coalescence, the becoming continuous, the becoming governed by laws, the becoming instinct with general ideas, are but phases of one and the same process of the growth of reasonableness. This is first shown to be true with mathematical exactitude in the field of logic, and is thence inferred to hold good metaphysically. It is not opposed to pragmatism in the manner in which C. S. Peirce applied it, but includes that procedure as a step. (C.S.P.)

It is of course legitimate to demand a reason for reasonableness; to do so is only to ask why we think—a question to which a genetic answer would seem to be afforded by certain forms of pragmatism. We may say (cf. SELECTION, in psychology) that reasonableness, or truth, is due to practical adjustments, and that the system of truths is developed by the selection of concrete relationships which 'work.' But it is quite another thing to make this genetic account of the origin and selection of 'truth' a philosophy of reality. For just the general or universal meaning of the system as a whole, the purpose or function which the concrete items selected as 'workable' subserves, and the environment or real world in which the entire movement takes place—all these are by definition outside the sphere of operation of pragmatism. Pragmatism is really an attempt to construe all reality 'retrospectively'—as adequately given in the system of concrete practically derived truths—i.e. as empirical 'science'; and while nominalism may invoke it, it still remains to prove nominalism. Cf. what is said under ORIGIN *versus* NATURE. In the words of Peirce (comment on this article): 'Nominalism, up to that of Hegel, looks at reality retrospectively. What all modern philosophy does is to deny that there is any *esse in futuro*.' Urban (*Psychol. Rev.*, July, 1897) holds that while the concrete details of empirical knowledge may be due to 'utility selection'—as practical 'workables'—yet the structural principles of thought cannot be so accounted for. They have no application as *generals*, and so would

have to the pragmatist no adequate 'reason for being.'

The definition by W.J. above, however, seems, by including 'experiences to be expected,' to broaden the application of the principle.

Literature: besides the works of PEIRCE and JAMES, as cited, see CALDWELL, *Pragmatism*, in *Mind*, Oct., 1900; MILLER, *Philos. Rev.*, viii. (1899) 166; cf. CLIFFORD, *Lect. and Essays* (1886), 85 ff.; also the literature of SELECTIVE THINKING. (J.M.B.)

Praiseworthy: Ger. *preiswürdig*, *lobenswerth*; Fr. *méritoire*; Ital. *lodevole*. See APPROBATION, MERIT, and WORTH.

Prayer (rite of) [Lat. *precarius*, from *precari*, to beseech]: Ger. *Gebet*; Fr. *prière*; Ital. *preghiera*. The most characteristic form of worship, and consisting in spoken or unspoken petitions to the object of worship, and accompanied ordinarily with praise, confession, and thanksgiving. (A.T.O.)

Pre- and Post-millenarianism: see MILLENARIANISM. *Pre-millenarianism*: the belief that the second coming of Christ is to precede the millennial era, and that he is to reign in person on earth during that period.

Post-millenarianism: the belief that the second advent will occur at the close of the millennial period and be followed by the general resurrection and the last judgment.

Literature: see references under MILLENARIANISM. (A.T.O.)

Precise [Lat. *praecisus*, abridged through Fr.]: Ger. *präcis*; Fr. *précis*; Ital. *preciso*. (1) Having that element of accuracy which consists in strict curtailment of superfluity. A precise narrative is one from which subjective interpolations have been rigidly excluded. A precise definition is one from which inessential characters are excluded. The definition of a circumference as 'an untermimated line in a plane, everywhere at the same distance from a point within,' will be rendered precise by cutting off the word 'within.' In English the word is used more vaguely than in French.

(2) In physics it means having a very small error in consequence of the conscientious application of the most refined methods of measurement.

(3) In older writers the adjective is sometimes applied to a noun to signify that that noun is to be understood in its precise sense, without reference to accidental characters often associated with it. (C.S.P.)

Precision [Lat. *praecisio*, through Fr.]:

Ger. *Präcision*; Fr. *précision* (in all the senses of the English word; but in the technical logical sense it is obsolete in Fr.); Ital. *precisione*. (1) A high degree of approximation, only attainable by the thorough application of the most refined methods of science.

(2) Its earlier meaning, still more or less used by logicians, is derived from a meaning given to *praecisio* by Scotus and other scholastics: the act of supposing (whether with consciousness of fiction or not) something about one element of a percept, upon which the thought dwells, without paying any regard to other elements. Precision implies more than mere discrimination, which relates merely to the essence of a term. Thus I can, by an act of discrimination, separate colour from extension; but I cannot do so by *precision*, since I cannot suppose that in any possible universe colour (not colour-sensation, but colour as a quality of an object) exists without extension. So with *triangularity* and *trilaterality*. On the other hand, precision implies much less than dissociation, which, indeed, is not a term of logic, but of psychology. It is doubtful whether a person who is not devoid of the sense of sight can separate space from colour by dissociation, or, at any rate, not without great difficulty; but he can, and, indeed, does do so, by *precision*, if he thinks a vacuum is uncoloured. So it is, likewise, with space and tridimensionality.

Some writers called every description of abstraction by the name *precision*, dividing precision into the real and the mental, and the latter into the negative and the positive; but the better usage named these *abstraction*, divided into *real* and *intentional*, and the latter into *negative* (in which the character from which abstraction is made is imagined to be *deniable* of the subject prescinded) and into *precise abstraction* or *precision*, where the subject prescinded is supposed (in some hypothetical state of things) without any supposition, whether affirmative or negative, in respect to the character abstracted. Hence, the brocard: *abstrahentium non est mendacium* (generally enunciated in connection with the *De Anima*, III. vii. 7). Scotus (in II. *Physic.*, *Expositio* 20 textus 18) says: 'Et si aliquis dicat, quod Mathematicis tunc faciunt mendacium: quia considerant ista, quasi essent abstracta a motu, et materia; quae tamen sunt coniuncta materiae. Respondet, quod non faciunt mendacium: quia Mathematicus non con-

siderat, utrum id, de quo demonstrat suas passiones, sit coniunctum materiae, vel abstractum a materia.' This is not the place to treat of the many interesting logical, as well as psychological, discussions which have taken place concerning precision, which is one of the subjects which the scholastics treated in a comparatively modern way, although it leads directly to the question of nominalism and realism. It may, however, be mentioned that Scotus in many places draws a certain distinction variously designated by him and his followers (its nature and application is perhaps made as clear as anywhere in the *Opus Oxon.*, III. xxii. qu. unica, 'Utrum Christus fuerit homo in triduo,' i.e. between the crucifixion and the resurrection), which the Thomists mostly dispute. There is some account of the matter in Chauvinus, *Lexicon* (2nd ed.), under 'Praecisio.'

Hamilton has some remarks on the use of the words *abstract* and *prescind*, which could hardly come from any other man of equal learning and power, because no other such man is liable to be utterly confused by a slight complication. The remarks are mentioned here, because they have misled some students (*Lects. on Met.*, xxxv; *Lects. on Logic*, vii).

Precocity [Lat. *praecox*, early, ripe]: Ger. *Frühreife*, *Altklugheit*; Fr. *précocité*; Ital. *precocità*. The relatively early development of a physiological or psychological function.

Wherever the time of appearance or the rate of development of a given power has been measurably determined, any marked anticipation of this period or development may properly be termed precocity. Infants may thus be precocious in their acquisition of the power to walk or to speak, and the like. There may also be a special precocity of the musical sense, of artistic capacity, of motor skill, &c. The term is most frequently used with regard to general intellectual attainments in early years. Instances of unusual precocity in the lives of men of genius are readily cited, and have led to the discussion of the general relations between precocity and genius (see Galton, *Hereditary Genius*). It is also stated that precocious children occur relatively often in families some of whose members present neurotic traits, and are themselves liable to mental disorder. Cf. GENIUS. (J.J.)

Preconception [Lat. *prae* + *conceptio*]: Ger. *Vorbegriff*; Fr. *préconception*; Ital. *pregiudizio*. (1) Used vaguely and popularly for anticipation with reference to a particular

idea or event which, carrying the suggestion of prejudgment or mental bias, is said to be preconceived.

(2) The term might well serve a technical use as designating the mental process of a dispositional or notional character preliminary to the determination of a concept. See CONCEPTION. (J.M.B.)

Predesignate [a word formed by Sir W. Hamilton by composition from Lat. *prae*, in front of, and *designatus*, marked out]: (not in use in the other languages). (1) A term applied by Hamilton to verbal propositions whose quantity, as universal or particular, is expressed (*Lects. on Logic*, xiii).

(2) By C. S. Peirce applied to relations, characters, and objects which, in compliance with the principles of the theory of probability, are in probable reasonings specified in advance of, or, at least, quite independently of, any examination of the facts. See PROBABLE INFERENCE (2).

For example, the laws of England will, in the long run, cause the majority of English sovereigns to be males. In that sense it was unlikely that the successor of William IV would be a queen. But it would be absurd to say this after knowing that there was no heir to the crown so near as the Princess Victoria; and, in like manner, to say that it was not very unlikely that Queen Victoria's successor would be a queen was true enough as long as the character of her progeny was not known, or, if known, was not taken account of, but false considering the number of her sons and grandsons. In such cases of deductive probable inference the necessity of the predestination is too obvious to be overlooked. But in indirect statistical inferences, which are mere transformations of similar deductive consequences, and the validity of which, therefore, depends upon precisely the same conditions, the necessity of the predestination is more often overlooked than remarked. Thus Macaulay, in his essay on the inductive philosophy, collects a number of instances of Irish whigs—which we may suppose constitute a random sample, as they ought, since they are to be used as the basis of an induction. By the exercise of ingenuity and patience, the writer succeeds in finding a character which they all possess, that of carrying middle names; whereupon he seems to think that an unobjectionable induction would be that all Irish whigs have middle names. But he has violated the rule, based on the theory of probabilities, that the

character for which the samples are to be used as inductive instances must be specified independently of the result of that examination. Upon the same principle only those consequents of a hypothesis support the truth of the hypotheses which were predicted, or, at least, in no way influenced the character of the hypothesis. But this rule does not forbid the problematic acceptance of a hypothesis, which has nothing to do with the theory of probability. (C.S.P.)

Predestination [Lat. *praedestinatio*, a determining beforehand]: Ger. *Prädestination*; Fr. *prédestination*; Ital. *predestinazione*. The aspect of the divine foreordination which applies to moral agents as predetermining either their election to eternal life or their reprobation. See FOREORDINATION. (A.T.O.)

Predetermination [Lat. *prae + determinatus*, limited]: Ger. *Predetermination*; Fr. *prédétermination*; Ital. *predeterminazione*. (1) DETERMINATION (q. v.; especially psychical, ad fin.) beforehand. (2) PREDESTINATION or FOREORDINATION (q. v.). (J.M.B.)

Predeterminism: DETERMINISM (q. v., various topics).

Predicable [Lat. *praedicabilis*, meaning in classical Lat. praiseworthy]: Ger. *Prädicabilien* (pl.); Fr. *prédicable*; Ital. *predicabile*. One of the five logical kinds of predicates of the early peripatetic school: genus, species, difference, property, accident (γένος, εἶδος, διαφορά, ἴδιον, συμβεβηκός), also called the *quinque voces* or *modi praedicandi*.

The indications, at present, are that the word was first used in the logical sense in translations from the Arabic. For Albertus Magnus, who did little more than report the views of Arabians, explains at considerable length the appropriateness of the term, as if it were a new one (*In praedicabilibus*, tr. ii. cap. i). It was, however, probably earlier that it was used by Lambert of Auxerre (Prantl, *Gesch. d. Logik*, iii. 28, note 114), who gives somewhat similar explanations.

Persons beginning the study of logic had better give such time as is necessary to reading the *Isagoge* of Porphyry, one of the best executed pieces of logical exposition that ever was written, superior in that respect to anything in the *Organon*, except the first book of the *Prior Analytics*. There seems to be nothing in the book which is not in Aristotle. A few sentences in the first part of the *Topics* (I. iv. 2) virtually contain the whole matter, which in the following chapter is put together

substantially as Porphyry unites it. Still, it must be admitted that the mode of colligation is here no small matter. Before Porphyry, Apuleius has stated the doctrine nearly as well, and Prantl thinks he can detect it in its matured form even in Theophrastus; but this claim is excessive. One is inclined to think that the author who expounded the doctrine with such remarkable vigour must have thought it out for himself.

The school definitions of predicable are all very bad. That of Burgersdicius is: 'Predicables are what are affirmed of many truly, properly, naturally, and immediately.' Blundevile says: 'Predicables are certayne degrees, or rather pedigrees of words that be of one affinity, shewing which comprehend more, and which comprehend lesse.' Most of the books define universals instead of predicables, or say that predicables differ from universals only in being spoken of a subject instead of being in a subject. It is easy to see that this does not answer. A universal is 'aptum natum dici de pluribus.' Such is any general term, as *man*. But the five terms genus, species, difference, property, accident, are surely not ordinary class names. Some say they are second intentions. This is very good indeed, so far as it goes; but it is not sufficiently definite.

Kant undertook to set up his own 'predicables of the pure understanding,' which were to be derivative conceptions under the categories (*Krit. d. reinen Vernunft*, 1st ed., 82). (C.S.P.)

Predicament [the Eng. form of the Lat. *praedicamentum*, translating Gr. κατηγορία, category (Aristotle)]: Ger. *Praedicament*; Fr. *catégorie*; Ital. *categoria*. As a term of philosophy, predicament is exactly equivalent to CATEGORY (q. v.). Cf. Trendelenburg, *Beitr. z. Logik*; Baldwin, *Handb. of Psychol.*, i. chap. xiv. § 4; Peirce, *Proc. Amer. Acad. Arts and Sci.*, May, 1867. (C.S.P.)

Predicate [Lat. *praedicatum*, from *prae + dicare*, to make public; used in Latin since Boethius, A. D. 500, in the logical sense. It was used by Boethius to translate κατηγορημα, κατηγορούμενον, or τὸ ὅ of a proposition. *Praedicatio*, owing to its familiarity in the sense of preaching, was a little later in becoming a term of logic]: Ger. *Prädikat*; Fr. *attribut, prédicat*; Ital. *predicato*. (1) That element of a PROPOSITION (q. v.) which is brought in to relation to the SUBJECT (q. v.). Cf. also JUDGMENT, and REASONING. (J.M.B.)

(2) The view which pragmatic logic takes

of the predicate, in consequence of its assuming that the entire purpose of deductive logic is to ascertain the necessary conditions of the truth of signs, without any regard to the accidents of Indo-European grammar, will be here briefly stated. Cf. NEGATION.

In any proposition, i.e. any statement which must be true or false, let some parts be struck out so that the remnant is not a proposition, but is such that it becomes a proposition when each blank is filled by a proper name. The erasures are not to be made in a mechanical way, but with such modifications as may be necessary to preserve the partial sense of the fragment. Such a residue is a *predicate*. The same proposition may be mutilated in various ways so that different fragments will appear as predicates. Thus, take the proposition 'Every man reveres some woman.' This contains the following predicates, among others:

' ——— reveres some woman.'

' ——— is either not a man or reveres some woman.'

' Any previously selected man reveres ———.'

' Any previously selected man is ———.'

See NEGATION.

(C.S.P.)

Predication [Lat. *praedicare*, to assert]: Ger. *Aussage*, *Prädikation*; Fr. *attribution*, *détermination*; Ital. *affermazione*. (1) In psychology: the determination of a conceptual whole by the process of consciously including within it, or excluding from it, a new conceptual element.

The essential mark of the subject-predicate relation is that it constitutes that advance in thought which is expressed or expressible in a sentence. Thus we find that grammarians distinguish between the merely defining or determining use of adjectives, participles, &c., and their predicative or declarative function. To explain the nature of the subject-predicate relation is also to explain why discourse is broken up into distinct sentences. The required explanation is not far to seek, if we start from the popular use of the word subject as indicating the general topic or universe of discourse. The predicate of the subject, in this sense, is the whole discourse through which it receives determination and specification. Predication, from this point of view, consists just in the gradual definition and specification of what is at the outset relatively indefinite and indeterminate. It is because this process takes place gradually by a successive concentration of attention that language

is divided into sentences. 'The predicate of a sentence is the determination of what was previously indeterminate. The subject is the previous qualification of the general topic or universe of discourse to which the new qualification is attached. . . . Sentences are, in the process of thinking, what steps are in the process of walking. The foot on which the weight of the body rests corresponds to the subject. The foot which is moved forward to occupy new ground corresponds to the predicate' (Stout, as cited below, ii. 213). Symbolically, the process may be represented as follows: $a = ab$, $ab = abc$, $abc = abcd$, and so on, a formula suggested by Baldwin for such a 'conceptual interpretation' of the thinking processes. In continuous thought, so far as it is continuous, all determinations of the general topic which have emerged up to a certain point form an integral part of the subject, to which all subsequent determinations are attached as predicates. Consider the following: 'I took the train to London; I arrived at 12 p.m.; I went to an hotel; I found that all the rooms were taken.' The 'I,' which is the grammatical subject of the last sentence, is qualified by those which preceded. The full sentence is: 'I, having taken the train to London, and having arrived at 12 p.m., on going to an hotel found that all the rooms were taken' (Paul, *Princ. of the Hist. of Language*, Eng. trans., 144 ff.). See the adjacent topics, and cf. JUDGMENT.

Literature: BALDWIN, *Handb. of Psychol., Senses and Intellect*, 283 ff.; STOUT, *Analytic Psychol.*, ii. 212 ff.; BOSANQUET, *Essentials of Logic*, 108 ff.; PAUL, as cited above, 144 ff.

(G.F.S., J.M.B., C.L.F.)

(2) In logic: the joining of a predicate to a subject of a PROPOSITION (q.v.) so as to increase the logical breadth without diminishing the logical depth.

On the relation between the psychological and the logical views of predication, see PROPOSITION (1).

This still leaves room for understanding predication in various ways, according to the conception entertained of the dissection of a proposition into subject and predicate. It is a question under dispute to-day whether predication is the essential function of the proposition. Some maintain that the proposition 'It rains' involves no predication. But if it is an assertion, it does not mean that it rains in fairyland, but the very act of saying anything with an appearance of seriously meaning it is an INDEX (q.v.) that forces the person

addressed to look about to see what it is to which what is being said refers. The 'rains' recalls to his mind an image of fine up-and-down lines over the field of view; and he looks sharply out of the window, fully understanding that that visible environment is indicated as the subject where the lines of falling drops will be seen. In like manner, there is a predication in a conditional or other hypothetical proposition, in the same sense that some recognized range of experience or thought is referred to. (C.S.P.)

So in all compound propositions, some recognized range of experience, thought, or belief is referred to, even though, in a given case, by an accident of language, we are permitted to completely suppress both subject and copula (cf. Baldwin, *Handb. of Psychol.*, i, chapter on Thought; Venn, *Empirical Logic*). Just as (1) 'Every a is b ' means 'Granted that any object is a , it may be safely concluded that it is also b ,' so (2) 'If a is b , c is d ' means 'For whatever time, place, or combination of circumstances you grant that a is b , you may also be sure that c is d '; and in particular, just as (1) is identical in logical import with 'Every object is either not a or else b ,' so (2) when expressed in the form 'Either a is not b or c is d ' has for its full meaning 'Time, place, and circumstance imply that a is not b or else that c is d ,' or, 'Whatever is, a is not b or c is d ,' or, 'What occurs is that a is not b or that c is d .' Hence in symbolic logic it is perfectly justifiable to use the same sign for the subject in both the simple and the compound proposition (and without regard to whether the subject is expressed or understood in common language):

$$(1) \quad \infty \leq \bar{a} + b$$

$$(2) \quad \infty \leq (a \leq b + (c \leq d)).$$

For the symbols used see PROPOSITION. (C.L.F.)

A few of the most frequently recurring scholastic phrases follow.

Abstract predication: predication of a subject considered in the abstract.

Accidental predication: predication of an accident.

Analogical predication: a rather favourite expression of Aquinas: predication in which the predicate is taken neither in its strict sense nor in an unrelated sense, but in a peculiar sense for which there is a good reason, as when a statue is said to be a man.

Complete predication: predication in which the whole nature of the thing is formally affirmed.

Denominative predication: predication in which that whose nature it is to be a subject is taken as the subject, and something whose nature it is to be predicated is taken as the predicate; a predication of an accident of a substance. (It is well discussed by Scotus, *In univ. Porph.*, 9, 16, 'Utrum haec sit vera, *Homo est animalis*,' where, as in the majority of scholastic disputations, the conclusion is foregone, and the interest lies in the formidable difficulties and how they are to be overcome.) Denominative predication, in its proper sense, is predication of an accidental concrete term of its own subject; in a broad sense, it is the predication of any concrete of a suppositum, or of any subject of less breadth; in the widest sense, it is predication of any predicate of any subject. Denominative predication may be *a posteriori* or *a priori*, as *homo est albus*, *rationale est substantia*, *homo est animal*.

Determinative predication: same as *denominative predication*.

Dialectic predication, as defined by Aristotle (*I. Top.*, x): the predication of a general term in a proposition which may result from an argument in a probable place, and not reducible to anything prior.

Direct predication: predication in the usual sense of representing that the breadth of the subject belongs to the predicate, and the depth of the predicate to the subject; or, in scholastic language, it is predication of a higher term of a lower one, of a passion of a subject, of an accident of a subject, of a mode of a quiddity, of a difference of a genus. See *Indirect predication*, below.

Equivocal predication: predication which may be taken in two unrelated senses.

Essential predication: in which the predicate is wholly contained in the essence of the subject. It is, therefore, in Kant's sense, an analytical judgment. But neither Kant nor the scholastics provide for the fact that an indefinitely complicated proposition, very far from obvious, may often be deduced by mathematical reasoning, or necessary deduction, by the logic of relatives, from a definition of the utmost simplicity, without assuming any hypothesis whatever (indeed, such assumption could only render the proposition deduced simpler); and this may contain many notions not explicit in the definition. This may be illustrated by the following: Man is a rational animal; hence, whatever is not a man is either, on the one hand, not rational, while either at the same time being an animal or else benefiting nothing except such objects as love

nothing but fairies, or, on the other hand, is not an animal, while either being rational or standing to whatever fairy may exist in the relation of benefitting something that loves it. Now, if it be said that that is an analytical judgment, or essential predication, neither the definition of the scholastics nor that of Kant is adequate. But if it be said that it is not an essential predication, or analytical judgment, then the accidental predication and the synthetical judgment may be a necessary consequence, and a very recondite one, of a mere definition, quite contrary to what either Kant or the scholastics supposed and built upon. Cf. Scotus (*In univ. Porph.*, 9. 12), whomakes essential predication the predication of genus, species, or difference.

Exercised predication. The distinction between exercised and signate predication belongs to Scotus. (The passage which Prantl attributes to Antonius Andreas is a quotation *verbatim* from Scotus, as often naturally happens in Prantl's *Geschichte*.) A *signate* predication is one which is *said to be made*, an *exercised* predication is one which *is made*; so that Scotus says: 'A praedicari signato ad praedicari exercitum non tenet consequentia per se in eisdem terminis.' Scotus gives the following examples of the distinction, where the exercised predication is marked E, the signate S: S, *Genus praedicatur de specie*; E, *Homo est animal*. (The Lyons text here transposes the terms, which we give correctly.) S, *nego*; E, *non*. E, *tantum*; S, *excludo*. The abstract definition of Scotus is: '*Esse in rebus primae intentionis illud exercet quod praedicari signat in secundis intentionibus*.' Exercised predication is distinguished into *praedicatio de proprio supposito* and *praedicatio de subiecto*; the former is essential, the latter accidental.

Formal predication: predication where the predicate is in the concept of the subject, independent of any extrinsic cause or of any particular matter *in qua*. The difference between formal and essential predication is somewhat trivial and confused.

Identical predication: the predication of a term of itself.

Incomplete predication: see *Complete predication*.

Indirect predication has two meanings. In one sense, it might better be called *relative predication*, since it is the predication of some term which occurs in the predicate in an oblique case, as angles are predicated of triangles. But, in another sense, Chau-

vinus (*Lexicon*, 2nd ed., 1713, 'Praedicatio') says: 'Praedicatio contra *naturam*, seu *inordinata*, quae alias etiam dicitur *indirecta*, ea est vel in qua inferius de superiori in eadem linea praedicamentali, aut id quod se habet per modum materiae de eo quod se habet per modum formae dicitur; . . . vel, in qua species de sua dicitur differentia . . . vel, in qua substantia dicitur de accidente connotativo.' Mauritius Hibernicus, in his *Expositio quaest. D. Subtilis in quinque Vniv. Porph.*, qu. i. art. 31, says, 'Voco communiter praedicationem directam,' and proceeds to give substantially the definition of Chauvinus.

Inordinate predication: see quotation from Chauvinus under *Indirect predication*.

Intrinsic predication: one in which the predicate is in the subject independently of the relations of the latter to other things.

Natural predication: when the subject and predicate ought to be so related according to their nature. This is substantially the definition given in many books; but it conveys little idea of how the expression is used. Natural predication is always divided into the identical and direct; non-natural predication is either *indirect*, i. e. *contra naturam*, or it is *praeter naturam*, i. e. *per accidens*. Examples of indirect predication, where the subject is related to the predicate as form to matter, are *alba est nix*, *animal est homo*. Examples of predication *praeter naturam*, where subject and predicate are related to some third term, as form to matter, are *album est dulce*, *dulce est album*. Examples of direct predication: *nix est alba*, *homo est animal*. Examples of identical predication: *gladius est ensis*, *Plato est Plato* (Conimbricenses in *Praef. Porph.*, q. i. art. 4).

Non-natural predication: see *Natural predication*.

Proper predication: a predication in which the verb and predicate are taken in their proper signification.

Qualificative predication: see *Predication in quale*.

Quidditative predication: see *Predication in quid*.

Signate predication: see *Exercised predication*.

Univocal predication: predication of a univocal term.

Predication de omni is defined by Aristotle in the *dictum de omni*; that is, what is predicated of a subject universally, or *de omni*, is predicated of everything of which that subject is predicated.

Predication in eo quod quid (translation of

Porphyry's *ἐν τῷ τὶ ἐστὶ κατηγορεῖσθαι* occurs in the translation of the *Isagoge* by Marius Victorinus, and means predication of the genus and species. In some of the late scholastics it is distinguished from other predication *in quid*, and is confined to predication of the *genus* (see Eckius, *In Petr. Hisp.*). But others, as the Mainz doctors, retain the earlier meaning.

Predication in eo quod quale: same as predication *in quale*, from which, however, some of the later writers discriminate it.

Predication in quale, as most commonly used, is predication of difference, property, or accident. But it is also, not infrequently, restricted to predication of the property or accident. Albertus Magnus (*In predicabilibus*, tr. iii. cap. iv) distinguishes four different senses of predication *in quale*.

Predication in quale quid: predication of a specific difference.

Predication in quid (the expression appears in the 12th century. It is an abbreviation of *in eo quod quid*). Used in a number of senses, for which see any good mediaeval logic; and especially for predication of the genus and species, most strictly of the latter.

Predication per accidens: see *Natural predication*.

Predication per causam: a predication that the predicate stands in a causal relation to the subject.

Predication per comitantiam or *concomitantiam*: a predication that the predicate accompanies the subject.

Predication per essentiam: essential predication.

Predication per se: see *PER SE*.

Predication quasi in quid = *in quale quid*. (C.S.P.)

Predicative Proposition. The old name for a categorical PROPOSITION (q.v., also CATEGORICAL), used by Apuleius, Marcianus Capella, and Boethius. Cassiodorus, however, has *categoricus*, which was used by Abelard and subsequent logicians. The expression has been revived by some modern logicians who do not think that all propositions, nor even all categorical propositions, such as 'It rains,' predicate anything. (C.S.P.)

Prediction [Lat. *praedictio*, a foretelling]: Ger. *Prophezeiung*; Fr. *prédiction*; Ital. *predizione*. (1) One of the functions of prophecy by virtue of which the prophet becomes a seer and reader of the future. See PROPHECY. (A.T.O.)

(2) In logic: see PREDESIGNATE (2), and cf. PROBABLE INFERENCE (2).

Predisposition [Lat. *prae + dispositio*]: Ger. *Prädisposition*, *Anlage*; Fr. *prédisposition*; Ital. *predisposizione*. An inherited tendency to act in certain ways. A predisposition is thus an inherited DISPOSITION (q.v.). (J.M.B.—G.F.S.)

We are thus making predisposition or inherited disposition subject to the distinction of the older usage, which contrasted DISPOSITION (q.v., meaning 2) with habit. Hamilton finds the contrast in the Greek terms *διθέσις* and *ἔξις* (*Metaphysics*, Mansel and Veitch, ed. N. Y., Lect. x. 124). The prefix of the latter term appropriately marks the innate character of predispositions. This meaning of predisposition covers the popular use of the term as referring to the permanent elements of character and endowment recognized as ingredients in temperament (noted by Aristotle, *Categories*, chap. viii; ref. supplied by eds. to Hamilton, in the passage quoted above). This also makes predisposition an adequate translation of *Anlage* (mental), following the translation of Groos' *Play of Man*, as against that of Külpe's *Outlines of Psychology*, in which disposition is used without qualification. (J.M.B., G.F.S.)

Predisposition (in medicine): Ger. *Prädisposition*; Fr. *prédisposition*; Ital. *predisposizione*. A physical or mental liability or susceptibility in a particular direction.

The word, like the terms bent, trait, temperament, diathesis, is an important one in the discussion of heredity and the distribution of endowment, to indicate an inborn tendency or capacity to develop readily in a given direction. Predisposition is used of general emotional and mental character rather than of individual traits; it is also frequently employed in regard to abnormal tendencies (see art. 'Predisposition in Disease,' in Quain's *Dictionary of Medicine*), such as a predisposition to neurasthenia, to hysteria, &c. In the discussion of the aetiology of a mental disorder the predisposing causes are always considered. See DIATHESIS. (J.J.)

Pre-established Harmony: Ger. *prästabilierte Harmonie*; Fr. *harmonie préétablie*; Ital. *armonia prestabilita*. The name given by Leibnitz to his theory (1) of the relation of the monads to one another; (2) of spirit to matter, of the soul to the body. The last is the commoner use, but is, relatively speaking, superficial.

The problem of the influence of mind upon body had been brought to the front by Descartes (see OCCASIONALISM). Leibnitz

holds that there is no actual influence exercised by one of them upon the other, nor does God interfere to produce change in one upon occasion of change in the other. But he has eternally harmonized the two so that changes in one synchronize with, and represent, changes in the other. Leibnitz uses frequently the comparison of two clocks which keep perfect time. The vulgar view would assume that some influence passed from one to the other; Occasionalism, that an outsider changes one when the other changes; this theory, that they were originally so perfectly harmonized that no departure of one from the other can take place. In its wider philosophic sense, pre-established harmony means that while each monad acts out its own nature undisturbed by any other, yet each is so constituted as to reflect, mirror, or represent, 'from its own point of view,' the entire universe. The active or developed side of each monad is spirit; its passive or undeveloped side is matter. The active gives the law to the passive, i. e. defines its end or idea. Hence the universal harmony of mind and matter, thought and extension—Leibnitz's dynamic interpretation of Spinoza's parallelism of the two attributes. Cf. the standard works on the history of philosophy. (J.D.)

Pre-existence [Lat. *prae + existens*, existing]: Ger. *Präexistenz*; Fr. *préexistence*; Ital. *preesistenza*. (1) Identical with TRANSMIGRATION (q. v.).

(2) The doctrine of certain Christians that the human soul of Jesus Christ existed prior to his conception in the flesh.

The advocates of this view teach that the human soul of Christ existed before the creation of the world, in union with his divine nature. This doctrine has always been held in connection with a belief in the Divinity of Christ. It has not had very much vogue, and has never risen to the dignity of a recognized heresy.

Literature: WATT, Works, v. 274-385; HAAG, Histoire des Dogmes Chrétiens; MÜLLER, Doct. of Sin; LIDDON, Divinity of Christ. (A.T.O.)

Preformation [Lat. *prae + forma*, shape]: Ger. *Präformation*; Fr. *préformation*; Ital. *preformazione*. The modern version of the old emboitement theory of development, according to which the germ contained all the parts of the adult organism preformed, but minute; so that the development of the individual consisted merely in an unfolding or 'evolution,' and growing, of parts already formed.

Modern preformism holds that, although the parts are not actually preformed as such in the germ, yet they are represented by material elements having a definite organization. Thus development would essentially consist in the sorting out and increase of these elements. According to this theory, then, there exists a germinal localization, such that every part of an adult organism is represented by certain particles, by some definite region, of the germ which gives rise to it.

The theory of preformation, in its early and crude form, was supported by Malpighi, Haller, and Bonnet, against the rival theory of 'epigenesis' put forth by Harvey in the 17th century. It did not survive the criticisms of Buffon, Maupertius, and Wolff. The theory, in its modern garb, is due chiefly to the work of Weismann and Roux. Cf. EPIGENESIS. The form preformism is also in use.

Literature: C. BONNET, Considérations sur les Corps organisés (1776); C. S. WOLFF, Theoria generationis (1774); E. HAECKEL, Hist. of Creation; C. O. WHITMAN, Evolution and Epigenesis, Woods Holl Biol. Lects. (1894); E. B. WILSON, The Cell in Devel. and Inheritance (1896). (E.S.G.)

Preformism: see PREFORMATION.

Prehension [Lat. *prehensus*, from *prehendere*, to seize]: Ger. *Prehension*; Fr. *préhension*; Ital. *presa*, (*il*) *prendere*. The act and the power of grasping.

Applied especially to the act of grasping with the thumb opposite the fingers, as do monkeys (anthropoids) and man. This power is considered to have been of considerable importance in the evolution of the primates. It is also called 'thumb-grasping.' (J.M.B.)

Premise (and **Premiss**) [two distinct words, recognized as such by older writers, but for the last century and more confounded. *Premise* is a legal word, derived from the Fr. *prémise*, which is a noun derived from the phrase *les choses promises*, used in inventories. *Premiss* is from the Fr. noun *prémisse*, and thence from the Low Lat. *praemissa*, which goes back, as a substantive, to the early part of the 13th century. But it was hardly looked upon as very good Latin at any time. *Propositio* replaced it, when elegance was preferred to technical accuracy]: Ger. *Vordersatz*, *Prämisse*; Fr. *prémisse*; Ital. *premissa*. A proposition, the consideration of which has logically affected, or contributed to the determination of, a conclusion of reasoning.

An enthymeme is usually defined as a

sylogism with a suppressed premise or premiss. Now, the expression of a train of thought may be elliptical, some thought being unexpressed in the confident anticipation that the reader, or hearer, will supply it. But in thought, a premise or premiss cannot be suppressed without ceasing to be either premise or premiss. If it be so suppressed, it enters into the leading principle of the inference. Every reasoning must proceed consciously upon some general principle, or it ceases to be a reasoning, and becomes a mere feeling of inability to think otherwise. On the other hand, when a principle of reasoning becomes by analysis distinctly apprehended and the precise effect which it has upon the conclusion understood, it becomes a *premise*, or, at least, a *premiss*. There is, therefore, no such thing as a suppressed *premiss*.

The word *premise* became usual in the logical sense, in English, as early as Chaucer. In Wilson's *Rule of Reason* (1551) it does not occur, the phraseology there being like the following: 'The double repeate, whiche is a woorde rehearsed in bothe Propositions, must not entre into the conclusion.' But in Blundevile's *Arte of Logicke* (1599) we read: 'A Syllogisme is a kinde of argument contayning three Propositions, whereof the two first, commonly called the premisses,' &c. In Watts's and other English logics it was spelt *premiss* and *premisses*. Johnson, however, in his *Dictionary*, gives *premises* in the plural and *premiss* in the singular, as distinct words, and remarks that the latter is little used in the plural outside of technical works. In such works the word spelt with two s's continued to be employed. (C.S.P.)

The two forms of spelling, for the logical term, are used interchangeably in this work. (J.M.B.)

Premonition [Lat. *praemonitorius*, giving previous warning]: Ger. *Ankündigung*, *Vorläufer*; Fr. *prémonition*, *avertissement*, *pressentiment*; Ital. *premonizione*, *segnì premonitori*, *presentimento*. A tendency to anticipate a coming occurrence apart from any causes or reasons which the subject himself can assign. The term *presentiment* is also in use. (G.F.S.—J.M.B.)

Some individuals form the habit of noting and watching such experiences, which habit renders them more apt to occur. Premonitions belong to the general fluctuations of mood and flow of thought, for which no detailed explanation is needed, except as their frequency or objective fulfilment demands

explanation. Premonitory signs have been discussed in connection with the problem of TELEPATHY (q. v.) and the 'phantasms of the living.' See VERIDICAL HALLUCINATIONS. Significant symptoms occurring before an attack in certain mental diseases (epilepsy, hysteria) are termed AURA (q. v.). (J.J.)

The term is also used for a general mood of foreboding (Ger. *Ahnung*), often without specific reference. (J.M.B.)

Preordination [Lat. *prae + ordinare*, to ordain]: Ger. *Vorbestimmung*; Fr. *pré-détermination*, *préordination*; Ital. *preordinazione*. See FOREORDINATION.

Preparation [Lat. *praeparatio*]: Ger. *Vorübung*; Fr. *préparation*; Ital. *preparazione*. The PRACTICE (q. v.) of a function in its immature and incomplete stages, by which its development and efficiency are furthered. Cf. HABITUATION, and EXERCISE.

Its principal use is in the German *Vorübung*. The concept has been developed by Groos in connection with PLAY (q. v.), which is considered preparation for the serious activities of adult life. See TERMINOLOGY, German, 'Uebung.' (J.M.B.)

Preperception [Lat. *prae + perceptio*, a taking]: Ger. *Präperception*; Fr. *préperception*; Ital. *prepercezione* (the equivalents are suggested). The ideal representation of an object preceding and facilitating the perception of it.

A term first used by G. H. Lewes (*Problems of Life and Mind*, 3rd series, Prob. 2, chap. x) and adopted by W. James, among others (see James, *Princ. of Psychol.*, i. 438-45). James appears to regard all mental pre-adjustment for perceiving an object as involving an anticipatory mental image; but this doctrine seems untenable. A batsman attending to the course of the ball as it comes from the hand of the bowler does not usually construct an anticipatory picture of the course it is going to take. If he does, his wicket is in great danger. (G.F.S., J.M.B.)

Prepossession: see PRECONCEPTION (1).

Prepotency [Lat. *prae + potens*, powerful]: Ger. *Präpotenz*; Fr. *suprémie*, *prépondérance*; Ital. *preponderanza*. (1) In zoology: when one parent transmits its hereditary characters in a stronger degree than the other parent, it is said to be prepotent or to have prepotency. Diminished potency in this respect, on the other hand, is called subpotency.

(2) In botany: when the pollen of two or more varieties is applied to the same stigma, that of one variety affects fertilization and is said to be prepotent.

Darwin carefully discussed the phenomena of prepotency in his *Animals and Plants under Domestication*. Romanes has considered them in relation to his hypothesis of PHYSIOLOGICAL SELECTION (q. v.).

Literature: C. DARWIN, *Animals and Plants under Domestication*, ii; G. J. ROMANES, *Darwin and after Darwin*, iii; GALTON, *Nature*, Jan. 27, 1898. (C.L.L.M.)

Presbyopia [Gr. πρέσβυς, old, + ὤψ, eye]: Ger. *Presbyopie*; Fr. *presbytie*, *presbyopie*; Ital. *presbiopia*. A condition in which, owing to a growing inelasticity of the lens fibres, and to a decrease in the power of contracting the ciliary muscle, the near point of vision is removed to an inconvenient distance, with a corresponding diminution in the size of the retinal image, and a consequent difficulty in reading and in other occupations which require close vision.

The lens becomes progressively more rigid, and the powers of accommodation progressively decline from infancy onward. In the normal emmetropic eye, the disturbing condition of presbyopia is not reached before the age of 45 to 50 years; and for practical purposes may be said to appear when the near point has reached 22 cm. or 9 inches. The advent of presbyopia will be earlier in hypermetropic (hyperopic) eyes, and later in myopic eyes, while in extreme cases of myopia it simply counteracts that condition. Presbyopia is corrected by the use of lenses, which restore the ordinarily used focussing points for near vision. Cf. VISION (defects of). See Landolt, *Refraction and Accommodation of the Eye* (Eng. trans. by Culver, 1886), 572. (J.J.)

Prescience: see FOREKNOWLEDGE.

Prescription (in law) [Lat. *praescriptio*]: Ger. *Ersitzung* (for usucaption by possession), *Verjährungsrecht* (for the law of negative prescription); Fr. *prescription*; Ital. *prescrizione*. A mode of acquiring a thing or right by long-continued and peaceable possession or use, without lawful interruption.

The law may affirmatively create a title, under such circumstances, in the possessor or user, which is *positive* or *acquisitive prescription*; or it may simply cut off any right of recovery by the original owner, which is *negative* or *extinctive prescription*.

'Possession may ripen into ownership; and this result may be produced either positively by the law declaring that the possessor is fully entitled after a certain time, or negatively by depriving adverse claimants of their

remedies, if during a certain time they omit to exercise them' (Pollock, *Jurisprudence*, chap. vii. 178). In early Roman law *usucapio* was the term used to describe such a mode of getting title, by positive declaration of law, to mancipable property; *praescriptio* was the term for the negative defence of the statute of limitations, and for acquisition by possession or use of non-mancipable property. Justinian abolished the distinction. In English and American law a claim to a right by prescription rests on the legal fiction that it is to be presumed there was a grant which has been lost.

Literature: MARKBY, *Elements of Law*, chap. xiii; SOHM, *Inst. of Roman Law*, § 51, 2. As to prescription in international law see VATTEL, *Droit des Gens*, Liv. II. chap. xi. (S.E.B.)

Present (the specious) [Lat. *presens*]: for equivalents see TERMINOLOGY, English, 'Moment.' The *minimum sensible* of time; a period of present time so short that the subject cannot distinguish relations of priority and subsequence between its parts.

The term 'specious' is used to distinguish the 'duration block,' which constitutes even the shortest concrete present as actually experienced from the conception of a present moment as a boundary line between preceding and succeeding time. The term is due to E. G. Clay, and it has been given currency by James. To quote James: 'The practically cognized present is no knife-edge, but a saddle-back, with a certain breadth of its own on which we sit perched, and from which we look in two directions into time. The unit of composition of our perception of time is a *duration*, with a bow and a stern, as it were—a rearward and a forward looking end.' The saddle-back metaphor and much else in James on the subject applies to any period of time, however prolonged, which subjective interest regards as present. For instance, I may say that I am at present writing a certain book: the present thus referred to may embrace years; but it is a saddle-back of time from which I regard the past and future. But on the whole it seems clear that James means by 'specious present' the irreducible minimum of duration necessary to constitute my concrete present. Cf. PRESENT TIME, TIME, TIME PERCEPTION, and SPACE.

Literature: E. G. CLAY, *The Alternative*, 167; W. JAMES, *Princ. of Psychol.*, 609 ff.; L. W. STERN, *Psychische Präsenzzeit*, in *Zeitsch. f. Psychol.*, xiii. 330 ff.; STRONG, *Psychol.*

Rev., iii. 156; ROYCE, *The World and the Individual*. (G.F.S.—J.M.B.)

Present Time: Ger. *Präsens, Präsenszeit*; Fr. *présent, temps présent*; Ital. *presente, tempo presente*. The present is a portion of time marked off from other portions as including our actual conscious life.

The length of what we regard as the present time varies according to the interest involved. A period of any length may be regarded as present, if we have no motive for dividing it into prior and subsequent portions.

The present is distinguished from other portions of time not merely by formal relations of antecedence and subsequence, but by the signature or coefficient of psychical actuality (whatever this may be) that belongs to it. In particular, it is stamped as the moment of actual sensation. Ward lays great stress on this point: 'To a being whose presentations never passed through the transitions which ours undergo—first divested of the strength and vividness of impressions, again reinvested with them and brought back from the faint world of ideas—the sharp contrasts of "now" and "then," and all the manifold emotions they occasion, would be quite unknown' (*Encyc. Brit.*, art. Psychology, 64). Cf. PRESENT (the specious). For the philosophical questions which arise, see TIME. (G.F.S.—J.M.B.)

Presentation [Lat. *prae + esse*, to be]: Ger. *Vorstellung, Darstellung* (see TERMINOLOGY, German, 'Vorstellung'); Fr. *présentation*; Ital. *presentazione*. (1) An object in the special form under which it is cognized at any given moment of perceptual or ideational process. 'Any object of knowledge or thought' (Baldwin, *Elements of Psychol.*, Glossary).

(2) An object as it is cognized at any given moment of perceptual as distinguished from ideational process.

(3) Another word for object.

The first meaning is that which is recommended. When the mind is engaged upon an object, the object appears or presents itself under varying aspects in different phases and stages of the process. Each of these appearances is a presentation of one and the same object. I see a piece of sugar; I take it in my hand and I put it in my mouth. Throughout I am mentally occupied with a thing recognizable as objectively the same. But the sugar as seen, as lifted in the hand, as rolled on the tongue, is successively presented in varying ways. Similarly, if I am attempting to solve a geometrical problem, the problem and its conditions constitute my

object throughout the whole train of thought. But in the various steps I take in order to find a solution, this object assumes different aspects. The one object comes before consciousness in a succession of presentations. I have a different presentation of it when the problem is solved from that which I had when I began upon it.

The limitation of the term presentation to perceptual consciousness has much to recommend it. It yields a neat expression for the distinction between perception and idea—perception being called presentation, and idea representation. But there are other sufficiently convenient ways of marking this distinction, and on the whole there seems to be a more pressing need for the word in the more comprehensive application which we propose for it. Ward consistently uses it in this wide sense, and he did much to make it a familiar term in English psychology. The third meaning ought not to be retained, because it is unwise to use the two words object and presentation in precisely the same way. (G.F.S., J.M.B.)

Presentationism: Ger. *Präsentationismus*; Fr. *présentationisme*; Ital. *presentazionismo* (suggested—E.M.). (1) Used by Hamilton for presentative, as opposed to representative, theories of knowledge. Cf. NATURAL REALISM. (J.M.B.)

(2) Used by recent writers as equivalent to phenomenalism: the theory that the only knowable reality is found in what is presented as conscious content to the knower. (J.D.)

(3) 'A doctrine the gist of which is that all the elements of psychical life are primarily and ultimately cognitive elements' (Ward, *Mind*, N.S., ii. 1893, 58).

The third sense is due to Ward, and we have given his definition. He quotes Hume as the first who explicitly formulated the doctrine: 'The mind is a kind of theatre where several perceptions successively make their appearance; pass, repass, glide away, and mingle in an infinite variety of postures and situations. There is properly no *simplicity* in it at one time nor identity in difference' (Hume, Green and Grose's ed., *Treatise*, i. 534). Ward attributes the doctrine to the 'school of Wundt' generally, though not to their master. He appears to refer especially to Münsterberg, who, however, can hardly be said to belong to such a 'school.' And yet, oddly enough, Münsterberg agrees with Ward that psychical activity is unrepresented and unrepresentable; only he

draws a different conclusion. He infers that as it is not presented, it cannot be described; and that since it is the business of psychology to describe, the psychologist cannot deal with it except by translating it into terms of something else which is describable, and therefore a matter of presentation. Ward, on the other hand, maintains that though it is not directly presented, yet we have an indirect cognition of it, obtained in a way which he has never fully explained; and that this cognition is sufficient to enable us to trace its function in psychical life. Münsterberg apparently holds that we have an indirect cognizance of it; but he regards this as unavailable in psychology, though it is of fundamental importance for philosophy.

In order to avoid presentationism (in sense 3), it is not necessary to adopt Ward's view that feeling and activity cannot be presented. It is only necessary to affirm that their psychical nature is not exhausted in the fact of their presentation. When they are presented they are presented as being something more and other than mere presentations. But this is true of all objects. A tobacco-pipe is presented; but this is not taken to constitute its whole being. The question remains, what is it presented as being? Besides being a presentation, it is also a tobacco-pipe. Similarly with feeling and activity; only their nature is psychical, whereas that of the tobacco-pipe is material. (G.F.S.)

Meanings (1) and (2) are both epistemological, and illustrate the way a term may mediate two opposing views: (1) is in the interest of realism, (2) in that of some form of subjective idealism. If meaning (3) be adhered to, neutrality may be secured in respect to epistemology. (J.M.B.)

Presentiment: see PREMONITION.

Pre-Socratic Philosophy: Ger. *vor-sokratische Philosophie*; Fr. *philosophie pré-socratique*; Ital. *filosofia presocratica*. Philosophy in Greece prior to Socrates.

This may be properly considered under one topic, because it was mainly devoted to one problem, the study of nature. The Sophists form a transition to the Socratic philosophy. The earlier thinkers of the period (see under SCHOOLS OF GREECE for the names of the individual philosophers) are frequently called the Ionics; but as practically all Greek philosophy until the time of Aristotle was the work of Ionians (either in Asia or in Italy or at Athens), the term is liable to mislead. Two sub-periods may be distinguished in the period before the Sophists. The earlier

thinkers stand in closer relation to previous religious or mythical views, and seek to substitute an intelligible hypothesis, based on real things or events, for the myths of the poets. In doing this they usually fix upon some one conception of seemingly fundamental importance and maintain it in a one-sided manner. The later thinkers of the period are freer from the mythical conceptions, and aim to adjust or construe the valuable elements in the earlier views. A distinction in the religious views which were influential at successive periods may also be noted. The earlier thinkers were most in touch with the Olympian religion, which concerned chiefly the deities of sky, earth, and ocean. The worship of chthonic deities, Dionysus, Demeter, &c., among the Orphic sect and in the Eleusinian mysteries, on the other hand, emphasized the immortality of the soul and its need of purification, thus directing the thought within, and introducing a dualism which had important ethical and metaphysical consequences. This religion influenced especially the Pythagoreans and Plato.

The myths which described the generation of the gods and the origination of worlds implied at least a view of a single, connected process, and of an inclusion of all in the universe within that process. The detached phenomena of sea or sky, or of successive days and seasons, were given unity and relation in such beings as Uranus (heaven) and Gaia (earth), or Dionysus. The work of the first philosophers was to substitute for these personifications actual concrete substances. They found ready to hand the conception that the world is one. They asked, 'From what did it come? What is the primal substance?'—calling their writings *περί φύσεως* (concerning the origin, or primal substance, or essential nature of things). These three connotations were probably all more or less involved in the term, though not as strictly distinguished until later.

The first answers selected, at least, actual substances, when Thales said 'water,' and Anaximenes 'air'; Anaximander's 'boundless' or 'infinite' suggests the chaos of the myths. All three of these Milesians regarded the world naively as animate, and its processes of change as spontaneous movements, hence they were called Hylozoists (regarding matter as animate).

Another religious and social conception found conspicuous recognition in the thought of the Ephesian Heraclitus (about 470 B.C.).

Like the Milesians, he names a primal substance, fire, of which all things are transformations; but to say that fire is the ultimate 'nature' of things and of the world is to emphasize a process, a flux, with a 'way downward' in which the change is from fire into things, and a 'way upward' in which things are becoming fire. The most fruitful conception in this thought was, as intimated, the principle of rational law (*λόγος*) or justice (*δίκη*), which controls this process and regulates the allotted (*εἰμαρμένη*) changes. The decree of Zeus, the destiny (*μοῖρα*) of the gods, the social and religious law of justice, have become the central conception for viewing a physical process, with implications which cling to the terms even in modern science. This law of changes gave a union of the 'one' and the 'many'—an antithesis which continually challenged the attention of the Greeks.

The characteristic of the Eleatics was a one-sided emphasis upon the first factor of this antithesis, the 'One.' Xenophanes, the religious satirist, criticized anthropomorphic conceptions of gods as born like mortals, and said that the One was God. Parmenides made this conception of oneness and permanence of determining and exclusive importance. What *is* must always have been and must always be: change is impossible, for this would imply that something could arise out of nothing, or pass into nothing, and both suppositions are absurd. This was not an abstractly logical principle, nor did it refer in the mind of Parmenides to the conservation of energy. 'What is' meant 'what occupies space.' The principle would then mean nearly the indestructibility of matter, except that matter had not yet been so abstractly conceived.

The earlier teaching of the Pythagoreans was religious and ethical rather than speculative. Like the Orphic religious societies, they emphasized the immortality of the soul (see *PSYCHE*) and the necessity of purifying it, thus preparing the way for a later, more complete separation between soul and body, and between the true being of the 'other world' and the present world of change. See *SOCRATIC PHILOSOPHY, NEO-PYTHAGOREANISM, and NEO-PLATONISM*. The astronomical and musical studies of the school reinforced the general demand for 'measure' or 'limit,' so fundamental in all Greek thought, and a later member of the school, Philolaus, regarded measure and number as the most important

aspect of things. Taking the speculative position that wholes are made up of simple parts, and regarding the units reached by numerical analysis as the proper units, he held that things are made of numbers (i. e. not of abstract numbers, but of simple units, as a line is made up of points). The fact that mathematical analysis, as in the successive bisection of a line, never gives an absolute unit, made possible the celebrated criticisms of Zeno, the Eleatic, upon pluralistic theories. These at once seek to explain the real as made up of simple units, and yet are unable to provide the units. If a line is made up of points, we ought to be able to say 'how many.' But the fact that we can never reach an end of our bisecting proves that we cannot assign any number. Similar criticisms were applied to pluralistic views of time as made up of instants, of which 'Achilles and the Tortoise' is the most famous.

The one *versus* the many—permanence *versus* change—formed the problem of the thinkers mentioned thus far, and usually with a one-sided insistence on one term of the antithesis. Empedocles of Sicily (about 490–430 B.C.), Anaxagoras of Klazomene (about 500–428 B.C.), and the Atomists combined these two terms in their mediating theories. All maintain the permanence of certain elements, and attribute the apparent arising and disappearing of things to rearrangements of these elements. Empedocles named four 'roots' of things—earth, air, fire, and water (selected, perhaps, partly on mythological grounds). Anaxagoras hit upon the standard of modern chemistry, and treated as elements substances which resisted analysis into heterogeneous materials. Later writers termed them *ὁμοιομερῆ* (homogeneous particles). The Atomists conceived their permanent elements more abstractly as *ATOMS* (q. v.), which they regarded as differing only in shape and arrangement—quantitative as contrasted with qualitative difference. The atoms were therefore each like the One of Parmenides, in that they were conceived as filling space, but, in addition to the atoms, the school postulated also the 'existence' of the void, of 'what is not.' To explain the rearrangements of elements, which cause changes in things, Empedocles and Anaxagoras introduced auxiliary elements which did the work of forces, although not considered as purely abstract forces. These were, for Empedocles, love and strife. The survival of the combinations produced was decided in his view

by natural selection, while his conception of the cosmical process is quite similar to modern evolutionary theories in general outline. The combining and disposing element for Anaxagoras was the *Nous* (q.v.), which ordered things intelligently, although it was not conceived as mind (distinct from matter) in a modern sense. Leucippus did not introduce another element, but supposed the atoms to be always in motion, and the various worlds to be the complex structures formed by atoms impinging upon each other. A mechanical theory of natural processes thus reached a clear formulation, and was developed in the hands of Democritus (who properly belongs to a later period) to a comprehensive system of MATERIALISM (q.v.).

For views of the soul in these earlier thinkers see *PSYCHE*. The problem of knowledge was not made the direct object of inquiry, and yet the discrepancy between theoretical conceptions and common opinion forced several thinkers to note the distinction between reflection and sense perception. The usual solution was to charge the senses with deception. Heraclitus based the charge on the fact that the senses find permanence in objects; Parmenides, on the ground that they report change.

The Sophists represent a shifting of the centre of interest and study from the cosmos to man, and an emergence of science from closed schools or societies into public discussion. The growing democracy made knowledge valuable to the citizen as well as to the scholar. Teachers of every subject, and especially teachers of rhetoric, found eager hearers. The study of the art of persuasion, especially upon political themes, led naturally to the study of politics itself. This was favoured also by the decay of older religious beliefs, and the series of political upheavals in which laws and justice seemed to become the sport of despots. The same problem as to the *phûsis* (the primal nature or essence) is raised again. But this time it is the 'nature' of justice and institutions, not of the cosmos. And as in the former period, so now, it is a process of transition from the older religious ideas and controls. The older Sophists—Hippias, Protagoras, Gorgias—are not represented by Plato as holding radical views on these questions. Younger Sophists are, however, depicted as maintaining that 'might is right,' or that laws are merely the invention of the 'many weak' against the 'natural law.' Individualism is thus the prevailing note,

and this found expression in the saying attributed to Protagoras, 'Man is the measure of all things,' which is the classic formulation for the doctrine of RELATIVISM (q.v.). It is not known that Protagoras himself applied his principle to ethics. He developed it rather with reference to sense perception. He affirms that all knowledge is perception, and that all perception is based on a two-fold motion—motion from the thing, and motion from the percipient organ—which forms a peculiar product that is neither the thing itself nor the organ itself, but a joint product different from either of its sources. He infers that what we perceive is an appearance and not the thing. See PHENOMENALISM, and SUBJECTIVISM.

Whether Democritus of Abdera, the city of Protagoras, was directly stimulated to his theory of knowledge by Protagoras (see Brochard, in *Arch. f. Gesch. d. Philos.*, ii. 368; Windelband, *Hist. Philos.*), he at least made a distinction between 'true' knowledge and that which is not genuine, and a corresponding distinction between the subjective character (*νόμος*) of perception, on the one hand, and the real existence of atoms and the void (*ἔρη*) on the other. Perception yields phenomena; rational thought (*λόγος*) gives things as they are in truth. This same principle determines the ethical principle of Democritus. No *phûsis* or permanent reality can be found in bodily pleasures. True happiness is found rather in repose and quiet that wait on knowledge.

Pressure Sensation [Lat. *pressura*, a burden]: Ger. *Druckempfindung*; Fr. *sensation de pression*; Ital. *sensazione di pressione* (or *barica*). A sensation obtainable (1) from the 'pressure spots' of skin and mucous membrane, (2) from striped muscle, and possibly (3) from joints. Cf. ARTICULAR SENSATION.

Pressure and pain are perhaps the oldest sense-processes in kind. On its intensive side, cutaneous pressure follows Weber's law. Both the cutaneous pressure and the articular sensation are endowed with the attribute of extent, and possess local signature.

The following points may be noticed:—(1) Pressure stimuli give rise, under favourable conditions, to two sensations, the primary and the secondary pressure. The explanation has been sought in a double conduction by the spinal cord, and in the existence of centrifugal fibres of the sensory nerves. (2) There is a close interrelation of the senses of pressure and temperature: cold and hot bodies are heavier than bodies of equal weight at a neutral temperature. (3) Under certain conditions—constancy of articular and inconstancy of cutaneous stimulation—there is an outward reference of sensation, e.g. to the tip of the stick held in the hand. Cf. HAPTICS.

Literature: FUNKE, in Hermann's Handb. d. Psychol., III. ii. 316; WEBER, Tastsinn u. Gemeingefühl (1834); SANFORD, Course in Exper. Psychol., expts. 1-12, 21-30; HENRI, Raumwahrnehmung d. Tastsinnes (1898); v. FREY, Untersuchungen ü. d. Sinnesfunktion d. menschlichen Haut, and in Ber. d. k. sächs. Gesell. d. Wiss., xxiii. 3 (1896); DESSOIR, Du Bois-Raymond's Arch. (1892). (E.B.T.)

Pressure Spot: Ger. *Druckpunkt*; Fr. *point de pression*; Ital. *punto di pressione* (*punti barici*). A spot of the skin evincing peculiar sensitiveness to stimulations of passively supported weight. See PRESSURE SENSATION, and WEIGHT SENSATION. Cf. the remarks made under TEMPERATURE SPOT on the use of the word 'spot' (in preference to 'point').

Literature: M. BLIX, Zeitsch. f. Biol., xx (1884); A. GOLDSCHIEDER, Du Bois-Raymond's Arch. (1885), 340; v. FREY, as cited under PRESSURE SENSATION (q.v.). (E.B.T.)

Presumption [Lat. *praesumptio*, used by

Quintilian to translate Gr. *πρόληψις*, anticipation, from *prae* + *sumere*, to take]: Ger. *Vermuthung*, *präsumiren* (vb.), *Voraussetzung* (in logic); Fr. *présomption*; Ital. *presunzione*. (1) In logic: a more or less reasonable hypothesis, supported, it may be, by circumstances amounting all but to proof, or, it may be, all but baseless.

Logical or philosophical presumption is non-deductive probable inference which involves a hypothesis. It might very advantageously replace hypothesis in the sense of something supposed to be true because of certain facts which it would account for. See PROBABLE INFERENCE (3). (C.S.P.)

(2) In psychology: the disposition towards acceptance or BELIEF (q.v.), which anticipates the complete resolution of doubt.

Theories of belief have not taken sufficient account of the transition states of mind between belief and disbelief, or between belief and REALITY FEELING (q.v.). The psychology of more or less doubt is reflected in the logical discussions of presumption and hypothesis. (J.M.B.)

Presumption (in law) [Lat. *praesumptio iuris*]: Ger. *Vermuthung*; Fr. *présomption*; Ital. *presunzione*. That which may be assumed without proof or taken for granted, e.g. a man charged with crime is presumed to be innocent until he has been proved to be guilty.

Presumptions are either of law or of fact. A *presumption of fact* is an inference drawn by a trier of a question of fact of the existence of one fact from the existence of others, and may be overthrown by proof to the contrary. A *presumption of law* is one which the law draws as the result of human reason and experience. It is a *rebuttable presumption* when it can be overthrown by evidence to the contrary, a *conclusive presumption* (*praesumptio iuris et de iure*) when it cannot be. 'In its origin, every presumption is one of fact and not of law. It may, in course of time, become a presumption of law, and even an indisputable one. Its truth may be so universally accepted as to elevate it to the position of a maxim of jurisprudence. Its convenience, as a rule of decision, may be so generally recognized as to place it in the rank of legal fictions. But so long as it retains its original character as a presumption of fact, it has simply the force of an argument' (Ward v. Metropolitan Life Insurance Co., 66 Conn. Law Reports, 227; 1 Greenleaf on Evidence, § 44; Stephen, *Digest of the Law of Evidence*, 246). A legal presumption is not strictly evidence (Lisbon v. Lyman, 49

New Hampshire Law Reports, 553). The main office of a presumption, in the trial of a cause, is to fix the duty of going forward with argument or evidence on a given question. See article on the Presumption of Innocence in Criminal Cases, by Jas. B. Thayer, in the *Yale Law Journal*, vi. 185; and chap. viii, on Presumptions, of his *Preliminary Treatise on Evidence at the Common Law* (Boston, 1898).

In a looser sense legal presumptions are termed matter of evidence (*United States v. Coffin*, 156 *United States Law Reports*, 432). But they are really substitutes for evidence, and in themselves have properly no probative quality, being merely the assertion of legal rules or conclusions.

The Roman law made large use of presumptions in the trial of causes (see *Dig.*, xxii. 3, *de Probationibus et Praesumptionibus*).

Literature: French Code civil, Liv. iii. tit. 3, § 3; and the German Civilprozessordnung, § 259; art. on Presumptions of Law and Presumptive Evidence, *Law Mag.*, vi. 348; *MENOCHIUS*, *De Praesumptionibus*, &c.; *BEST*, *Presumptions*. (S.E.B.)

Presumptive Inference: see PROBABLE INFERENCE (3).

Presupposition [Lat. *prae* + *suppositus*, placed under]: Ger. *Voraussetzung*; Fr. *présupposition* (a coined word); Ital. *presupposto*. Presupposition is either a conjecture or what is better called in English a POSTULATE (q. v.).

As a philosophical term it translates the German *Voraussetzung*, and is presumably preferred to 'postulate' by Germans and others imperfectly acquainted with the English language, because they suppose that postulate in English has the same meaning as Postulat in German, which is not true; for the English retains the old meaning, while the German has generally adopted the conception of Wolff. If postulate does not exactly translate German *Voraussetzung*, it comes, at any rate, quite as near to doing so as presupposition; a good translation would be 'assumption.' (C.S.P.)

Pretence: see SEMBLANCE, LIE, EQUIVOCATION, and MAKE-BELIEVE (1).

Preterition [Lat. *praeteritio*, a passing over]: Ger. *Übergehung*; Fr. *préterition*; Ital. *preterizione*. In Calvinistic theology, the doctrine that in foreordination God, having in the exercise of his sovereign pleasure elected some to eternal life, passed over the rest and ordained them to eternal death for their sins.

The theory of limited atonement was first clearly enunciated by Augustine, who taught

that while God decrees the salvation of the elect without reference to anything in themselves, he decrees the perdition of the non-elect on account of their sins; the decree of preterition differs from that of election to life in that the sinfulness of the lost is a condition of the decree of their condemnation.

Literature: see FOREORDINATION. (A.T.O.)

Preternatural [Lat. *praeter*, beyond, + *natura*, nature]: Ger. *aussernatürlich*; Fr. *contre nature*, *surnaturel*; Ital. *preternaturale*. Transcending ordinary natural agencies, whether regarded as supernatural or not.

(A.T.O.)

Prevarication: Ger. *Verdrehung*; Fr. *prévarication*; Ital. *prevaricazione*. Cf. EQUIVOCATION, LIE, and VERACITY. A general term for verbal deception, often of a quasi-logical sort.

(J.M.B.)

Prévost, Pierre. (1751-1839.) Born and educated under Le Sage, a disciple of Newton, at Geneva, he travelled in Holland and England, and lived in Paris. Succeeded Sulzer in the Berlin Academy; professor of literature at Geneva, 1784; professor of philosophy there, 1793. He may be regarded as an adherent of the Scottish philosophy.

Preyer, William Terrey Thierry William. (1841-98.) Born at Manchester, he was educated there and at London, Duisburg, Bonn, Berlin, Heidelberg, Vienna, and Paris. Privatdocent at Bonn, 1865; professor of physiology at Jena, 1869; Privatdocent at Berlin, 1888. Afterwards he lived privately at Wiesbaden, where he died.

Price [OF. *preis*, Lat. *pretium*]: Ger. *Preis*; Fr. *prix*; Ital. *prezzo*. (1) The quantity of one article which is exchanged for another.

(2) The quantity of money for which an article can be exchanged.

Under a system of BARTER (q. v.), either of the articles exchanged may be regarded as the price of the other. Under the modern commercial system one of the parties to the exchange almost always gives money or a right to receive money; and the term price is practically confined to sums of money thus transferred.

Smith, followed by a number of writers in the early part of the nineteenth century, said that the *real price* of anything was the toil and trouble of acquiring it; but it is now customary to use the word *Cost* (q. v.) rather than price to convey this idea.

For the distinction between MARKET PRICE and NORMAL PRICE see those topics; cf. also SUPPLY AND DEMAND. (A.T.H.)

Price, Richard. (1723-91.) Born at Tyn-ton, Wales, he was educated at Talgarth and in London. He became a Presbyterian minister; was chaplain at Stoke Newington, 1743-56, and pastor of churches in Hackney and Newington Green until his death. He wrote in theology, ethics, economics, and politics.

Pride [AS. *pryd*]: Ger. *Stolz*, *Eitelkeit* (vanity); Fr. *fierté*, *orgueil*, *vanité* (vanity); Ital. *orgoglio*, *vanità* (vanity). A sentiment having the self for its object, involving: (1) a certain fixed preconception concerning one's own qualities, actions, powers, social states, place in the estimation of others, &c. (2) Satisfaction, more or less keen, in contemplating oneself as conforming to this preconception. What-ever ministers to this satisfaction in a conspicuous way, we are said to be proud of. (3) Grief or resentment when anything occurs to disturb the preconception.

The preconception of the self which is implied in pride when exaggerated is called conceit. When it manifests itself in such a way as to provoke resentment or ridicule in others, it is termed presumption or arrogance, and, in smaller matters, egotism.

But conceit is not confined to pride; it is also found in the sentiment of vanity. What distinguishes vanity from pride is the tendency in vanity to show off. The conceit of the vain person requires for its sustenance explicit reference to the applause, admiration, or envy of others. It is wounded or disturbed when such overt recognition is withheld. The proud person who is conceited takes his own estimate of himself, including his preconception of the attitude of others towards him, as a matter of course. He may resent expressions of admiration or applause, just because they imply that his excellences are not taken for granted, but are regarded with surprise. Or he may think so highly of himself in comparison with others as to resent the suggestion that what they think or do can make any difference to him. If he accepts tributes of admiration, he accepts them merely as unchallenged right, and without elation. In vanity, on the contrary, there is a continual appeal to others for recognition, for without express recognition self-conceit is hesitating and insecure. The frog in the fable who tried to swell himself into an ox is a typical example of vanity; the hero of the *Bride of Lammermoor* is a typical example of pride.

It should be noted that pride, unlike vanity, does not involve belief in one's own superiority to others. The most deeply rooted pride may

be connected merely with the conception of independence or equality, and may be manifested mainly by a refusal to accept favours or to be under obligation. (G.F.S.—J.M.B.)

Spinoza defines pride as 'thinking too much of ourselves, through self-love.' 'As overestimation is an effect or property of love, so pride is an effect or property of self-love' (Def. 28 of the affections, *Ethics*, Pt. III. Prop. 59). Mandeville held that 'the moral virtues are the political offspring which flattery begot upon pride.' Even in man's 'more refined notions of virtue,' he insists, 'we may discover no small symptoms of pride; and the humblest man alive must confess that the reward of a virtuous action, which is the satisfaction that ensues upon it, consists in a certain pleasure he procures to himself by contemplation on his own worth; which pleasure, together with the occasion of it, are as certain signs of pride as looking pale and trembling at any imminent danger are the symptoms of fear' (*Enquiry into the Origin of Moral Virtue*).

Kant includes all inclinations and desires in the single term 'self-regard': 'This is either the self-love that consists in an excessive fondness for oneself (*philautia*), or satisfaction with oneself (*arrogantia*). The former is called particularly selfishness, the latter self-conceit. Pure practical reason checks selfishness [converting it into rational self-love]. . . . But self-conceit reason strikes down altogether, since all claims to self-esteem which precede agreement with the moral law are vain and unjustifiable': respect for the moral law means the humiliation of self-conceit (*Critique of Practical Reason*, 197; Eng. trans., Abbott, 165). Kant's view is an extreme statement of the Christian estimate of pride, which, as the opposite of the virtue of humility, was condemned by mediæval moralists as a deadly sin. 'Pride,' says Thomas Aquinas, 'is opposed to humility, and humility properly regards the subjection of man to God: hence, contrariwise, pride properly regards the want of this subjection, in that one lifts himself up above the limit prefixed for him according to the divine rule or measure. . . . The root of pride is taken to be in this, that a man somehow is not subject to God and to the rule of his guidance.' It follows that pride is a mortal sin; still, 'some movements of pride are only venial sins, while reason consents not to them. . . . Pride is of its kind the most grievous of sins, because it exceeds them all in that turning away from God, which is the formal and

crowning constituent of sin' (*Summa*, II. ii. qu. 162, arts. 5, 6; Eng. trans. by Rickaby, *Aquinas Ethicus*, ii. 365-7). (J.S.)

Literature: many of the textbooks of psychology, and the literature of EMOTION (q.v.). See also BIBLIOG. G, 2, c.

Priest [Gr. *πρεσβύτερος*, elder]: Ger. *Priester*; Fr. *prêtre*; Ital. *prete*. The authorized representative of a deity, who mediates between the deity and the worshipper, conveying the latter's offering and sacrifices to the deity and communicating the will of the deity to the worshipper.

The term priest is sometimes applied to any minister of religion. But, strictly speaking, the distinctive functions of the priestly office are mediation and sacrifice. The priest is to be distinguished from the prophet, who is an inspired revealer and organ of new truth. The priest belongs to a prescribed order, in accordance with which his ministry is exercised. In the Christian scheme, Jesus Christ is the great High Priest, who once for all offered himself as a mediatorial sacrifice for his people.

Literature: KÜPER, *Das Priesterthum des alten Bundes*; MANNING, *The Eternal Priesthood* (1883); PROBST, *Sacramenta u. Sacramentalien*. (A.T.O.)

Priestley, Joseph. (1733-1804.) Born near Leeds, he was educated at Daventry. Ordained 1755, in an Independent congregation at Needham Market, Suffolk; resigned 1758, because of a change in his views towards Unitarianism; taught in Warrington Academy, 1761-7, where he became acquainted with Richard Price and Franklin; received the degree of LL.D. from Edinburgh, and became fellow of the Royal Society, 1767; librarian and literary companion to the Earl of Shelburne, 1773-80; pastor of Unitarian congregations at Birmingham, 1780-91, and at Hackney, 1791-4. In 1794 he moved to the United States, settling at Northumberland, Pa. See MATERIALISM.

Primacy and Primitive: see PRIMARY.

Primary and Secondary Qualities: see QUALITY AND QUALE.

Primary (1), **Primitive** (2), **Primordial** (3) [Lat. *primus*, first, + *ordo*, rank]: Ger. (1) *erst*, *ursprünglich*, (2) *primitiv*, (3) *ursprünglich*; Fr. (1) *primaire*, (2) *primitif*, (3) *primordial*; Ital. (1) *primario*, (2) *primitivo*, (3) *primordiale* (the distinctions are not exact in any of the languages). These terms all relate to value or to elements, and characterize their original, underived character. The two meanings of early in time and

first in rank are generally more or less blended. The idea of first in rank, because first in time and so fundamental, is uppermost in primary; it is used to emphasize what is not secondary or subsidiary in importance—as primary truths. Primitive refers rather to time, and may be used as a depreciatory term, connoting the undeveloped and crude character of what comes first. Primordial has an elemental significance; it denotes the original factors or forces out of which later development has proceeded. Among the Neo-Platonists it referred especially to the germinal, vital power of the original constituents. Cf. ORIGINAL (1). (J.D.)

Kant applies the terms primate and primacy (Primat) to that which is logically or rationally (durch Vernunft verbunden) primary in relation to what is secondary or derived (*Krit. d. prakt. Vernunft*, 144, 146). (J.M.B.)

Primary Attention: see ATTENTION.

Primary Memory: see ORGANIC MEMORY.

Primary Position: Ger. *Primärstellung*; Fr. *position primaire*; Ital. *posizione primitiva*. (1) A position from which the lines of sight may move without torsion of the eyeballs.

It is the position which the eyes assume when the head and body are erect and the eyes directed forward upon a distant horizon. The lines of sight are parallel, and their plane depressed a little below the horizontal—probably in accordance with the level of insertion of the rectus ext. and rectus int. muscles. The position is not absolutely constant for different individuals, or even for the same person at different times; it is most easily determined by the after-image method.

Literature: WUNDT, *Physiol. Psychol.* (4th ed.), ii. 114, 116; HELMHOLTZ, *Physiol. Optik* (2nd ed.), 619, &c.; SANFORD, *Course in Exper. Psychol.*, expt. 131.

(2) The 'primary position for convergence' is that depressed position of the plane of regard in which convergence is possible without rotation of the eyes about the lines of regard.

Literature: SANFORD, *Course in Exper. Psychol.*, expt. 133; HELMHOLTZ, *Physiol. Optik* (2nd ed.), 626. (E.B.T.)

Primary Truth: see PRIMARY, FUNDAMENTAL TRUTH, and ULTIMATE.

Primates [Lat. *primus*, first]: Ger. *Primaten*; Fr. *primates*; Ital. *primati*. The first or highest order of mammals.

The primates include the lemurs, monkeys, apes, and man. They are characterized by five digits, of which one is opposable to the

others, making a prehensile hand or foot (the digits are generally provided with flat nails); the orbit is completely bony; the clavicles are well developed; the femur never has a third trochanter; the stomach is simple; the testes descend into the scrotum; there are two thoracic mammae. Cf. ANTHROPOID.

Literature: CLAUS, Zoologie; BREHM, Thierleben; HARTMANN, The Anthropoid Apes; HUXLEY, Man's Place in Nature; FLOWER and LYDEKER, Mammals Living and Extinct; HAECKEL, Generelle Morphologie. (C.S.M.)

Prime [Lat. *primus*, first]: Ger. *erst*, *ur-* (in compounds, as *Ursache*); Fr. *prime*, *premier*; Ital. *primo* (general). First: e. g. (1) First in order of causation, as 'prime motor.'

(2) First in order of development and complexity; elementary; as 'prime number.'

(3) In exact logic, a 'prime aggregant' is an aggregant not separable (without further information) into aggregants; so also 'prime component' (called also, but inappropriately, a 'prime factor'). (C.S.P.)

Prime (in acoustics): Ger. *Grundton*; Fr. *son fondamental*; Ital. *suono fondamentale*. See FUNDAMENTAL TONE.

Primitive: see PRIMARY.

Primitive Credulity: see BELIEF.

Primordial: see PRIMARY.

Primum cognitum [Lat.]. A topic of the most obsolete psychology. The question was what was the earliest form of intellectual conception in the development of a child, not of a clear and distinct kind, but yet not mere perception or imagination, nor yet the earliest concrete judgment, but, as they said, 'simple apprehension of things.'

Literature: AQUINAS, Summa Theol., pars I. qu. 85, art. 3; AEGIDIUS ROMANUS, in I. Phys., cap. ii. qu. 4; SCOTUS, Quodlibet, 2, and Opus Oxon., I. iii. 2; Conimbricenses, in I. Phys., cap. v. qu. 4; ZABARELLA, De Ord. Intell., passim. (C.S.P.)

Primum mobile [Lat.]. In the Aristotelian system, the physical system which is next to God, the unmoved mover. Cf. MOTION.

Motion is a sign of change and so of imperfection; but the first mover as next in rank to God has a movement which continually returns into itself, and thus affords a symbol of permanence. Its movement is circular and recurrent. Thus the diurnal revolution of the heavens was accounted for. The idea was taken up and developed in the Ptolemaic system, the primum mobile being the tenth and uttermost concentric sphere,

which in its daily revolution takes all the fixed stars with it. (J.D.)

Principal [Lat. *principalis*, from *princeps*, chief]: Ger. *Haupt-* (in compounds, as *Hauptergebniss*), *Principal-* (in compounds, as *Principalcoordination*, Avenarius); Fr. *principal*; Ital. *principale*. Chief. *Principal cause* is that which by its own virtue produces the effect. *Less principal cause* is one which aids the principal cause but is always unequal to producing the effect. The less principal cause is procataretic or instrumental.

Principal end: the end which an agent first and primarily intends. It must not be mistaken for the ultimate or remote end.

Principal form is the form which *per se* constitutes a species. It is always a substantial form.

Principal part: any part the removal of which involves the destruction of the whole organism of which it is a part. (C.S.P.)

Principal (in law): Ger. (1) *Vollmachtgeber*, (2) *Hauptschuldner*, (3) *Hauptverbrecher*; Fr. (1) *mandant*, (2) *débiteur principal*, (3) *auteur*; Ital. (1) *mandante*, (2) *debitore principale*, (3) *correo principale*. (1) One for whom another is agent. See AGENCY (in law).

(2) One for whom another is surety.

(3) He who is the chief wrongdoer in a criminal transaction, as distinguished from an accomplice or accessory. (S.E.B.)

Principle [Lat. *principium*, commencement, beginning: trans. of Gr. *ἀρχή*, beginning, authority]: Ger. *Princip*; Fr. *principe*; Ital. *principio*. As the etymology suggests, the term principle has (or had) a double sense: chronological and normative (for a similar connection see PRIMARY). Literally, it means the first in time. But this may be taken as expressing the fundamental absolute reality, from which everything else is derived, and with reference to which all else is secondary and subsidiary. The chronological sense has almost disappeared in modern use, so that principle has come to mean the logical, or metaphysical, basis or ground of other truths. (1) Logically, the principle is a proposition upon which conclusions depend for their validity, and which, if conceded, establishes their truth: opposed to consequence.

(2) Scientifically, it is the law through which a diversity of facts, otherwise unrelated and unexplained, are classified and interpreted: opposed to datum, brute fact, or 'mere' fact.

(3) Practically or morally, it is the law which controls the factors of conduct: opposed

to pleasure or interest as the immediate, or individual, spring of action.

(4) Metaphysically, it is that which determines orders of fact or truth; which possesses superior and primary reality. While in the three previous senses the term principle has a regulative or normative sense, metaphysically this meaning is combined with the older sense of constitutive objective reality. The metaphysical principle includes the three notions of element, cause, and regulating law.

Greek philosophy began with the search after the principle in the literal sense: that original reality (a) from which other things are derived, and (b) out of which they consist. In the sense (a) it was implicitly or explicitly dynamic, a force, a causal power; in the sense (b) it was static, an element of subsistence. The first meaning led up to Aristotle's form (*εἶδος*) as a principle; the second to his matter (*ὑλη*). Modern thought, with its clearer distinction of subject and object, has tended to differentiate the notions of element, cause, force, and law, with the results stated above. The term 'first principles' is used technically to express primary intuitions, truths to which assent must be given without any further reason or ground. (J.D.)

Principle (in phrases): see AGREEMENT, DIVISION (in logic), Individuation under INDIVIDUAL, SUFFICIENT REASON, Döpler's principle under HEARING (Sound), various logical principles, as e.g. ECONOMY, and Homogeneity under SCIENTIFIC METHOD.

Priority (with **Prior** and **Prius**) [Lat. *prior*, earlier; *prius*, first]: Ger. *Priorität*; Fr. *priorité*; Ital. *priorità*. These words are used in about a dozen different senses in philosophy, although only five are specially recognized. They are enumerated in the mnemonic verses,

Tempore, Natura, prius Ordine, dic et Honore,

Effecto Causam dicimus esse prius.

(1) *Priority in time* is considered by Kant to be dependent upon the peculiar constitution of the internal sense (though he does not attempt any inquiry into the constitution further than that it places objects in time). Now, so far as effects in the outer world are due to forces, it seems to be proved that they follow the law of energy. In that case, though connection and continuity in time are important, yet the flow of time one way rather than in the reverse way is unmeaning. There is no effect that follows after its cause. Cf., however, CAUSE AND EFFECT, and see TIME. The law of energy

amounts to this, that the instantaneous accelerations of the motions of particles depend solely upon the relative positions of those particles at that same instant; and what follows after depends upon what now is, in the same way precisely, and is calculated by the same laws, as what went before depends upon what now is. Thus, in respect to the direction of its flow, time seems to be, if not purely a psychological affair, at any rate not purely a dynamical affair. Those physical phenomena which proceed in one direction and not in the reverse direction, and which seem to be well explained, such as the viscosity, diffusion, and conduction of gases, may all be explained by principles of probability.

From the point of view of causality exercised by our ideas and upon our ideas, the relations of *prius* and *posterius* present a different problem. Our wishes and endeavours cannot change the past in the least degree; and the future cannot affect our senses. The past affects the senses, and more and more strongly the nearer it is; our will can affect the future, and more and more strongly the nearer it is. The consequence is that the whole procedure of investigating the past and the future is different from the problem as regards real time.

This kind of priority is divided by the schoolmen into priority *quoad existentiam* and *quoad generationem* (that is, the older of two is the prior).

(2) In a meaning allied to temporal priority, Aristotle sometimes speaks of sense as *prior* to reason.

(3) That which is at an earlier stage of development is also called prior to that which is more matured; boyhood is said by Aristotle to be prior to manhood.

(4) So matter is prior to form; and potency to energy.

(5) The simple is prior to the complex; as a point to a line, a line to a surface, a surface to a solid.

(6) The rudimentary is prior to the recondite in order of exposition.

(7) In order of arrangement, the thing reached sooner is prior to that reached later.

(8) The relatively independent is prior to the relatively dependent, as substance to accident, and parts to whole.

(9) That caused thing which is nearer the cause, in any of the four senses of cause, is prior to that which is further from the cause.

(10) That is 'prior in illation' from which

the posterior follows as a rational consequence.

(11) The more general is prior to the more special.

(12) That which is more honourable or higher in rank or dignity is prior to that which is less so.

Prius natura, as practically used by Aristotle, seems often to convey no clear notion. But he certainly calls the *prius dignitate* and *prius causalitate* both *prius natura*. The usage of the Aristotelians is to call that *prius natura* which is prior in consecution or in causality. That is prior in consecution which is such that if something else is supposed it is supposed, but which being supposed something else is not thereby supposed. Thus, if two are supposed, one is supposed; but one being supposed, two is not thereby supposed. Hence, one is prior to two. *Prius causalitate* is either *prius natura generantis* or *prius natura intendente*. *Prius natura generantis* is the priority of the simple to the complex, as of the parts to the whole; *prius natura intendente* is the priority of the perfect to the imperfect, as of the whole to the parts. But this hardly seems to agree with Aristotle (646 a 25). *Prius nobis* (πρὸς ἡμᾶς πρότερον) is what is prior in the order of learning, or more easily known. (C.S.P.)

Privacy: see PUBLIC AND PRIVATE.

Private [Lat. *privatus*, not public, from *privus*, single]: Ger. *privat* (the occasional use of *geheim* is significant of the early identification of *private* and family concerns); Fr. *privé, particulier*; Ital. *privato*. (1) Strictly pertaining to (a) a single individual (e.g. a private life), or (b) a group of individuals (e.g. a private company).

(2) A person who holds no public office or military commission is a private person, soldier, &c. Cf. PUBLIC AND PRIVATE.

(F.H.G.—J.M.B.)

The conception of (1) private affairs, and (2) a private person, is extremely dim in tribal communities, and becomes quite distinct only in high civilizations. PUBLIC (q.v.) and private are fully differentiated only when civic organization has arisen. Distinction (2) antedates the oldest written decisions of English common law. 'Any private person (and *a fortiori* a peace officer) that is present when any felony is committed is bound by the law to arrest the felon, on pain of fine and imprisonment, if he escapes through the negligence of the standers by' (Blackstone, *Commentaries*, Bk. IV. chap. xxi). (F.H.G.)

Private Law [Lat. *ius privatum*]: Ger. *Privatrecht*; Fr. *droit privé*; Ital. *diritto privato*. That part of law which looks mainly to individual interests and relations, as distinguished from public law, which looks merely to public interests and relations.

The line of demarcation cannot be precisely drawn. In the pursuit of remedies provided by private law, the state is never an actor, unless for the protection of rights of individuals, or of rights of its own not directly flowing from its sovereign character. Proceedings of the class last mentioned are sometimes classed under the remedies of public law (see Holland, *Jurisprudence*, chap. xvi. 330; Pollock, *Jurisprudence*, chap. iv. 94). Private law comprehends the law of private property and obligations, including succession, the domestic relations, and, in a certain sense, civil procedure.

'Publicum ius est quod ad statum rei Romanæ spectat: privatum quod ad singulorum utilitatem' (*Inst. of Just.*, i. 1, de *iustitia et iure*, 4). (S.E.B.)

Privation [Lat. *privatio*, trans. of Gr. στέρνησις]: Ger. *Beraubung*; Fr. *privation*; Ital. *privazione*. The negation or absence of what is natural or customary, i.e. of habit.

Thus, blindness is privation of sight. See Aristotle's *Praedicamenta*, chap. x; also *Met.*, I (the book περὶ μωρίας), iv. 1055 b 2, and Δ. xxii. (C.S.P.)

Aristotle especially attributes privation to matter (ὑλη) conceived as if lacking form (εἶδος) (*Met.*, 1055 b 13). To the scholastics evil is the privation of good. Cf. Eisler, *Wörterb. d. philos. Begriffe*, 'Beraubung', 'Privation.'

The adjective form privative (Gr. στερητικός) denotes, as in privative PROPOSITION (q.v.), the presence of privation. (J.M.B.)

Privative: see PRIVATION.

Privilege (in law) [Lat. *privilegium*]: Ger. *Vorrecht, Privilegium*; Fr. *privilège*; Ital. *privilegio*. (1) A beneficial faculty or immunity conferred by a state upon one or more persons.

(2) As used by civilians, an implied hypothecation of a person's property, given by law to secure his obligations. See the French *Code Civil*, Liv. III. Tit. 18.

Breach of privilege: a violation of the privileges belonging to a legislative body or its members. Question of privilege: a question raised in such a body, touching its privileges or those of any of its members.

In ancient Rome a *privilegium* was a law specially directed against an individual,

answering to our Act of Attainder. The Twelve Tables forbade such legislation. In post-Augustan Latin the term has its present signification. In free governments the principle of equality of rights or constitutional provisions often secure to all what in other times or countries would be known as special privileges of particular individuals, e.g. the privilege of the writ of habeas corpus. (S.E.B.)

Probabilism [Lat. *probabilis*, from *probare*, to prove]: Ger. *Probabilismus*; Fr. *probabilisme*; Ital. *probabilismo*. (1) The casuistical doctrine that any opinion held by a recognized doctor of the Church must be regarded as probably correct, and may therefore be safely followed by a layman, who cannot be expected to decide where doctors differ.

This doctrine is a logical outcome of CASUISTRY (q.v.). It was first stated by the Spanish monk Molina (1528–81), and was afterwards utilized more especially by Jesuit confessors. The bearings of this doctrine upon the moral life were incisively exposed by Pascal in his *Lettres écrites à un provincial* (1656).

(2) The term probabilism is also used to describe the theory which mediates between a sceptical view regarding knowledge, and the needs of practical life.

According to this theory there is no absolutely certain knowledge, but there may be grounds of belief sufficient for practical life. This view was held by the Sceptics of the Academy, especially by Carneades (214–129 B.C.), who distinguished different degrees of belief and of probability. See Windelband, *Hist. of Philos.*, II. i. 17. (W.R.S.)

It is logically related to PRAGMATISM (q.v.) and to the justification of what is known as WILL TO BELIEVE (q.v.). (J.M.B.)

Probability [Lat. *probabilis*, likely]: Ger. *Wahrscheinlichkeit*; Fr. *probabilité*; Ital. *probabilità*. (1) Likelihood. That state of a case or a question which results from superior evidence or preponderance of argument on one side, inclining the mind to receive that as the truth, but leaving some room for doubt.

(2) Quantitatively: that character of a proposition of doubtful truth which consists in the frequency with which like propositions are found true in the course of experience; the ratio of the number of favourable cases to the whole number of equally possible cases; the ratio of the number of occurrences of an event to the total number of occasions in the course of experience. This is also called the chance of the event. Thus a chance decidedly

greater than $\frac{1}{2}$ is likelihood; decidedly less, improbability or bare possibility; while a chance equal to unity is certainty, and a chance equal to zero is impossibility.

It is usual to distinguish between direct and inverse probability. Thus the direct probability that on the occasion *A* there shall be the event *B* is the value towards which tends the ratio of the number of occasions *A* upon which there is the event *B*, to the total number of occasions *A*, as these occasions recur without limit. (Of course, it may be that there is no definite value to which the ratio tends; to such cases the theory does not apply.)

Similarly, the inverse probability that the event *B* shall have happened upon the occasion *A* is the value towards which tends the number of happenings of *B* upon occasions *A*, to the total number of happenings of *B*, as these latter recur without limit.

A die is cast. Who shall say whether it is going to turn up ace or not? Of this our ignorance is profound. Yet all will grant that in a large number of throws, unless the die is loaded, ace should turn up about one-sixth of the time. This combination of ignorance and knowledge confronts us in all problems in chance: ignorance as to the special event, knowledge as to what may be expected in the long run.

Consider the following actual results of 200 spins of a coin, *H* meaning head and *T* tail.

HHTHT	THTTT	TTHTH	TNHTH
HTHTH	HHHTT	THHTH	TTTTH
HHHTH	HHHTH	HTHHH	TTTTH
THHHH	HTTHH	THTHH	HHHTH
TTTHH	THTTT	THTTT	TTTTH
HTTHH	HHHTT	THHTH	THHTH
HHHHH	TTTHT	TTTTT	TTTTH
THTTT	THHTT	HHHTH	HTTHH
HHTHH	TTTTT	HTTHH	HTHTH
HTTTT	HHHTT	THHTH	HTHTH

At first glance all is confusion: the ratio of the number of heads to the whole number of spins runs successively 1, 1, $\frac{2}{3}$, $\frac{2}{3}$, $\frac{2}{3}$, $\frac{2}{3}$, ... almost haphazard. But, continuing the spins, the ratio grows more and more steady, as indicated in Fig. 1. There is a tendency towards the value $\frac{1}{2}$, and the deviation from this value, after the first 70 spins, is constantly slighter. This is a first sign of order. Again, of the 97 times that head occurs, in 43—nearly half the number of times—it is followed by head, as it should be; while of the 103 times that tail appears, it is followed by tail 49 times. Of the 32 possible successions of results for five consecutive spins, nearly

PROBABILITY

every one occurs several times in the table. In fact, the characteristics of a chance distribution are shown as well as could be expected for so small a number of spins. Were we to keep on for thousands and millions of spins, these characteristics would come out more and more clearly, and we should arrive at a distribution approximating as nearly as we please (so far as *ratio* of occurrences are concerned) to an ideal chance distribution, in which the separate events and any designated successions and combinations of them would occur with frequencies proportional to the respective possibilities of each. The particular succession of 200 spins actually recorded above could be expected but once in $2^{200} (> 10^{60})$

But the mathematical theory is usually deemed to have its origin in the correspondence of Pascal and Fermat concerning the 'problem of points,' a problem suggested by a certain Chevalier de Méré: Two players leaving off in the midst of a game, it is proposed to divide the stakes proportionally to their chances of winning were the game continued. The mathematical theory of probability deals, of course, not with the determination of the probability of any simple or unanalysable event, but with the evaluation of the probability of complex events, when the probabilities of the simple events concerned in them are supposed to be given. In solving the 'problem of points,' Pascal made use of

trials. Could we make 100 trials per minute for 16 hours daily, 300 days in the year, 3×10^{62} years would not suffice for so many trials.

The phenomena in games of chance had long been noticed by observant gamblers. At last, some one comes to Galileo (1564-1642) and asks him why with three dice 10 is thrown oftener than 9, while yet the number of combinations giving each is the same, namely six. Galileo showed that, if account be taken of the number of ways in which each combination can be obtained, then, of $216 (=6^3)$ possibilities, 25 give 9, while 27 give 10.

the two fundamental principles of combination upon which the whole science has been built, namely:

I. *The probability that both of two independent events shall happen is the product of their respective probabilities.*

II. *The probability that one or the other of two mutually exclusive events shall happen is the sum of their respective probabilities.*

Thus ace followed by six (with a single die) has a probability $\frac{1}{6} \times \frac{1}{6} = \frac{1}{36}$; while ace and six, without regard to order, has a probability $\frac{1}{6} + \frac{1}{6} = \frac{1}{3}$. That 7 ($=6+1, 5+2, 4+3$) shall somehow be thrown has a probability $\frac{3}{18}$.

In the problem of points, let us suppose, as did Pascal, that the players *A* and *B* are of equal skill. Then if *A* lacks two points of winning and *B* three points, *A*'s chance of winning is precisely the same as that in coin-spinning of getting head twice before tail is got thrice, which again is the same as getting head at least twice in four spins. This is the sum of the probabilities of getting head just two times, just three times, and just four times in four spins. Plainly the number of ways in which head can be got just twice in four spins is simply the number of ways that two things can be taken out of four. A convenient notation for this, in effect suggested by Euler, is $\binom{4}{2}$. The probability of any particular sequence of four spins is $2^{-4} = \frac{1}{16}$. Hence, the probability of one or another of the ways that will give head twice or more is

$$\frac{\binom{4}{2} + \binom{4}{3} + \binom{4}{4}}{16}$$

This is *A*'s chance of winning; similarly, *B*'s is

$$\frac{\binom{4}{0} + \binom{4}{1}}{16}$$

Thus the stakes should be divided proportionally to the foregoing numerators.

To calculate the numbers $\binom{n}{k}$ Pascal noticed that the number of ways in which you can take $k+1$ things out of $n+1$ is made up of the number of ways in which you can take $k+1$ things out of n , together with the number of ways in which you can take k things out of n . Then, since all of n things or none of them can be taken each in just one way, the numbers can be got by the scheme known as *Pascal's Arithmetical Triangle*. We reproduce this in symbols to the left, in numerical values to the right:

$\binom{0}{0}$	$\binom{1}{0}$	$\binom{2}{0}$	$\binom{3}{0}$	$\binom{4}{0}$...	1	1	1	1	1	...
$\binom{1}{1}$	$\binom{2}{1}$	$\binom{3}{1}$	$\binom{4}{1}$...		1	2	3	4	...	
$\binom{2}{2}$	$\binom{3}{2}$	$\binom{4}{2}$...			1	3	6	...		
$\binom{3}{3}$	$\binom{4}{3}$...				1	4	...			
$\binom{4}{4}$...					1	...				
...						...					

Each number $\binom{n}{k}$ in the table is the sum of the number above it and the number to the left of it. The numbers $\binom{n}{k}$ for a fixed n all lie on a diagonal called by Pascal a base. In particular, the numbers $\binom{4}{k}$ all lie on the fifth base. Thus *A*'s chance is to *B*'s as 11 to 5.

We can admire the method the more when we remember that the theory of combinations had not then been studied, and that the binomial theorem was yet to be invented.

Roberval had difficulty in accepting Pascal's result, because, in the case under consideration, for example, the game might be decided before four rounds were played. It is quite evident, however, that the playing of the superfluous rounds could in no wise affect the result, so that it is legitimate to suppose them played. Pascal himself fell into the same error in criticizing Fermat's solution for three or more players.

Not long after this the invention of the differential and integral calculus absorbed the attention of mathematicians. In 1657, however, was published Huygens' *De Ratiociniis in Ludo Aleae*. Some fourteen propositions are proved, several of them dealing with *mathematical expectation*, i. e. the sum to be won multiplied by the probability of winning it. The treatise concludes by stating, without proof, the result of five rather difficult problems.

Wallis and Leibnitz write on combinations, but do not make applications to probability; while Halley and others begin to make investigations concerning the laws of mortality, thus laying the foundation for life insurance.

In 1713 appeared James Bernoulli's *Ars Conjectandi*, eight years after the death of the author. The work begins with a reprint of Huygens' treatise, adding the solutions of Huygens' five problems. It then develops very clearly the theory of combinations, making use of substantially Pascal's 'arithmetical triangle.' The binomial theorem for positive integers is proved, and formulae are derived for the sums of powers of the successive integers. The treatise concludes with the proof and some applications of what is known as *Bernoulli's Theorem*.

Consider the chances of ace in throwing a die. The probability that, in a sequence of five throws, a specific three shall be ace, and

the rest not ace, is $\left(\frac{1}{6}\right)^3 \left(\frac{5}{6}\right)^2$; so that (since there are $\binom{5}{3}$ ways of selecting the three) the probability of getting exactly three aces in five throws is $\binom{5}{3} \left(\frac{1}{6}\right)^3 \left(\frac{5}{6}\right)^2$. The probabilities of 5, 4, 3, 2, 1, 0 aces in five throws are thus given by the terms of the expansion of

$$\left(\frac{1}{6} + \frac{5}{6}\right)^5.$$

More generally, for an event of which the probability upon each of n occasions is p , the probability that the total number of its occurrences shall be $n, n-1, \dots, 2, 1, 0$ is given by the corresponding term in the expansion of $(p+q)^n$, where $p+q=1$.

Bernoulli proved that, supposing n an integer divisible proportionally to p and q , the greatest term of the expansion would be that containing $p^{pn}q^{qn}$. The proof is substantially that in the ordinary treatises on algebra.

This was a first step. He then showed that, by sufficiently increasing n , the sum of any fixed proportion of all the terms, the fixed proportion being so taken as to immediately precede and follow the maximum term, could be made to bear as large a ratio as one pleased to the sum of all the rest of the terms of the expansion.

Thus, if a coin be spun enough times, the probability may be made as near to unity as we please that the ratio of the number of heads to the whole number of spins will differ from $\frac{1}{2}$ by less than any assigned amount, however small. For instance, by sufficiently increasing the number of spins, we can make the probability against a deviation from $\frac{1}{2}$ by so much as $\frac{1}{1000}$ as large as 0.99 or 0.999, or any as near approach to unity as one may name.

If n, p, q have the meanings above assigned, we may, anticipating more modern results, indicate the character of the theorem with greater precision, thus:

It is over 2 to 1 that the number of happenings of the event shall not differ from np by more than \sqrt{npq} ; over 19 to 1 that it shall not differ by more than $2\sqrt{npq}$; over 700 to 1 that it shall not differ by more than $3\sqrt{npq}$; over 20,000 to 1 that it shall not differ by more than $4\sqrt{npq}$. Notice that while \sqrt{npq} , the standard deviation, constantly increases with increasing n , yet

$\sqrt{\frac{pq}{n}}$, the ratio of the standard deviation to the number of occasions, as constantly diminishes. Thus, a player at a fair game may expect at last such a run of ill luck as to sweep him off his feet, although all the time the ratio of losses to gains has been more and more nearly approaching unity.

Bernoulli's theorem is of great scientific importance as furnishing a measure of the degree of assurance which we are justified in feeling that the result of increased observation represents the truth with any proposed degree of accuracy (see Laplace's formula, further on).

While Bernoulli's work was lying in manuscript, Montmort and De Moivre published treatises along much the same lines.

Thus, among other matters, Montmort discusses Huygens' problems, solves the problem of points for two players of unequal skill, demonstrates the binomial and multinomial theorems for a positive integral exponent, and shows how to sum series, like the rows of the Pascal triangle, whose differences of a finite order are zero.

De Moivre likewise takes up the Huygens problems, solves the problem of points for any number of players, demonstrates the binomial theorem. But in solving certain problems, he is also led to make valuable investigations into the theory of recurring series. This theory he applies to the problem of the duration of play, that is, the problem of determining the probability that within a certain number of games one or the other of two players shall be ruined. Moreover, he is enabled to add to the precision and power of Bernoulli's theorem by the aid of Stirling's just discovered theorem for approximating to the continued product of the integers from 1 to n , when n is large.

Stirling's theorem asserts that approximately

$$1 \cdot 2 \cdot 3 \dots n = e^{-n} n^n \sqrt{2\pi n},$$

where $e = 2.71828\dots$ and $\pi = 3.14159\dots$. For example,

$$1 \cdot 2 \cdot 3 \dots 20 = 2\,432\,902\,008\,176\,640\,000, \\ e^{-20} 20^{20} \sqrt{40\pi} = 2\,422\,786\,385\,510\,400\,000.$$

The ratio of the two numbers is 1.004 17.

Now,

$$\binom{n}{k} = \frac{1 \cdot 2 \cdot 3 \dots n}{1 \cdot 2 \cdot 3 \dots k \cdot 1 \cdot 2 \cdot 3 \dots (n-k)},$$

and this, by Stirling's theorem, is

$$\frac{n^n}{k^k (n-k)^{n-k}} \sqrt{\frac{n}{2\pi k(n-k)}},$$

an immense simplification when n is large. If k is pn , the expression becomes (putting $1-p=q$)

$$\frac{1}{p^{pn} q^{qn} \sqrt{2\pi npq}},$$

involving, as is seen, the 'standard deviation'

$$\sqrt{npq}.$$

De Moivre also makes applications of the probability theory to the calculation of life annuities. Todhunter considers that none other save Laplace has done more for the theory.

Simpson's *The Nature and Laws of Chance* (1740) was practically an abridgment of De Moivre. In 1757, however, Simpson published a collection of tracts, among which is *An Attempt to show the Advantage arising by taking the Mean of a Number of Observations in Practical Astronomy*. Such is the beginning of the modern method for the adjustment of observations.

In 1738 Daniel Bernoulli introduces into the theory of probability the conception of *Moral expectation*. The value to a person of a small increment to his fortune he conceives to vary as the increment directly and as the fortune inversely. Thus a dollar by a person worth a thousand dollars would be valued a thousand times as much as by him who had a million. Putting x for the fortune, dy for the increment in moral value, and letting k be a constant, this gives $dy = \frac{kdx}{x}$; and so the

increase in moral value when the fortune increases from a to x is $y - y_0 = k \log \frac{x}{a}$.

Though in the usual applications of the theory of moral expectation no other law is used, it is evident that there might be others; that indeed to different persons, or to the same person at different times, there would probably be different laws in endless variety. Daniel Bernoulli himself does indeed, to some extent, consider the general case of y any function of x .

FECHNER'S LAW (q. v.) as to the intensity of sensation is precisely Bernoulli's logarithmic law, while the laws of increasing and DIMINISHING RETURNS (q. v.) in political economy, with the concomitant notions of marginal utility and disutility, embody his more general conception. Cf. MARGINAL INCREMENT.

He illustrates his theory by applying it to the *Petersburg Problem* as follows:—

A throws a coin into the air; if head

appears at the first throw he is to receive a shilling from B , if head does not appear until the second throw he is to receive two shillings, if head does not appear until the third throw he is to receive four shillings, and so on; required the expectation of A .

The mathematical expectation is

$$\frac{1}{2} + \frac{2}{2^2} + \frac{4}{2^3} + \frac{8}{2^4} + \dots \text{to infinity}$$

$$= \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \dots \text{to infinity} = \infty.$$

According to this A ought to give an infinite sum for the privilege of playing after this fashion with B . Yet who would give as much as £10? The meaning of the solution is that no matter how much A may pay, yet, if he can keep on playing and paying, at last—it may be next century, next millennium—yet surely at last there will be such a run of luck in favour of A as to reimburse him for all his losses.

Daniel Bernoulli's moral expectation for A , if the said A has a fortune of a shillings at the start, is approximately

$$(a+1)^{\frac{1}{2}}(a+2)^{\frac{1}{2}}(a+3)^{\frac{1}{2}}\dots - a,$$

which is always finite if a is.

Daniel Bernoulli's chief claim to remembrance, however, in the history of the subject, rests on his introduction of the differential calculus into the theory of probability. He also treats of the adjustment of observations, using the circle as a probability curve. His method, even were it founded on correct principles, is unmanageable in practice.

Euler wrote several memoirs on games of chance and lotteries, and also developed some formulae relative to life insurance.

D'Alembert is noted for his opposition to the theory. Thus, while the theory says that in two throws of a coin the possibilities are four, viz. HH, HT, TH, TT , making the probability of head at least once in two throws $\frac{3}{4}$, d'Alembert says that if head comes the first time there is no need of a further throw, so that the possibilities are three, viz. H, TH, TT , and the probability of head is $\frac{2}{3}$. Again, he would count small probabilities zero; he considers that every successive throw of head renders it more likely that the next throw shall be tail; he will not admit that the probability of head is the same when m coins are tossed simultaneously as when one coin is tossed m times in succession; he can even reason that because any event can either happen or not happen its probability is $\frac{1}{2}$.

He merely furnishes some of the many illustrations from the history of the theory that it is one in which it is extremely easy to fall into error; though it is difficult to understand how, upon points so simple and so fundamental, a man like d'Alembert could possibly have gone astray.

There is published in the *Philosophical Transactions of the Royal Society* for 1763 'An Essay towards solving a Problem in the Doctrine of Chances,' by Bayes. The theorem which he would establish is, using modern notation: If an event has happened m times and failed n times, the probability that its chance at a single trial lies between a and b is

$$\frac{\int_a^b x^m (1-x)^n dx}{\int_0^1 x^m (1-x)^n dx}.$$

The problem is stated with reference to the rolling of balls upon a billiard table. Instead of integrals he uses areas of curves. It is assumed that before the event all probabilities are equally likely. Consider a simpler problem in which the same principle is involved.

An urn contains five balls, an unknown number of which are white, the rest black. Six times in succession a ball is drawn at random from the urn and replaced. If a white ball is drawn each time, what is the probability that all the balls in the urn are white?

Plainly such a set of drawings may be made from urns containing one, two, three, four, or five white balls, the probabilities of the observed event in these cases respectively being

$$\left(\frac{1}{5}\right)^6, \left(\frac{2}{5}\right)^6, \left(\frac{3}{5}\right)^6, \left(\frac{4}{5}\right)^6.$$

If it now be assumed that urns of these five compositions are of equally frequent occurrence, then among 5^7 urns taken at random there would be 5^6 of each kind; and if six drawings were made from each urn, the number of times that the observed event (all six balls white) was to be expected would be

$$1, 2^6, 3^6, 4^6, 5^6,$$

in the case of the five compositions respectively.

Upon this assumption, then, the probability that the six drawings have been made from an urn all of whose balls are white is

$$\frac{5^6}{1 + 2^6 + 3^6 + 4^6 + 5^6} = 0.76163.$$

Our hypothesis is, as near as may be with

five balls, the same as Bayes' theory of all probabilities equally likely before the event.

But suppose the five balls were put into the urn by lot, that one had tossed a coin and each time that head showed had put a white ball into the urn; each time tail showed, a black one. The probabilities of the various compositions would be proportional to the numbers 5, 10, 10, 5, 1, and the probability that the six times repeated drawing of a white ball is due to the urn containing five white balls is now

$$\frac{5^6}{5 + 10 \cdot 2^6 + 10 \cdot 3^6 + 5 \cdot 4^6 + 5^6} = 0.35479.$$

It is difficult to see why the last assumption is not as reasonable as the other.

Nevertheless, the assumption of all probabilities equally likely *a priori* is that upon which the treatment of inverse probability, as started by Bayes and developed by Condorcet, Laplace, and Poisson, has been based. The assumption is critically discussed by Boole in his *Laws of Thought* (1853), and an adverse conclusion reached (cf. PROBABLE INFERENCE, 2). If we are given that an occasion A leads to an event B with probability p , that alone will not suffice to determine the probability that B , having happened, did happen on the occasion A . We need to know also both the antecedent probability of A and the probability of B in the absence of A . If these probabilities be denoted by a and c respectively, the sought

inverse probability is $\frac{ap}{ap + (1-a)c}$. Thus, it is more than a quarter of a million to one that a hand of four cards, if honestly dealt, shall not be four aces; but this tells us absolutely nothing as to the probability that, when four aces have actually been dealt, this result has been due to dishonesty.

Lagrange (1736-1813) wrote several memoirs upon the application of the theory of probability to the adjustment of observations. Considerable use is made of finite difference equations. Under certain arbitrary restrictions he derives a curve of errors, that is, a curve whose ordinates shall be proportional to the probabilities of the errors represented by the corresponding abscissae.

The naturalist Buffon, in his *Supplément à l'Histoire naturelle*, wrote in defence of Daniel Bernoulli's theory of moral expectation. He has a child toss a coin 4040 times to test the Petersburg Paradox. The coin showed head 2048 times, a deviation of 28 from 2020. A deviation as large as this is to be expected

38 times out of a hundred. Poisson, applying with much labour the theory of inverse probability, attempted to determine whether the deviation 28 was due to the imperfection of the coin. He finds it 4 to 1 that the coin favours head. But applying the same reasoning to a coin that on the first toss shows head, it would follow that it was 3 to 1 that the coin favoured head, an absurd result. The error is due to the fundamental fallacy involved in the arbitrary assumption (tacit or express) of some scheme of antecedent probabilities for the various possible causes of an event.

Buffon enriched the theory by problems involving geometrical considerations such as would now come under *local probability*. The following is famous:

A large plane area is ruled with equidistant parallel straight lines. A thin rod is thrown down. What is the chance that it shall fall across a line? If r is the length of the rod and a the distance between the lines, the probability is $\frac{4r}{\pi a}$.

Condorcet wrote a work entitled *Essai sur l'application de l'analyse à la probabilité des décisions rendues à la pluralité des voix* (1785). He attempts to show that the mathematical measure of probability is an accurate measure of our degree of belief. Satisfying himself as to this, he likens the obtaining of a man's opinions to the drawing of white or black balls from an urn. It is the computer's fallacy, so trusting to the machinery of computation as to neglect attention to the character of his data. If men were independent in their judgments, if each were right $\frac{5}{6}$ the time, then it would follow that a $\frac{2}{3}$ vote of a legislature of 300 members would be wrong just as often as you could expect 200 or more aces in throwing 300 dice; less than once in a million million times.

On the hypothesis of equal *a priori* probabilities, noticed above, Condorcet proves that if an event has happened pn times and failed qn , its probability is $\frac{p^{n+1}}{n+2}$. Thus, that the

sun shall rise to-morrow is very certain. But suppose, as has M. Bertrand, that one goes beyond the Arctic circle. If that be dismissed as fanciful, consider Laplace's calculation that it was 999,308 to 1 that the then received value for the mass of Jupiter could not be in error by so much as $\frac{1}{50}$. The perturbations of Juno proved that it was $\frac{1}{50}$ in error.

It remained for Laplace (1747-1827) to gather together all that had been done and to develop the science nearly to its present state in his *Théorie analytique des Probabilités* (1812). Much of the matter had appeared in various memoirs of Laplace written twenty-five years and more before. The mathematics of the work is remarkable for its difficulty. Among the more important results is the putting of James Bernoulli's theorem into a single formula.

We have seen, under the statement of Stirling's theorem, that approximately

$$\binom{n}{pn} = \frac{1}{p^{pn} q^{qn} \sqrt{2\pi npq}}.$$

Now, the most probable result on n occasions for an event of probability p is that the event shall happen pn times and fail qn times. That it shall do so the probability is

$$\binom{n}{pn} p^{pn} q^{qn} = \frac{1}{\sqrt{2\pi npq}}.$$

That, instead of this, an event shall happen $pn+x$ times and fail $qn-x$, the probability is

$$\binom{n}{pn+x} p^{pn+x} q^{qn-x}.$$

Laplace shows that, if n is large and x is small compared to n , this is approximately

$$\frac{e^{-x^2/2npq}}{\sqrt{2\pi npq}} = \frac{e^{-x^2/2\sigma^2}}{\sigma\sqrt{2\pi}},$$

where σ is the standard deviation \sqrt{npq} and e is the Napierian base 2.718... If x is large, the true probability and the approximate are each so small as to be negligible; and hence, though Laplace's formula then no longer stands in approximately the ratio unity to the true value, no practical harm is done by using the formula for the whole range of values of x , from $-\infty$ to $+\infty$.

By means of this formula we are enabled to compute the probability that, in a large number of trials, the deviation of the ratio of the number of occurrences to the number of trials from the ideal ratio (that which would be found in the long run) shall not exceed a given quantity. A general conclusion which is immediately inferrible from the formula is that *the deviation against which we are guaranteed with a given degree of probability is inversely as the square root of the number of trials*. Thus, if with n trials it is 1000 to 1 that the deviation does not exceed .01, then with $4n$, $25n$, $100n$ trials it is 1000 to 1 that

PROBABILITY

the deviation does not exceed .005, .002, .001.

Equate Laplace's expression to y , and we have the equation of a curve, the *normal probability curve*, whose ordinates at integral distances from the origin are the probabilities of the various possibilities on n occasions. To each value of σ corresponds a distinct curve. In Fig. 2, $y = \phi(x)$ and $y = 2\phi(2x)$ are the halves of such curves, for $\sigma = \sqrt{\frac{1}{2}} = 0.707$ and $\sigma = \frac{1}{2}\sqrt{\frac{1}{2}} = 0.354$ respectively. The area between the whole of either curve and the

The relation between the various curves is so simple that we need but one curve. Thus, if it be asked what is the probability of just 110 heads in 200 spins of a coin, we have $\sigma = 5\sqrt{2}$, $x = 10$. The probability is thus the ordinate for $x = 10$ in

$$y = \frac{e^{-x^2/100}}{10\sqrt{\pi}} = \frac{1}{10}\phi\left(\frac{x}{10}\right).$$

But this is one-tenth the ordinate for $x = 1$ in $y = \phi(x)$, or about 0.02.

x -axis is unity. The shape of either curve is defined by saying that the rate per cent. of decrease in y as we depart from the y -axis is proportional to the absolute value of x , or the rate per cent. of decrease in probability as we depart from the most probable is proportional to the amount of departure. The curve $y = 2\phi(2x)$ is got from $y = \phi(x)$ by simply halving the x 's and doubling the corresponding y 's of every point upon the latter curve. Thus A and D become A' and D' , while the shaded area $ADda$ becomes the area $A'D'd'a'$ without changing its value.

Note also that 0.02 is numerically the area between $y = \phi(x)$, the x -axis, and the ordinates at $x = 0.95$ and 1.05 , corresponding to the ordinates at $x = 9.5$ and 10.5 to $y = \frac{1}{10}\phi\left(\frac{x}{10}\right)$.

Similarly, the probability that the number of heads in 200 spins shall not differ by more than 10 from 100 is the area between the curve $y = \phi(x)$, the x -axis, and the ordinates at $x = \pm 1.05$. This is twice the area between the curve, the axes, and the ordinate at $x = 1.05$. Fig. 3 gives a curve $y = \Theta(x)$, whose ordinate for any x is numerically twice

PROBABILITY

the area between $y = \phi(x)$, the axes and the ordinate for the same x . The probability last mentioned is thus 0.88. The curve $y = \Theta(2x)$ bears the same relation to $y = 2\phi(2x)$ that $y = \Theta(x)$ does to $y = \phi(x)$. Tables of the values of Θ are given in most works on probability. Laplace was the first to suggest such tables.

To the standard deviation $\sigma = 5\sqrt{2}$ for $y = \frac{1}{10}\phi\left(\frac{x}{10}\right)$ corresponds the standard deviation $\sigma = \sqrt{\frac{1}{2}} = 0.707$ for $y = \phi(x)$. Fig. 3 shows that the probability of this not being exceeded is $dD = 0.68$.

The standard deviation is the square root of the mean squared deviation. Thus, if we had a great many sets of n spins each,

$$\sigma^2 = npq, = n \cdot \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}n$$

would be the average of the squares of the deviations from $\frac{n}{2}$ heads in the sets. But our 200 spins can be regarded as 20 sets of 10 spins each. The deviations from 5 heads in the 20 sets are

-1, 1, 3, 2, -1, 0, -2, 0, 1, -2,
0, 1, -1, -1, -1, 0, -4, 1, 0, 1.

Their squares are

1, 1, 9, 4, 1, 0, 4, 0, 1, 4,
0, 1, 1, 1, 1, 0, 16, 1, 0, 1.

The average is

$$\frac{47}{20} = 2.35, \text{ while } \sigma^2 = npq = 2.5.$$

The agreement would have been closer had we obtained the average by dividing by 19, one less than the number of sets.

Again, we may look upon the 20 sets as 20 observations to determine the probability of head. The value 0.485 of the probability got from the 200 spins is the same as the average of the values got from the 20 sets, i.e. from the 20 separate observations. The deviation from 5 of the number of heads in any set is replaced by the deviation from 0.485 of the corresponding probability. The sum of the squares of these divided by 19 will be the square of the standard deviation for a set. This comes out 0.0245 and $\sigma = 0.157$. Finally, σ_0 , the standard deviation for the mean of all the observations, is that for a single one divided by $\sqrt{20}$. This gives $\sigma_0 = 0.035$, and is very closely $\frac{5\sqrt{2}}{200}$. The same method can be applied to other sorts of observations. Thus, the edge of a table is measured twenty times, giving results as follows:

Measurements, inches.	Deviations from Average.	Squares of Deviations.
27.86	-0.07	0.0049
.87	-0.06	36
.90	-0.03	9

Aver. = 27.93 Sum of squares = 0.0742

$$\sigma = \sqrt{\frac{0.0742}{9}} = 0.062$$

$$\sigma_0 = \frac{\sigma}{\sqrt{20}} = 0.014.$$

If Bernoulli's theorem applies, 68 per cent. of the deviations should not exceed σ . There are 13 which do not.

The average of all the observations, 27.93, is that value of the measured quantity which makes the sum of the squares of the deviations a minimum and leads to the highest and narrowest probability curve. It was Legendre who, in 1805, suggested that the preferable value was the one which gives this minimum, and who used the name *method of least squares*. Adrain in 1808 deduced the probability curve from reasoning on the nature of errors of observation. Gauss did the same in 1809, and later gave still other deductions of the law of error. He it was who thoroughly developed the method, applying it not only to direct but to indirect and conditioned observations.

After all has been said, the proof of the validity of the method is that it works well in practice; works well if the observations are good, if the deviations are small. When this is not the case we try to get better observations.

As to the arithmetical mean, Ferrero has shown that the geometric mean, or any mean,

in fact, which treats all the observations on the same basis, leads to practically the same final results if the observations are good. If they are not, no mean can be relied upon. The arithmetical mean is the easiest to take.

There is no way of deciding beforehand whether the method will apply or not in cases in which the laws governing the production of the deviations or errors are unknown. There are classes of observations that follow laws of their own, and necessitate generalized probability curves and the superposition of curves. Their theory has recently been developed by Karl Pearson.

When deviation is normal, that is, when Bernoulli's theorem does apply, there may be two-way deviation, as in the firing of shots at

a target. We then have a probability surface whose sections perpendicular to the plane of the two ways of deviation are probability curves, and whose sections parallel to that plane are ellipses. The theory was thoroughly worked out by Brevais both for this and three-way deviation in 1846. The constants in the equations involve not only the sums of the squares of the deviations, but also sums of the products, two and two, of the deviations one way by those in the other ways.

Pearson has extended the theory to n -way deviation.

Probable Deduction: see PROBABLE INFERENCE (2).

Probable Error: see ERRORS OF OBSERVATION.

Probable Inference: Ger. *Wahrscheinlichkeitsschluss*; Fr. *inférence probable*; Ital. *illazione probabile*. Any inference which does not regard its own conclusion as being necessarily true (though the facts be as the premises assert).

In such an inference the facts asserted in the premises are regarded as constituting a sign of the fact stated in the conclusion in one or other of three senses, as follows: i.e. that relation of the premised facts to the concluded fact which is regarded as making the former a sign of the latter (1) may be such as

could not exist until the conclusion was problematically recognized; this is inductive or experimental inference. Such a relation (2) may be altogether irrespective of whether the conclusion is recognized or not, yet such that it could not subsist if the concluded fact were not probable; this is probable deduction. Such a relation (3) may consist merely in the premises facts having some character which may agree with, or be in some other relation to, a character which the concluded fact would possess if it existed; this is presumptive inference.

(1) The first case is that in which we begin by asking how often certain described conditions will, in the long run of experience, be followed by a result of a predesignate description; then proceeding to note the results as events of that kind present themselves in experience; and finally, when a considerable number of instances have been collected, inferring that the general character of the whole endless succession of similar events in the course of experience will be approximately of the character observed. For that endless series must have some character; and it would be absurd to say that experience has a character which is never manifested. But there is no other way in which the character of that series can manifest itself than while the endless series is still incomplete. Therefore, if the character manifested by the series up to a certain point is not that character which the entire series possesses, still as the series goes on, it must eventually tend, however irregularly, towards becoming so; and all the rest of the reasoner's life will be a continuation of this inferential process. This inference does not depend upon any assumption that the series will be endless, or that the future will be like the past, or that nature is uniform, nor upon any material assumption whatever. Cf. INDUCTION, and UNIFORMITY OF NATURE.

Logic imposes upon us two rules in performing this inference. The first is this: so far as in us lies, the conditions of the experience should remain the same. For we are reasoning exclusively from *experience*, that is, from the cognitions which the history of our lives *forces* upon us. So far as our will is allowed to interfere, it is not experience; so we must take pains that we do not, in taking the instances from which we are to reason, restrict the conditions or relax them from those to which the question referred. The second prescription of logic is that the conclusion be confined strictly to the question.

If the instances examined are found to be remarkable in any other respect than that for which they were selected, we can draw no inference of the present kind from that. It would be merely an infinitely weaker inference of the third kind (below). The present kind of inference derives its great force from the circumstance that the result is virtually predicted.

(2) The second kind of probable inference is, by the definition of it, necessary inference. But necessary inference may be applied to probability as its subject-matter; and it then becomes, under another aspect, probable inference. If of an endless series of possible experiences a definite proportion will present a certain character (which is the sort of fact called an objective probability), then it necessarily follows that, foreseen or not, approximately the same proportion of any finite portion of that series will present the same character, either as it is, or when it has been sufficiently extended. This is governed by precisely the same principle as the inductive inference, but applied in the reverse way. The same prescriptions of logic apply as before; but, owing to that being now inferred which was in the other case a premise, and conversely, it is not here true that the relation of the facts laid down in the premises to the fact stated in the conclusion, which makes the former significant of the latter, requires the recognition of the conclusion. This is probable deduction. It covers all the ordinary and legitimate applications of the mathematical doctrine of PROBABILITY (q. v.).

The legitimate results of the calculus of probability are of enormous importance, but others are unfortunately vitiated by confusing mere likelihood, or subjective probability, with the objective probability to which the theory ought to be restricted. An objective probability is the ratio in the long run of experience of the number of events which present the character of which the probability is predicated to the total number of events which fulfil certain conditions often not explicitly stated, which all the events considered fulfil. But the majority of mathematical treatises on probability follow Laplace in results to which a very unclear conception of probability led him. Laplace and other mathematicians, though they regard a probability as a ratio of two numbers, yet, instead of holding that it is the limiting ratio of occurrences of different kinds in the course of experience, hold that it is the ratio between numbers of 'cases,' or special

suppositions, whose 'possibilities' (a word not clearly distinguished, if at all, from 'probabilities') are equal in the sense that we are aware of no reason for inclining to one rather than to another. This is an error often appearing in the books under the head of 'inverse probabilities' (see that subject under PROBABILITY, where the view of Laplace is criticized).

(3) Probable inference of the third kind includes those cases in which the facts asserted in the premises do not compel the truth of the fact concluded, and where the significant observations have not been suggested by the consideration of what the consequences of the conclusion would be, but have either suggested the conclusion or have been remarked during a search in the facts for features agreeable or conflicting with the conclusion. The whole argument then reduces itself to this, that the observed facts show that the truth is *similar* to the fact asserted in the conclusion. This may, of course, be reinforced by arguments of some other kind; but we should begin by considering the case in which it stands alone. As an example to fix ideas, suppose that I am reading a long anonymous poem. As I proceed, I meet with trait after trait which seems as if the poem were written by a woman. In what way do the premises justify the acceptance of that conclusion, and in what sense? It does not necessarily, nor with any necessitated objective probability, follow from the premises; nor must the method eventually lead to the truth. The only possible justifications which it might have would be that the acceptance of the conclusion or of the method might necessarily conduce, in the long run, to such attainment of truth as might be possible by any means, or else to the attainment of some other purpose. All these alternatives ought to be carefully examined by the logician in order that he may be assured that no mode of probable inference has been overlooked.

It appears that there is a mode of inference in which the conclusion is accepted as having some chance of being true, and as being at any rate put in such a form as to suggest experimentation by which the degree of its truth can be ascertained. The only method by which it can be proved that a method, without necessarily leading to the truth, has some tolerable chance of doing so, is evidently the empirical, or inductive, method. Hence, as induction is proved to be valid by necessary deduction, so this presumptive inference must be proved valid by induction from experience.

The presumptive conclusion is accepted only problematically, that is to say, as meriting an inductive examination. The principal rule of presumption is that its conclusion should be such that definite consequences can be plentifully deduced from it of a kind which can be checked by observation. Among the wealth of methods to which this kind of inference (perhaps by virtue of its experiential origin) gives birth, the best deserving of mention is that which always prefers the hypothesis which suggests an experiment whose different possible results appear to be, as nearly as possible, equally likely.

Among probable inferences of mixed character, there are many forms of great importance. The most interesting, perhaps, is the argument from ANALOGY (q. v.), in which, from a few instances of objects agreeing in a few well-defined respects, inference is made that another object, known to agree with the others in all but one of those respects, agrees in that respect also. (C.S.P.)

Probation (in theology) [Lat. *probatio*, a test]: Ger. *Prüfung*; Fr. *épreuve*; Ital. *tempo di prova*. The state of moral trial in which the soul of man exists during the time that the offer of salvation is open to it.

The belief of the great majority of Christians is that probation ends with this life. The Catholic doctrine of purgatory is no exception, inasmuch as purgatory is conceived to be a place of purification, not of trial. The belief is entertained by many, however, that the period of trial does not end with death, but extends indefinitely into the future.

Literature: HODGE, Theology; DORNER, Christl. Glaubenslehre (1880); FARRAR, Eternal Hope; MARTINEAU, Christ. Dogmatics. (A.T.O.)

Problem [Gr. *πρόβλημα*, from *πρό* + *βάλλειν*, to cast]: Ger. *Problem*; Fr. *problème*; Ital. *problema*. (1) A question set forth for discussion with a view to a true and logically satisfactory answer; a 'dialectic theorem.' See Aristotle, *Topics*, I. xi. 101 b 1.

(2) A demonstrable practical proposition that something is possible. The solution usually consists in showing how it is possible and can be brought about. (C.S.P.)

Problematic [for deriv. see PROBLEM; the word was not in use in Gr. or Lat., though it may possibly occur]: Ger. *problematisch*; Fr. *problématique*; Ital. *problematico*. (1) The adjective imparting the lowest of the three grades of MODALITY (q. v.; see

also under POSSIBILITY) in the Kantian and derived systems of logic.

(2) In Greek it would mean pertaining to a problem; but the actual meaning, which is loose, is approximating to the import of an interrogation.

Sigwart and others maintain that problematic propositions are not propositions, because they are not assertory. If they are empty, their denials should be absurd, which does not seem to be the case. It is better to say that whatever presses as a question so much as to merit examination may properly be termed problematic. (C.S.P.)

Problematic Idealism: see SOLIPSISM.

Procedure (in law) [Lat. *procedere*, to proceed, through Fr.]: Ger. *Rechtsgang, Verfahren, Rechtsverhandlung*; Fr. *procédure*; Ital. *procedura*. The means provided by law for enforcing rights through the action of judicial or administrative tribunals. It includes all matters of process, pleading, practice, and evidence.

(2) The formal mode in which the functions of any branch of government are discharged.

Reformed procedure: an American system of simplified or 'Code' pleading, initiated in New York in 1848, and adopted in England by the Judicature Act of 1872.

In early societies rights often spring from forms. 'It would not be untrue to assert that in one stage of human affairs, rights and duties are rather the adjective of procedure than procedure a mere appendage to rights and duties' (Maine, *Early Hist. of Inst.*, lect. ix. 252. (S.E.B.))

Process [Lat. *procedere*, to proceed]: Ger. *Prozess*; Fr. *procès, processus*; Ital. *processo*. Continuous CHANGE (q.v.). (J.M.B.)

Process (mental): Ger. *psychischer Prozess*; Fr. *processus psychique* (or *mental*); Ital. *processo psichico* (or *mentale*). Continuous change in consciousness, or in mental disposition, or in both.

The continuity of mental process is of two kinds: temporal continuity and dispositional continuity, or continuity of interest. By temporal continuity is meant the fact that each state passes into that which succeeds it without a break in time. By continuity of interest is meant the fact that successive states of consciousness may be stages in the development of a single conative tendency. Continuity of interest may exist without continuity in time, and continuity in time may exist without continuity of interest. I can to-day resume a problem at the point where

I left it yesterday. In spite of the interval of time, yesterday's train of thought and to-day's have continuity of interest. Again, while meditating on my problem my attention may be diverted by the arrival of a visitor. There is temporal continuity between my mental processes in attacking the problem and in entertaining my guest; but there is discontinuity of interest. Continuity of interest constitutes in part the bond between one individual consciousness and another, which makes possible which is called the 'collective' mind. I may work at my problem up to a certain point, and then communicate my method and results to another. He may continue the same train of thought, and in his turn communicate his results to me. In this way we may solve the problem in co-operation. Our minds act as if they were one mind, so far as concerns the attainment of the end which we both pursue. This kind of co-operation in thinking and willing constitutes the psychical organism of human society, and binds together the successive generations of mankind. The process, however, though divided among different minds, is individual, not social. Cf. SOCIAL ORGANIZATION, SOCIAL PROCESS, and TRADITION.

Other forms of distinguishable mental process, such as cognition and feeling, have continuity also, which can probably in all cases be reduced to temporal merely (as emotional change produced by external events), or to dispositional merely (as in the continuity of a disturbed cognitive process), or to these two existing together. The further question of the reduction of all phenomenal continuity in change to a principle itself not subject to change, as well as the attempt to consider mental process as an independent system of self-produced changes, leads into metaphysics. (G.F.S.—J.M.B.)

Process (social): see SOCIAL PROCESS.

Proclus. (412–85 A.D.) Educated at Xanthus in Lycia, at Alexandria, and at Athens. Became a celebrated teacher, and died at Athens. The last of the Neo-Platonists to exercise any considerable influence. Cf. NEO-PLATONISM, and ALEXANDRIAN SCHOOL.

Procreation: see REPRODUCTION (in biology).

Prodicus. Born on the island of Ceos in the 4th century B.C. He was a teacher of virtue or the art of living, a Sophist, and taught for money at Athens.

Prodigality of Nature. Darwin's expression (*Origin of Species*) for EXCESS or

OVERPRODUCTION (q. v.) considered as a factor in the theory of evolution by NATURAL SELECTION (q. v.). See also EXISTENCE (struggle for). (J.M.B.)

Prodigy: see MONSTER, SPORT (with 'freak'), and MIRACLE.

Prodromata [Gr. πρόδρομος, running before]: Ger. *Prodrome*; Fr. *prodromes*; Ital. *prodromi*. Premonitory symptoms; minor symptoms preceding the outbreak of a disease. See PREMONITION (2). (J.J.)

Produce [Lat. *pro* + *ducere*, to lead]. To be a CAUSE (q. v.). A vague general term. Cf. the topics following (with their foreign equivalents); also INVENTION. (J.M.B.)

Producer: see PRODUCTION.

Production (and **Producer**, in aesthetics) [Lat. *productio*]: Ger. *Schöpfung*, *Produciren*; Fr. *production*; Ital. *produzione*. Used in reference to the point of view of the creation, as opposed to the appreciation or criticism, of a work of art; as in the phrases 'the producer's point of view,' the 'impulse of production,' &c. See ART AND ART THEORIES, and ART IMPULSE.

The contrasted point of view often referred to as that of the 'spectator.' (J.M.B.)

Production (in economics): Ger. *Produktion*; Fr. *production*; Ital. *produzione*. The creation of utilities; especially of utilities fixed and embodied in material objects.

The earlier economists (e.g. Malthus)

given. Some writers prefer to make exchange value rather than utility the criterion of wealth production; thus Walker, 'the production of wealth means the creation of values.'

There has been some question whether the rendering of services should be counted as production of wealth. In the case of a service rendered, production and consumption are indistinguishable in time. If we are measuring wealth as a fund, a service rendered does not imply a production of any more of that fund; if we are measuring it as a flow of enjoyment, the service rendered is a part of that flow. (A.T.H.)

Profit [Lat. *profectus*, increase, advance]: Ger. *Unternehmergewinn*; Fr. *benefice*; Ital. *profitto*. (1) Excess of price above cost.

(2) Specifically that excess which is due to the management of capital.

Down to the time of Mangoldt it was customary to divide the price of products into rent for land, wages for labour, and profits for capital. Profits were further analysed into interest, insurance against risk, and wages of superintendence. Mangoldt, Walker, Marshall, and others showed that interest and insurance on capital were true elements of cost; that the real profit was what had been called wages of superintendence. They thus divided price into four parts instead of three: rent for land, wages for labour, interest for capital, and profit for business management. (A.T.H.)

Prognathous skull of negro (somewhat emphasized).
(After Keane.)

Orthognathous skull of Kalmuck.
(After von Bauer.)

generally defined production as the creation of wealth. To meet the objection that man could create nothing, Mill answered that labour produced not objects, but utilities, and laid the foundation for the definition here

Prognathism [Gr. πρό, forward, + γνάθος, jaw]: Ger. *Prognathie*; Fr. *prognathisme*; Ital. *prognatismo*, *prognatia*. The projection or protrusion of the jaw in advance of the forehead.

This characteristic is regarded as significant zoologically in the evolution of the higher animals, and ethnologically in the differentiation of races. It is measured either by the FACIAL ANGLE (q.v.), or by the subnasal facial, gnathic, or alveolar index (Flower), which is the ratio of the length from the basion to the alveolar point, to the length from the basion to the subnasal point or nasion (lines BA and BN in the figure under CRANIOLOGY). When this index is below 98, the skull is orthognathous; when between 98 and 103, mesognathous; when above 103, prognathous. The figures illustrate the difference in appearance of prognathous and orthognathous skulls. (J.J.)

Prognosis and Prognostication: see PROPHECY, and MAGIC.

Progress [Lat. *progressus*, advance]: Ger. *Fortschritt*; Fr. *progrès*; Ital. *progresso*. Used loosely for any sort of continuous change towards a terminus, end, or ideal. It is opposed to regress, or change in a reverse direction (also loosely used). See the following topics. (J.M.B.)

Progress (economic). Increased command over the forces of nature for purposes of production, combined, as it generally is, with increased intelligence in utilizing the product for purposes of consumption.

Before the time of Malthus, increase in population would have been regarded as the clearest criterion of progress. After Malthus, population is relegated to the background as compared with production; for instance, in Mill's well-known treatment of the subject. The definition given is based on Bagehot's *Physics and Politics*.

The criterion accepted by most writers of the younger generation to determine whether an economic change did or did not represent progress, would be its effect on the survival of the community which adopted it, in the struggle for existence. (A.T.H.)

Progress (moral and social): see MORAL PROGRESS, and SOCIAL EVOLUTION AND PROGRESS.

Progressive: Ger. *progressiv*, *fortschreitend*; Fr. *progressif*; Ital. *progressivo*. (1) In medicine: progressive with regard to a disease indicates a gradual sequence of development, often with a predictable order of symptoms.

It serves, along with the words acute and chronic, to indicate types of onset and development of various diseases. Progressive paralysis (also termed general PARALYSIS, q.v., in the insane) is a well-recognized clinical form of

insanity in which sequences of stages of increasing debility and dementia occur. Progressive muscular atrophy is a gradual wasting of muscular tissue, beginning in certain muscle groups and extending in a more or less definite order to others. (J.J.)

(2) In logic: proceeding through a linear series in the natural order. Opposed to regressive, or proceeding in a reverse order.

Progressive method: the method which proceeds from generals to particulars.

Progressive sorites: a SORITES (q.v.) in which the premises are so arranged as to proceed from what is regarded as whole to what is regarded as part. See Hamilton, *Lect. on Logic*, xix. (C.S.P.)

Project [Lat. *proicere*, to throw forward]: Ger. *Projekt* (Sigwart); Fr. *projet*; Ital. *progetto*. (1) A possible course of action conceived simply, but not decided upon.

This follows the usage of Sigwart and Höfler (*Psychologie*, 518, 562), who make Projekt 'ein bloss vorgestelltes Willensziel.'

(2) That which is 'projected' in the second sense given under PROJECTION. (J.M.B.)

Projection: Ger. *Projektion*; Fr. *projection*; Ital. *proiezione*. (1) The spatial objectivation of objects in sense perception. See LOCALIZATION (in space).

This usage is vague and descriptive, varying from the mere recognition of a spatial datum to the hypothesis of the spatial projection of states at first purely 'inner' and unspatial. It is also complicated with the hypothesis (Leconte, for vision) that nervous PROJECTION (q.v.), to the periphery, sometimes extends out in lines at right angles to the sensitive surface.

(2) A stage in the genetic construction of objects antecedent to the conscious antithesis between subject and object. This meaning, suggested by Baldwin (*Ment. Devel. in the Child and the Race*, and *Social and Eth. Interpret.*), applies especially to the material of the consciousness of self. The project is considered in contrast with SUBJECT (q.v.) and EJECT (q.v.)—the latter terms designating later phases in the genetic process.

Literature to (1): JAMES, *Princ. of Psychol.*, ii. 31 (with numerous references); many citations in EISLER, *Wörterb. d. philos. Begriffe*, sub verbo (where projection is made equivalent to spatial localization). (J.M.B.—G.F.S.)

Projection (nervous, or 'eccentric'). (1) The property of the nervous system whereby

stimulations are referred to the periphery of the body or to the end-organs. Cf. LOCALIZATION.

There is considerable scepticism as to whether this is an original property of the nervous system. It is undoubtedly developed by experience, but may probably be considered as in some way having a rudiment in the nerve structure. (J.M.B.—G.F.S.)

(2) Projection system: see RADIATION.

Prolepsis [Gr. *προληψις*, anticipation; Lat. *anticipatio*]. A term of the Stoic philosophy denoting a concept derived immediately from perception. It was variously interpreted by ancient and mediaeval writers. Cf. Eisler, *Wörterb. d. philos. Begriffe*, 'Prolepsis.' (J.M.B.)

Proliferation (neural) [Lat. *proles*, offspring, + *ferre*, to bear]: Ger. *Zellvermehrung*, *Proliferation*; Fr. *prolifération*; Ital. *proliferazione*. The multiplication of nerve-cells by division of the pre-existing cells.

In an early embryonic stage such multiplication is very rapid, and is accompanied by mitosis. In these stages it plays a very important part in the formation of the peripheral nerves and their ganglia. Cf. CONCATENATION and the works there cited. Migratory neuroblasts form proliferating centres in various regions cut off from the ventricular epithelium. Recent writers (Herrick, Turner, Ayers) claim to find centres of permanent proliferation in older stages. The process is then apparently amitotic.

Literature: C. L. HERRICK, Notes on the Brain of the Alligator, J. Cincinnati Soc. Nat. Hist., xii (1890); Contributions to the Comparative Morphology of the Central Nervous System, J. of Compar. Neurol., i. (1891) 21; C. H. TURNER, Morphology of the Avian Brain, J. of Compar. Neurol., i (1891); H. AYERS, The Origin and Growth of Brain-cells in the Adult Body, J. of Compar. Neurol., vi (1896); W. HIS, Die Neuroblasten, &c., Abhandl. d. math.-phys. Cl. d. k. sächs. Gesell. d. Wiss., Leipzig, xv. 313-72 (1889), and Verhandl. d. 10. int. med. Congr., Berlin, ii (1890); C. S. MINOT, Human Embryol. (1892), and Merkel and Bonnet's Ergebnisse, vi (for 1896) (1897); S. PATON, in Contrib. to the Sci. of Med., dedicated to Wm. Henry Welch (1900); A. SCHAPER, Die frühesten Differenzierungsvorgänge im Centralnervensystem, Arch. f. Entwicklungsmech., v (1897). (H.H.)

Proof [Lat. *probare*, to prove, through Fr.; it translates Lat. *probatio*]: Ger. *Probe*; Fr. *preuve*; Ital. *prova*. An argument which

suffices to remove all real doubt from a mind that apprehends it.

It is either mathematical demonstration; a probable deduction of so high probability that no real doubt remains; or an inductive, i.e. experimental, proof. No presumption can amount to proof. Upon the nature of proof see Lange, *Logische Studien*, who maintains that deductive proof must be mathematical; that is, must depend upon observation of diagrammatic images or schemata. Mathematical proof is probably accomplished by appeal to experiment upon images or other signs, just as inductive proof appeals to outward experiment. (C.S.P.)

The entire psychological machinery of REASONING (q. v.) is the instrument of proof. The verb prove means to produce adequate proof, which may be either 'direct' or 'indirect,' according as the proof process consists or not of the direct application of a rule or statement to a particular case coming under it.

Literature: LANGE, as cited; VENN, Empirical Logic; JEVONS, Princ. of Sci.; systematic works on logic. See BIBLIOG. C, 1, b, and 2, j. (J.M.B.)

Propensity and Propension [Lat. *pro* + *pendere*, to hang]: Ger. *Neigung*, *Hang*; Fr. *propension*; Ital. *propensione*. A term used loosely for any sort of more permanent active TENDENCY (q. v.).

Martineau (*Types of Ethical Theory*, ii. chap. v) uses propensions to designate the 'primary springs of action,' i.e. 'organic appetites and animal spontaneity.' James discusses the 'religious propensities' in *Varieties of Religious Experience* (*Gifford Lectures*, 1901).

In view of the meanings given (q. v.) to DISPOSITION, PREDISPOSITION, TENDENCY, IMPULSE, APPETITE, this general usage seems best. (J.M.B., G.F.S.)

Proper (1) and (2) **Propriety** [Lat. *proprius*, one's own]: Ger. (1) *passend*, *anständig*, (2) *Angemessenheit*, *Anstand*; Fr. (1) *convenable*, (2) *convenances* (pl.); Ital. (1) *conveniente*, (2) *convenienza*. (1) Fit. See FITNESS (various meanings).

(2) Ethical and social FITNESS (q. v.); but especially restricted to the social, meaning strict conformity to social convention, custom, and expectation. (J.M.B.)

Property [Lat. *proprius*, one's own, belonging to; trans. of Gr. *ἴδιος*, a technical term of the Stoics, also of Gr. *ἰδιον*]: Ger. *Eigenschaft*; Fr. *propriété*; Ital. *proprietà*, *qualità*. (1) One of the logical PREDICABLES

(q. v.); that one of the five ways in which the predicate may be related to the subject (the others being genus, species, difference, and accident), which signifies that the predicate has inherent connection with the subject.

(2) Hence, in the ontological sense, any quality or attribute which flows necessarily from the nature of the thing possessing it—thus distinct from accident, which may or may not belong to a thing. Cf. SUBSTANCE. (J.D.)

Property (in economics): Ger. *Eigentum*; Fr. *propriété*; Ital. *proprietà*. (1) The right to call upon the organized force of society to prevent unauthorized persons from enjoying certain commodities. This right is called ownership.

(2) The specific rights or titles which are protected by the above sanction.

Theories of property may be grouped under four heads.

(a) The *jurists* have generally said that property is based upon *occupancy*: a bald statement of fact, which gives no reason why past occupancy should be made a bar to rights of present occupants.

(b) The moralists have generally said that property rights *ought* to be based upon *labour*. The *reductio ad absurdum* of this view is found in George's *Progress and Poverty*: 'Nature gives wealth to labour, and nothing but labour. She fills the sails of the pirate as well as of the merchantman or missionary bark. . . . The laws of nature are the decrees of the Creator.' In other words, it would appear that the pirate, in virtue of his hard labour, has as good a right to the proceeds of his toil as the merchant or missionary.

(c) This *Historical School* bases property right on the *constitution of society*. The exponents of this view say that property is not a thing by itself, but one institution among many. It exists because the law protects it, and would not exist under a different set of laws or social conditions.

(d) The *Sociologists*, while admitting the truth of the views of the historical school up to a certain point, insist that the law exists because it protects property; and that property right in its present shape is to be explained as a *necessary motive* in the struggle for existence between different communities. The law of property protects title by occupancy, because stability and permanence of tenure are essential conditions for good use of wealth; it attempts at the same time to give all possible advantages to the labourer

in becoming an occupant of his product, because in this way only is the fullest stimulus given to productive labour. (A.T.H.)

Psychologically, the 'acquisition impulse' (or 'instinct'), as it is called, seems to be very deeply rooted and to require recognition. Its existence is a refutation of the view which makes property rights conventional or artificial. Even among animals we find the recognition of a 'meum and tuum' not only towards other individuals, as for the young of the family, but also towards things. The bird claims the nest and even the whole tree as his own, and the dog guards his kennel with his life. In certain cases also, as the squirrel's store of food, it extends to provision for future needs. Certain birds, as magpies, also appropriate and claim useless objects as their own. In children this impulse develops very early. It must be counted a native tendency, though no doubt it owes much of its strength, and also the direction its development takes, to social example and precept. Its utility, from the genetic point of view, is so great—extending into all the details of personal life from the earliest period—that its survival and evolution would seem to be simply a great sociological fact. (J.M.B.)

Literature: WAGNER, *Volkswirtschaftslehre*, i.; see ECONOMICS. (A.T.H.)

Property (in law): Ger. (1) *Eigentum*, (2) *Eigentumsrecht*; Fr. (1) *biens*, (2) *propriété*; Ital. (*diritto di*) *proprietà*. (1) Whatever is the subject of ownership.

(2) The right of ownership. Cf. the preceding topic.

The essence of this right 'lies not so much in the enjoyment of the thing, as in the legal power of excluding others from interfering with such enjoyment' (Holland, *Jurisprudence*, chap. xi. 161). Public property: that belonging to the state or its governmental agencies. Private property: that belonging to private persons. Real property: in English and American law, land, and all rights arising from and annexed to land, which endure at least as long as the owner lives. Personal property: all other property, including a lease of land for any term of years, however long, not measured by the length of a life. Several estates may be carved out of the same property and held by different owners, as by the loan or lease of a thing, a pledge, a grant for life, or a conditional sale.

The Roman law divided property into *res corporales* and *res incorporales*. The test was whether it could be touched (*Inst. of Just.*, ii. 2, *de rebus corporalibus*, &c.). Modern

civilians divide it into *movable* and *immovable*, the latter embracing land and its incidents. See French *Code Civil*, Liv. II. tit. 1.

The air and the high seas are not the subject of ownership, although an act obstructing the right of another to their common use may be an actionable wrong. (S.E.B.)

Prophecy (in theology) [Gr. *προφητεία*, the gift of interpreting the will of the gods]: Ger. *Prophezeiung*; Fr. *prophétie*; Ital. *profezia*. Literally, prediction of future events; but in a larger sense, the organ through which a progressive revelation of divine truth is effected by means of inspired human agents called prophets.

In this larger sense prophecy is the human complement of inspiration. Through inspiration the prophet is informed with his revelatory message. The prediction of future events may or may not be a feature of prophecy in the more fundamental sense. The term prognosis is sometimes used as in general equivalent to prophecy.

Literature: KUENEN, The Prophets and Prophecy in Israel (London, 1877); EDESH-HEIM, Prophecy and Hist. in relation to the Messiah (London, 1885); WITSIUS, De Prophetis et Prophetia, Miscellan. Sacer, tom. i; THOLUCK, Die Propheten u. ihre Weissagungen (2nd ed., 1860); W. H. GREEN, Moses and the Prophets (N.Y., 1883); BRIGGS, Messianic Prophecy (N.Y. and Edinb., 1886). (A.T.O.)

Prophet: see PROPHECY.

Propitiation [Lat. *propitiatio*, from *propitiare*, to appease]: Ger. *Versöhnung*; Fr. *propitiation*; Ital. *propiziazione*. The act of placating a divinity who is supposed to be in a state of displeasure with the one who performs the propitiatory action. In Christian theology, that aspect of the Atonement by virtue of which it appeases the judicial wrath of God against the sinner.

Propitiation is to be distinguished from expiation, which is the suffering through which the propitiation is effected. Propitiation has direct reference to the divine wrath through which it is appeased. Expiation is more directly related to guilt. By expiating the guilt of sin the divine wrath is propitiated.

Literature: see ATONEMENT, JUSTIFICATION, and IMPUTATION. (A.T.O.)

Proportion [Lat. *pro + portio*, a part, a share]: Ger. *Proportion*; Fr. *proportion*; Ital. *proporzione*. (1) The aesthetically agreeable or harmonious relation to the whole of the unequal parts of any object.

Distinguished in this regard from symmetry,

which refers to the relation of like and equal parts, with emphasis primarily upon their relations to one another rather than upon their relation to the whole. Like symmetry, proportion is distinguished from harmony by reference to quantitative relations, whereas harmony refers rather to qualitative relations.

(2) Applied also to the relations of objects in their entirety to some norm, as illustrated by the expression 'well proportioned.'

The term proportion is applied, aside from objects of nature, most appropriately to sculpture, architecture, and painting as involving drawing; secondarily and more metaphorically to music, poetry, the drama, and the novel. It is sometimes used loosely and untechnically as implying mere adaptation, and occasionally even as synonymous with symmetry.

The history of proportion as an aesthetic category has been essentially identical with that of harmony and symmetry. Zeising and Köstlin afford illustrations of recent modes of analytical treatment of proportion. Cf. HARMONY, SYMMETRY, GOLDEN SECTION, and BALANCE.

Literature: KÖSTLIN, Aesthetik (1869); ZEISING, Aesthetische Forschungen (1855); DAY, The Sci. of Aesthetics (1893). (J.R.A.)

Proposition [Lat. *propositum*, from *proponere*, to place before]: Ger. *Satz*; Fr. *proposition*; Ital. *proposizione*. A JUDGMENT (q.v.) expressed in words.

The term judgment denotes an 'axiomatic concept' (Zindler, *Sitzber. Akad. Wiss. Wien*, 118, ix. 32) which it is difficult, if not impossible, to define; but for the purpose of logic a judgment may be said to be an association of experiences or elements of experiences which has been made an object of reflection by a conscious mind, and whose validity has been accepted by it. By an association is meant not merely a coexistence or a sequence, but an association of any complicated kind whatever, or any more or less explicit analysis of a mental whole into parts (cf. JUDGMENT). Thus *A conquers B* means that *A* is associated with *B* in the relation of conqueror, or that *B* is apprehended as *B* as conquered by *A*. Further, by an experience is meant any object of consciousness whatever, or any association of objects of consciousness; by the validity of the connection is meant merely its reality, or its occurrence in whatever universe, real or fictional or imagined, happens to be the background of the subject under discussion. (C.L.F.—J.M.B.)

Cf. the view of proposition given under

PROPOSITION

SUBJECT (in logic, 2), which is in certain respects different from what follows.

(C.S.P.—J.M.B.)

I. *The Import of Propositions.* It follows from the definition of the proposition that it must consist of at least three different members, two terms (between which the relation is said to hold) and another word whose function is to express at once the nature of the connection between them and the asseveration of that connection. (This double force of the copula is adverted to by Bradley, *Princ. of Logic*, 22.) In *Armies conquer countries*, we may think of *armies* and *countries* as the objects of consciousness, and of *conquer* as specifying the nature of the relation and at the same time asserting that it holds. But such a proposition as *A conquers B* can, if there is any occasion for it, be broken up differently, viz. into *A is one-of-the-conquerors-of-B*. Whether *B* or one-of-the-conquerors-of-*B* be regarded as the second of the related objects of consciousness is merely a matter of convenience, and will be determined in any actual case by considering whether other propositions, which it is desired to combine with this as data towards conclusions, have *B* or one-of-the-conquerors-of-*B* among their terms. Or, again, we can always decide which is for the moment the way in which we are regarding the proposition by considering whether in its inverted form it is the statement *B is conquered by A* or *One of those who conquer B is A* which interests us. To discover the three elements involved in *A runs*, we have, again, simply to invert it, *One who runs is A*. And the fact that there is no proposition which cannot be expressed in an exactly equivalent inverted form proves that this analysis of the proposition into two terms and a copulative connecting link is justified.

But there is one particular relation that we have by far the most frequently to deal with in reasoning—the relation of *b* invariably following upon *a*, or of *a* as the sufficient antecedent of *b*. This relation is variously expressed in words—*a* is-followed-by-*b*, *a* implies *b*, *a* is-indicative-of *b*, *a* is-a-sufficient-condition-of *b*, If *a* then *b*, The objects *a* are-included-among the objects *b*, or All *a* is *b* (where *a* and *b* may themselves be propositions, instead of simple terms, without altering the essential character, for logic, of the relation). In order to hold this relation present in consciousness in its purely abstract form, freed from all those variations of language which, rich in

meaning though they may be, are entirely inessential to the purposes of logic, it is absolutely necessary to represent it by some symbol. Formal logic, as ordinarily treated in the books, is only semi-formal. It has been agreed, since the time of the earliest writers upon the subject, to allow terms to enter into propositions shorn of the special implications which follow upon their different meanings, and to represent them by colourless letters of the alphabet; it is only carrying this admirable device for abstracting from the inessential a little further if we represent the simple copula of *All a is b* by some symbol. We shall make use of the form \leq , a modification of that suggested by Peirce, for this purpose, and we shall write $a \leq b$ for any one of the copulative relations which have just been variously put into words. De Morgan regards this relation as sufficiently characterized by the fact that it is transitive, but that is a statement that needs modification. We shall then have for the formal representation of *Not all a is b* (corresponding to the plan of indicating *what is not a* by \bar{a}), the same sign with a horizontal mark indicating negation over it, as $a \leq \bar{b}$. It will also add greatly to facility of expression if we write ∞ and \circ for the SPECIAL TERMS (q. v.) of logic, *everything* and *nothing* (or what exists and what does not exist). Innovations are difficult to make, and there was long and strenuous opposition to the introduction of the special quantity \circ into arithmetic and algebra; but it seems that the time has come when these simple aids towards extracting the essential from the accidental in logic should be used. Cf. SYMBOLIC LOGIC, ad fin., and TERM (negative).

This view, that the import of the proposition is to affirm some sort of connection between two objects of consciousness, dates from Aristotle. A favourite view of recent years is to maintain that in the simple judgment, *A is B*, there is both an analysis and a synthesis—that *A as being B* is given first, as an integral element of consciousness, and that the work of forming the judgment consists in first separating the concepts and then reuniting them by means of the connecting copula (cf. JUDGMENT). This is doubtless a correct account of the manner of forming immediate judgments, but it is not correct as a description of propositions. The examples of the proposition which are usually studied by the logicians are so cut and dried that it is difficult to detect its real essence; it is necessary to consider it in the process of being

formed, to see what it is really like. The act of the mind in the presence of such a situation as occurs in the following incident may be taken as the typical instance of the judgment: 'A prelate said, "My first penitent was a murderer"; a distinguished nobleman entered the room at that moment, and, after greetings, remarked to the assembled company, "You may not know that I was His Eminence's first penitent."' In the presence of two premises like this, we do not first get the nobleman and the murderer fused together in a mental content and then separate them in order to reunite them; but the two premises being held before the mind as a mental whole (that is, it being recognized that they hold good at one and the same time and place), an instinctive excision of the common element takes place, and the hearer finds himself forced to accept the hitherto unsuspected relation 'This nobleman is, then, a murderer!' (that is, the nobleman and murderer are, in this instance, one and the same object). It is the two premises—and, after they have been in part restated in the conclusion, it is this proposition—which brings about for the mind of the reasoner the conviction that the two descriptions appertain to one and the same object; that is, there is produced in his mind the complex conception 'this nobleman as being a murderer.' Expressed logically, it is through the compelling force upon the human mind of the fundamental principle of the syllogism (Sigwart), or it is, in psychological terms, through the irresistible impulse of the mind for *putting this and that together* when a common element (in this case 'first penitent') leads to their inclusion in a larger whole, that this proposition comes into consciousness. It is only after the two premises and the conclusion which they involve have effected the junction, for the hearer, of nobleman and murderer that the 'immanence' for consciousness of the one in the other exists, in a way which may then be explicitly declared in words (proposition). (C.L.F.)

The difference of view on this subject is probably to be accounted for by the distinction between judgment and proposition, especially when that difference is accounted for genetically by the 'communicative' or 'declarative' function of language. The normal psychological process seems to be the formation of judgment by the acceptance of an enlarged (synthetic) whole of mental content, and then the rise of proposition, in words, by analysis and for communication; this in the mind of the

speaker. But in the mind of the *hearer*, to whom the relation expressed in the proposition is new, this procedure is apparently reversed: two more or less familiar terms are given to him in language, joined in a certain relation; and he, by accepting this relation, forms a new judgment. The logician, if he restrict himself to the point of view of the hearer, should deal strictly with propositions and their communication from one mind to another, holding that they are always synthetic; the psychologist, approaching the proposition from the point of view of mental process and meaning, finds that the proposition is always the analytic issue of an earlier judgment. Even when the hearer *hears* the proposition '*a* is *b*,' it is not *his* proposition until he has gained the judgment *ab* and recognized the relation of the parts *a* and *b* to each other or to the whole. (J.M.B., C.L.F., G.F.S.)

The nature of the relation between terms which is expressed by the simple copula of *All a is b*, $a \leq b$, has been variously taken to be (1) the inclusion of the group of objects represented by *a* among the group of objects represented by *b*; (2) the implication of the sensations or ideas *b* by the sensations or ideas *a* (Mill); or (3) the attachment to the group of objects *a* of the qualities involved in the meaning of *b*. (The purpose of any given asseveration is either to make an addition to the groups of objects already known to have the quality *b*, or else to add to the qualities already known to be possessed by the objects *a*; we can indicate by the emphasis whether we mean, for instance, '*Man* also is a primate,' or '*Man* is a *primate* also.' So Venn and Baldwin.)

The reason that so many different views on this matter are possible would seem to be very simple: every term is a double-edged machine—it effects the separating out of a certain group of objects, and it epitomizes a certain complex of marks. It follows that no one of the above accounts of the nature of the proposition is complete; any statement involves in full a fourfold implication. Whoever says, for instance, that 'All politicians are statesmen' must be prepared to maintain that the objects politicians are the same as some of the objects statesmen, and are in the possession of all of the qualities of statesmen; and also that the quality-complex politician entails the quality-complex statesman, and is indicative of the presence of some of the objects statesmen. It is open to the psychologist to show that in any given instance one

PROPOSITION

or the other of these several meanings is what the speaker has most prominently in his mind, and we are able to put the abstract copula of $a \leq b$ into such a form of words as shall accentuate now one and now another of them (as, *The a's are included among the b's, Being a entails being b*); but from any one all the others can immediately be inferred, and hence, for the logician, the full content of the proposition involves them all. In dealing with this subject, logicians have been in the habit (as Keynes remarks) of committing the fallacy of exclusiveness, that is, of denying that one side of the shield is silver, on the ground that one side of the shield is gold.

The same doctrine is applicable to the compound proposition. *If a is b, c is d*, means that the instances of *a* being *b* are included among the instances of *c* being *d*, and that the truth of *a* is *b* entails the truth of *c* is *d*. The two different meanings are severally made prominent in *Whenever a is b, c is d* and *If a is b, c is d*; the former is more apt to be of empirical origin and the latter to be derived from other propositions, but either follows from the other, and hence, for logic, each is equivalent to the other. Writers on symbolic logic sometimes (Schroeder, Venn) develop the subject in terms of class-inclusion only (McColl in terms of implication only), and seem to think that some necessary connection is herein involved. But in doing this they have alienated the logicians of the regular school, not unnaturally, and they have introduced perfectly needless restrictions; $ab \leq o$ means not simply that the class ab does not exist, but also that *a's* which are *b's*, *b's* which are *a's*, and *things* which are both *a* and *b* are all non-existent. It is true that to use the *language* of one or the other of the several meanings of the proposition is almost unavoidable, but the class-meaning and the attribute-meaning carries each the other with it; they are, like the gold and the silver sides of the shield, inextricably welded together. Herein appears the great advantage to be gained by the free use of the generalized copula $a \leq b$, which is defined as indicating explicitly all four of the implications; there is no form of words which does not seem to commit us more or less to one or the other of them, to the exclusion of the rest.

The metaphysician is able to think away all reference to an objective world, and to regard his experiences as merely ordered sequences among the elements and combinations of elements of his own consciousness.

But the hypothesis that there is an objective reality standing in a one-to-one correspondence to this play of elements of consciousness is deeply ingrained in the human mind, and it is inextricably involved in our forms of utterance. Every term used to mark out an element of consciousness and to aid in conveying an intelligible statement to the listener posits the application to certain portions of reality (even the subjective world of the utterer is part of the objective world of the receiver), as well as giving him marks by which to recognize them. This reference to reality is implicitly present in every proposition; in some propositions it is present explicitly. In *Everything is material, All is vanity, Whatever is, is right, Everything is toil and trouble, Alles ist Gefühl*, the subject of the proposition is the whole of the universe, whatever it may be which is the subject of discourse. But any proposition can be immediately thrown into the form in which this reality reference is explicit. *All a is b* is the same thing as *Everything is \bar{a} or b*, or $(a \leq b) = (\infty \leq \bar{a} + b)$ (where the symbol $+$ is used for the word *or*). This fact has led some writers to define the proposition as a 'description of reality,' and to say that reality is the 'real subject' in every proposition. This leads us to the consideration of the distinction between subject and predicate (for in the equivalence just stated, *a*, which was subject, has become an element of the predicate). When, e.g., *A* and *B* are alike individuals, what is the difference between *A is B* and *B is A*? A proposition, in its living form, is something which is set up—proposed—by the utterer for the acceptance of the receiver; the former throws into his subject all that he knows the latter is already willing to grant him, and to this he adds in the predicate what constitutes the new information to be conveyed by the sentence. The difference becomes patent in such sentences as these: *The large round red-covered table at which he is writing is dusty*; *The large round dusty table at which he is writing is covered with red*. The utterer chooses the first of these sentences when he knows that the receiver has noticed all the other determinants of the table—that to tell him of them would be throwing time away—but that he has not yet noticed that the table is dusty. All the part of the sentence before the *is* is thrown in to enable the receiver to pick out with certainty the object which is referred to; what

comes after the *is* is the matter freshly added. In the second sentence it is the knowledge that the object marked out by all the words of the subject is covered with red which is about to be introduced into the receiver's mind. In *A is B* we say, 'I know that you know who *A* is, perhaps you don't also know that he is the same person as *B*.' Now, the sentence $\infty \leq \bar{a} + b$, *Everything is non-a or b*, is correctly called a description of reality; but in the form *Everything which is a is b*, that is (to put in explicitly the implicit reference to reality), $\infty a \leq \bar{b}$, it is not ∞ , or the actual, which is being described, but only a limited portion of it, namely, so much of it as is *a*. It is, therefore, not correct to say that the proposition is a description of reality; it is such only when it is in a certain form. A proposition is a 'description' of whatever may chance to be its subject. It would be just as correct, and no more so, to say that every universal proposition *is* an affirmation of non-existence, because it can be thrown into the form $a \bar{b} \leq 0$. It is that, but it is something more. Bosanquet says that the real subject of discourse in any proposition is 'outside' the proposition; it would be more correct to say that only part of that outside term is the subject, except after the proposition has been thrown explicitly into the form $\infty \leq \bar{a} + b$. There is no one form of a series of equivalent proposition which gives their 'real' meaning; their real meaning can only be got by considering all their forms. (See below, pp. 368-9.)

II. *Kinds of Propositions.* Propositions are divided as regards the source of their validity into (1) empirical, (2) immediate, (3) derived.

Empirical propositions are the results of valid inductions. Immediate propositions are of several different kinds: (a) axioms, (b) postulates, (c) definitions, (d) verbal propositions, (e) propositions of immediate perception. (a) Axiomatic propositions are probably also empirical in the last analysis, but they are the result of such early experience, and they have become so deeply embedded in all our knowledge, that they are practically indistinguishable from what they would be if they were innate. (b) Only general propositions are properly called axioms; particular propositions, affirming existence, are postulates, as—what Poincaré calls a fundamental postulate of mechanics—something is constant, or the fundamental postulate of logic, something exists, or the postulate of geometry, figures can be superimposed. (c) With de-

finitions or definitive propositions belong also any general assumptions temporarily taken for granted within a given argument. (d) Verbal propositions merely set forth in the form of explicit copula and predicate what has been already taken for granted in the meaning of the subject. 'What is taken for granted' is, of course, a term relative to the intelligence and knowledge of the person addressed, but it must always include at least the indispensable signification of the subject, that is, so much as is involved in its definition. (These propositions are also called—by Kant—analytic, but a less dignified name is preferable for propositions whose nature it is to be trivial.) Both 'real' and 'verbal' statements are *non-formal*; that is, the distinction is one that cannot be made until it is known what *a* and *b* stand for in $a \leq b$. Besides these there is a different sort still, which is valid (or not), quite independently of the meaning of the terms, as *a is always a*; *That a is b is the same thing as that non-b is non-a*. (e) These are usually singular propositions, as 'I feel cold at this moment,' and are not of frequent use in arguments. The essential characteristic of a proposition (1) is that it can be proved, but only by induction, which is more or less uncertain, and liable to overthrow as knowledge advances; a proposition (3) can be derived deductively from (1) or (2) or both together, and its degree of validity depends upon that of its premises; a proposition (2) cannot be proved at all. The axioms are frequently regarded as being necessary; they are certainly essential to our continuing to think without being overcome by mental dizziness and nausea. Sigwart regards all derived propositions as necessary (*Logik*, 2nd ed., 210), but those derived purely or in part from empirical propositions are surely not so—nothing can have greater validity than its source.

Propositions are simple, complex, or compound. A simple proposition is one in which the grammatical subject and the grammatical predicate are regarded each as a single logical term. In a complex proposition the subject or predicate, or both, are broken up, in the course of the argument, into separate elements, as when 'The undevout astronomer is mad' is transformed into 'Any astronomer is either devout or mad.' A compound proposition is a statement in which one, at least, of the terms is itself a proposition: as, *Never do mortals sin that angels do not weep*; *That some a is b and not any a is b should both be*

PROPOSITION

true is impossible. The latter is a doubly compound proposition.

III. *The Existence of Terms.* Do universal propositions imply the existence of their subjects? From *All a is b*, are we safe in concluding that *a's* exist? The answer to this question is that in the statements of real life there is no general rule. For the most part we should regard it as waste of time to speak much about things which do not exist, yet we can say *All disobedience is punished* without in the least asserting that disobedience ever occurs. But in formal logic, where terms have become *a* and *b* and we know nothing about the meanings of our concepts, it is necessary to adopt some fixed convention in this matter; if any implications of this sort are made by propositions in general, we must know exactly what they are and be able to state them explicitly. The convention which many logicians accept is this: *Some a is b*, since it affirms the existence of *a* which is *b*, must be taken as implying the separate existence of both *a* and *b*. But in the case of *No a is b*, there is no difficulty whatever in admitting that one way in which it may become a valid statement is by our knowing that *a* or *b* (one or the other) does not exist at all. Moreover, it is indispensable that we should have in logic propositions that are the exact denials of each other; and hence if *Some a is b* is taken as meaning *Some a is b, and a and b both exist*, we must mean, in full, by *No a is b* that *No a is b or else a or b is non-existent*. It follows that *No a is b* cannot be taken as asserting the existence of either *a* or *b*. It is, however, an error to say that it makes no implication of existence; if there is no *a* which is *b*, then everything must be either non-*a* or else non-*b* (unless we are taking account of that imaginary universe in which nothing exists), and hence certainly either non-*a* or else non-*b* must exist. So in the proposition *All that is non-a is b*, we do not assert the existence of non-*a*, it is true; but the proposition is exactly equivalent to *All but a is b*, and this certainly affirms that *a* or *b*, one or the other, exists. On the other hand, the immediate denial of this last, *Not all but a is b*, though a particular proposition, makes no affirmation in regard to the terms that explicitly enter it; but it is equivalent to *Some non-a is non-b*, and hence it does affirm, by a necessary implication, the existence of both non-*a* and non-*b*. Hence the rule that is sometimes stated—particular

propositions imply the existence of their terms, universal propositions make no implication in regard to the existence of their terms—is not correct. If it is said, for instance, that all is vanity, things that are vanity are certainly affirmed to exist (if anything exists). If the rule is limited to subjects—i.e. that particulars imply, while universals do not imply, the existence of their subjects—then it is true except in the case of two of the particular propositions of the complete scheme, *Not all but a is b* and *Some besides a is b*; but it does not give us all the information in regard to existence that we have the right to demand of the logician. The complete rule is this: *Express every universal proposition in the equivalent form, All but x is y, and every particular proposition in the equivalent form, Some x is y; then the particular proposition affirms the existence of both x and y, and the universal proposition affirms the existence of either x or y.* With this convention it is to be noted that *Some a is b* does not follow from *All a is b*, except with the aid of the explicitly stated minor premise, *There is some a*. [In most cases, however, the existence is not 'asserted' explicitly, but rather taken for granted. It should be added, also, that on another view, there is absolutely no difference between universal and particular propositions in the matter of their reference to existence; and much may be said for such a view.—J.M.B.]

A large amount of bad reasoning has been expended upon the question of the existence of terms, mostly due, of course, to the non-comprehension of what those who uphold the above doctrine mean by existence. The word is unfortunately chosen, for it has unavoidable metaphysical and psychological implications which invite confusion; existence in the sense of being something that we are capable of thinking about must of course belong to every term that is an element of a comprehensible statement, but that is not the sort of existence that the logician has in mind. It would be better to substitute for it the word *occurrence*, meaning occurrence within that field of thought which the speaker is talking about (see *UNIVERSE OF DISCOURSE*); when we say *Nothing has happened*, we do not mean to assert that nothing has happened within the planet Mars, nor that nothing has happened among the microbes. The word occurrence has the additional reason for its use that nothing else is possible in speaking of compound propositions (to which the above

doctrine is wholly applicable). When we deny *If a is b, c is d*, we affirm the (actual or possible) occurrence of *a is b* in conjunction with *c is not d*, and hence, all the more, the (actual or possible) occurrence of each in itself; but when we affirm it, we do not affirm that *a is b* ever occurs, but only that what is sure to occur is the *alternation* of either *a is not b* or *c is d*. There is an admirable and exhaustive discussion of this topic in Keynes' *Formal Logic*, chap. vii, Part i, 3rd ed., which ought to render further misconception impossible.

The correct doctrine in regard to subjects of propositions, though often overlooked, is of early date. Petrus Hispanus says (see Prantl, *Gesch. d. Logik*, iii. 61) that *omnis* in the major premise of a syllogism does not imply the actual existence of the objects which it sums up. It should be added that when we know the meaning of our terms and the sources of our propositions, we often have more knowledge than this about existence; if the proposition is empirical, there is usually implication of existence, as All roads lead to Rome; if it is derived from the axioms and fundamental principles of any science or of real life, there is not, as *Whatever gods there are*, are just.

The psychologists (if not the logicians) are right in saying that in the predicate the reference to objectivity, though implied, is not explicitly in the mind of the speaker; but that is accounted for by the application of what is frequently referred to as the *principle of parsimony*. It is sufficient if a single term carries the objective reference for the whole sentence, and to repeat this reference explicitly in the predicate would be tautologous. It is not predicates only which are without it, but also all elements of the subject, except one; thus we cannot think of *ab*, in $ab \leq c$, *architect-bankers are clever*, except as architects who are bankers, or as bankers who are architects, or as *things which* are at once architects and bankers. In citizen-student and student-citizen, only one word is a noun and the other is practically an adjective. (Wundt writes them, to indicate this distinction, cS and sC respectively.) The predicate-word, then (just like the determinant-word), though fully capable of bearing the reference to reality, has it, in general, only in abeyance. In contraposition, where subject and predicate change places, the reality-reference remains in the subject, $\infty s \leq c$ becomes $\infty \bar{c} \leq \bar{s}$ (*Whatever is a student is*

a citizen becomes Whatever is a non-citizen is a non-student). Adjectives arise, in general, as predicate-words, but they may at any moment become, by themselves, subject-words, by throwing in the proper special term to carry them, as *Things which* are blue are cold. An adjective and a noun each represents a mental experience of more or less complexity held for the moment to be integral; the source of their difference is to be found in the doctrine of 'natural kinds' (see KIND). All the subjects of x constitute the application of x , and all the predicates of x constitute the signification or the implication of x ; now adjectives are, in general, words of wide application but of very little implication, but nouns, on the other hand, are the names of natural kinds of great depth. We can say, e. g., *Things which are white are the brightest things in the field of view*, *Things which are white do not fade*, *Things which are white are easily soiled*, *Things which are white are suggestive of purity*, and that is almost all. The word represents a term of extremely little depth; *being white* has almost no further implication. It is for this reason that in the constructing of language it has remained solely an adjective. It is not the case that a word is a predicate-word because it is an adjective; it is an adjective because it is (owing to its little depth) almost exclusively a predicate-word.

The attempt to introduce propositions with quantifical predicates into formal logic has been over and over again shown to be a mistaken one; such a proposition can always be expressed in terms of two propositions of the regular scheme.

IV. *The Scheme of Propositions*. The proposition in *is* will usually contain, besides its essential elements, two modifying words, one of quantity and one of quality, as

Some $| a |$ is $| \text{not} | b$,

and will thus consist in all of five constituents of different sorts. *Some* and *all* are indicators of particular and universal quality respectively; *not* and *the absence of any word* are what stand respectively for negative and affirmative quality. These several indicators may be treated by the logician as separate proposition-elements (and usually are so treated), or their implications may all be thrown into the copula, and we shall have thus what may be called the *figured* copula, as *a is-wholly b*, *a is-not-wholly b*. In the compound proposition this is the regular mode of expression; we say *p is-indicative-of*

q. That *a* is *b* is-not-incompatible-with *c* being *d*. Different symbolic copulas (modifications of \leq) may be devised for all the different relations of this sort, and the transformation from one to another may be made by mechanical rules. How many of these essentially different relations are there? The ordinary logic recognizes only four, and of these one is to a certain extent recalcitrant to rule, for the reason that it is in fact a member of a different scheme. Instead of *Some a is-not b*, we ought to express this member of the group of four as *Not all a is b*. This is the form in which it appears in Aristotle, and it frequently retains this form in the works of the schoolmen, as appears in the fact that the symbolic letters which stand for the several propositions, *A*, *E*, *I*, *O*, are said to be (but upon perhaps insufficient authority) the characteristic vowels of $\pi\acute{\alpha}\varsigma$, $\alpha\upsilon\delta\epsilon\iota\varsigma$ ($\alpha\upsilon\delta\epsilon\nu$), $\tau\iota\varsigma$, $\alpha\upsilon$ $\pi\acute{\alpha}\varsigma$ (Prantl, *Gesch. d. Logik*, xv. 277, and iv. 153-4). The propositions admitted into any scheme should be propositions which are the immediate denials one of another, as *Some a is b*, *Not any a is b*. Pairs of immediate denials are

- (*a*) All *a* is *b*,
(\bar{a}) Not all *a* is *b*,

and

- (\bar{m}) *Some a is-not b*,
($\bar{\bar{m}}$) *No a is-not b*.

Either (*a*) and (\bar{a}) should be regarded as the canonical forms, or else (\bar{m}) and ($\bar{\bar{m}}$); to mix them up, as is done, is a pity, for the rules for TRANSFORMATION (q. v., in logic) apply very differently to the incongruous pair (*a*) and (\bar{m}), and hence much confusion arises. The right pair to choose is, of course, (*a*) and (\bar{a}); *All that glitters is gold* is properly denied by *Not all that glitters is gold*.

The actual number of different statements that are possible in terms of *x* and *y* and their contradictory terms \bar{x} and \bar{y} (excluding double negatives) is eight. This is at once evident if we express everything that can be said in the form of propositions of existence and of non-existence; thus the combinations of *a* and *b* and their negatives are *ab*, $\bar{a}\bar{b}$, $a\bar{b}$, $\bar{a}b$, and since each one of these combinations can be said to exist (a particular proposition, *There is some a which is b*, or *Some a is b*) or to be non-existent (a universal proposition, *There is no a which is b*, or *No a is b*), it is evident that eight different statements of fact are possible. These, of course, remain different, no matter what the form in which they may be expressed. One reason why logic

commonly recognizes only four out of this set of eight is that it has fought shy of negative terms, and especially of negative terms as subjects. This is strange, because Aristotle gives, in his most fundamental group of propositions (those in one term only), four with negative subjects, as *Not-a exists*, *Not-a exists not*, &c. It is, however, De Morgan to whom we owe not only the generalization of the copula (which, he says, he has 'made as abstract as the terms'), but also the full introduction into logic of negative terms as subjects as well as predicates, and the setting out of the eight propositions of a complete scheme. De Morgan did not, however, devise appropriate copulas for the several statements to be made; but one does not have to search far, in the language of real life, to find such, and when they are found, the eight things to be said can all be said by means of them, very simply, without the use of any negative terms whatever. The letters *A*, *E*, *I*, *O* being no longer adequate, we may take *i* and *o* and their negatives to stand for the symmetrical copulas—those in which subject and predicate are simply commutable—and the unsymmetrical letters, *a* and *u* (*u* is perhaps sufficiently unsymmetrical), to stand for those copulas with which subject and predicate cannot be interchanged without change of sign. We shall then have

- | | |
|---|---|
| (<i>a</i>) All <i>x</i> is <i>y</i> , | (\bar{a}) Not all <i>x</i> is <i>y</i> , |
| (\bar{u}) None but <i>x</i> is <i>y</i> , | (<i>u</i>) Something besides <i>x</i> is <i>y</i> , |
| (\bar{i}) No <i>x</i> is <i>y</i> , | (<i>i</i>) Some <i>x</i> is <i>y</i> , |
| (<i>o</i>) All but <i>x</i> is <i>y</i> , | (\bar{o}) Not all but <i>x</i> is <i>y</i> . |

The first two copulas in each column are non-symmetrical: *None but x is y* can only be inverted into *None but non-y is non-x*, and *Not all x is y* only into *Not all non-y is non-x*; in the last four propositions all terms are simply commutable.

Language furnishes us with perfectly adequate forms of expression for these eight modes of connection in the compound proposition as well as in the simple proposition.

Thus we have

- | | |
|---|---|
| (<i>a</i>) If it rains it pours, | (\bar{a}) Though it rains it doesnotalwayspour, |
| (\bar{u}) Not unless it rains does it pour, | (<i>u</i>) Besides when it rains it sometimes pours, |
| (\bar{i}) Neverwhenit rains does it pour, | (<i>i</i>) Sometimes when it rains it pours, |
| (<i>o</i>) Unless it rains it pours, | (\bar{o}) Not always except when it rains does it pour. |

PROPOSITION

With the aid of negative terms, and the special terms 'nothing' and 'everything,' any given statement can be made in four different ways with any one copula :

- (a_1) All a is b , (a_3) Nothing is a and \bar{b} ,
 (a_2) All \bar{b} is \bar{a} , (a_4) Everything is either \bar{a} or b ;

and similarly their denials, the particulars.

Or, for the compound proposition,

- (a_1) If a is b , c is d , (a_3) Never is a b , that c is not d ,
 (a_2) If c is not d , a is not b , (a_4) Always either a is not b or c is d .

Now logic should either examine *all* these forms of speech, which are perfectly easy and natural in real life, or it should require everything to be reduced to *one* model form of expression before consenting to study it. It is one of the most remarkable of the curiosities of science that, of the four possible modes of universal statement, a certain two,

- (a) All a is b ,
 (\bar{a}) No a is b ,

should have been regarded as canonical in dealing with terms, but a different two,

- (a_1) If a is b , c is d ,
 (a_4) Either a is b or c is d ,

should alone have been considered to exist in dealing with propositions. Symmetry and harmony and beauty of treatment were attainable only by admitting the complete scheme of possible statements which language has made for us. To admit for the simple and the compound proposition incongruous pairs was strangely ill advised; in this matter unconscious language-construction has shown itself far more intelligent than conscious logic-making. There is no arguing in terms of the so-called hypotheticals, disjunctives, &c., that has not its exact parallel in arguing in simple propositions; and the compound proposition as an element of an argument would not have required any different treatment from that given to terms, had it not been for this forced disjunction between their admitted modes of expression. It is for this reason, among others—to show the parallelism between simple and compound propositions—that the consideration of the full scheme of propositions is essential. (It is proper to regard *if* as a copula, for the actual meaning of If a is b , c is d , is Given that a is b , *it will always follow* that c is d . By an ellipsis of language we are allowed to say all this with the one little word *if*; but logic deals with the real connections of terms and of proposi-

tions, and its first task is to abstract from accidents of language.)

Wundt has proposed a set of symbols to stand for certain of these relations; but the relations which he symbolizes are neither complete nor symmetrically chosen, and the symbols which he makes use of have no connection with each other, nor do they lend themselves to negation. A better set can be constructed by means of variations of the fundamental \leq , so devised as to exhibit plainly the different relations which the copulas bear to each other and to the propositions which they represent :

$a \leq b$ All a is b . $a \leq b$ Not all a is b .	$a \overline{\leq} b$ None but a is b . $a < b$ Some besides a is b .
$a \overline{\vee} b$ No a is b . $a \vee b$ Some a is b .	$a \vee b$ All but a is b . $a \overline{\vee} b$ Not all but a is b .

The negation of any relation is indicated by a line drawn over the corresponding affirmative copula. (This line is then to be regarded as an integral part of the copula to which it is attached.) As thus constructed, these symbols have certain marked coincidences with the relations that they symbolize; they are to this extent of the nature of diagrams, and fitted to hold in mind in a simple form the things that are reasoned about. These coincidences are: (1) Commutative relations are represented by a symmetrical copula; non-commutative relations by a non-symmetrical copula. (2) A copula involving an odd number of lines (i. e. three) is universal; a copula involving an even number of lines (i. e. two or four) is particular. (3) There is a simple rule for the transformation from any one copula to another, which need not be stated here.

The names of these several signs of relation are for universals: the copula of sufficiency, the copula of indispensableness, the copula of incompatibility (or non-concurrence, or exclusion), the copula of exhaustion; and these, together with their negatives (which express particular connections), constitute an exact enumeration of all the simple logical relations in which any two concepts or any two events can stand to each other.

For logic considered as the art and science of drawing conclusions, and of testing the validity of purported conclusions drawn by others, there is no difference between the simple proposition 'Whatever is *a* is *b*' (1) and the compound proposition (i.e. the proposition about propositions) 'Whenever *a* is *b*, it-follows-that *c* is *d*,' or 'That *a* is *b* entails that *c* is *d*' (2). But for that ultimate analysis of the meaning of the proposition which properly comes within the domain of psychology or of epistemology, but which has usually been given over to the logician, there is a distinct difference between them. In the case of (1), the full import is that the universe is such that the assumed substratum for those affections of consciousness which we have summed up under *a* is coincident in time and space (that is, occupies the same point of space at the same instant of time) with the corresponding substratum of the sensation-congeries *b*. This is what is at the bottom of our affirmation that the objects *a* are identical with some of the objects *b*. But when we affirm in (2) identity of occurrence of *a* is *b* with some cases of occurrence of *c* is *d*, the mind makes (one knows not why) a far less complete fusion of *a* is *b* with *c* is *d* than it makes of *a* and *b* in *a* is *b*; thus *a* is *b* may be an occurrence in South Africa, and *c* is *d*, however invariably attendant upon it, may be an occurrence in China; all that is affirmed is sufficiency in the antecedence of the protasis for the occurrence of the apodosis. Thus in 'Whenever the bell rings, the curtain falls,' our whole system of interpretation of conscious experience imposes upon us a far closer fusion in the bell which rings, and in the curtain which falls, than in the compound event which is constituted by their conjoint occurrence. There is more frequently perhaps an interval of time permissible in the compound event than in the compound object, but that makes no difference in the distinction here insisted upon. There is a certain fixed, continuing substratum in the case of *a* which later comes to be *b*; and there fails to be any such bearer of the event *a* is *b*, which is followed by the event *c* is *d*. (C.L.F.)

The forms of words which embody existential judgments ('sea-serpents exist') and impersonal judgments ('it rains') have occasioned much discussion. The former is discussed under JUDGMENT, where the alternative theories are also stated. As to the impersonal, the view indicated under PRE-DICATION is very current and goes very well

with the theory of the existential. It makes the subject of the impersonal the entire sphere of reality (cf. UNIVERSE OF DISCOURSE) within which the observed or indicated phenomena present themselves. Genetically (and linguistically), the impersonal is a very early form. The child says merely 'rain,' assuming the world of fact to which his and others' experience are common. Cf. INDEX (in exact logic).

Literature: see the authors cited; the literature under the topics referred to; the general treatises on LOGIC, and BIBLIOG. C, 1, *b*, and 2, *l*. (J.M.B., C.L.F.)

Prosody [Gr. *προσῳδία*, what accompanies the song]: Ger. *Prosodie*; Fr. *prosodie*; Ital. *prosodia*. The term prosody is used by the Greek grammarians in relation to all the marks, including accents, breathings, quantities, &c., which might be added to the letters in the writing of lines of verse. In modern use it applies solely to the recognition of rhythmical form in verse. This rhythm is dependent on the orderly recurrence of long syllables in quantitative verse, of stressed syllables in accentual verse. (B.I.W.)

Prospection (-ive) and Prospective
Reference: see ORIGIN versus NATURE.

Prostration [Lat. *prostratio*, an overthrowing or subverting]: Ger. *Prostration*, *Er-schöpfung* (exhaustion); Fr. *prostration*; Ital. *prostrazione*. A serious and often sudden loss of strength; likewise a great depression; e.g. the mental and physical prostration sequent to the loss of a friend, to the shock of an accident, &c. Cf. SHOCK.

The term 'nervous prostration' indicates the feebleness and depression characteristic of NEURASTHENIA (q.v.). (J.J.)

Prosyllogism [for deriv. see SYLLOGISM]: Ger. *Prosyllogismus*, *Vorschluss*; Fr. *prosyllogisme*; Ital. *prosillogismo*. A syllogism whose conclusion is a premise of another. See CHAIN SYLLOGISM, and EPISYLLLOGISM. (C.S.P.)

Protagoras. (480 cir.-411 B.C.) Studied under Democritus. Lived and taught in Athens. He was the first who taught philosophy and rhetoric for money, and the first to call himself a Sophist.

Protanopia [Gr. *πρώτος*, first, + *ἄν* + *ᾤπτομαι*, fut. *ᾤψομαι*, I see]: Ger. *Protanopie*; Fr. *protanopie* (suggested); Ital. *protanopia* (suggested). The name proposed by v. Kries for what was formerly called red-blindness.

It is now known (especially by means of the monocular cases) that partial COLOUR-BLINDNESS (q.v.) or dichromasy, with a few exceptional

instances, consists in blue-and-yellow vision, with total lack of both the sensations red and green. Nevertheless, this red-green blindness is of two wholly distinct types (which are such as to have given rise to the earlier belief that in one of these types red-vision only was lacking, and in the other green-vision only): in the first, the so-called red-blindness, the red end of the spectrum is shortened, and the maximum brightness is further towards the green (protanopia), and this is much the more common form of the two; in the second, the so-called green-blindness (deutanopia), neither of these two characters holds. It is important to have names for these two types, the more so as it will aid in banishing the erroneous terms red-blindness and green-blindness. The defect of the mid periphery of the retina is deutanopia.

Literature: v. KRIES, Ueber Farbensysteme, Zeitsch. f. Psychol., xiii (1897). (C.L.F.)

Protasis [Gr. *πρότασις*, stretching forward, what is put beforehand]: Ger. *Vordersatz*; Fr. *protase*; Ital. *protasi*. (1) This is not a term of logic, but in grammar it now means the conditional clause of a conditional sentence.

(2) The Greek word was used by Aristotle in the sense of a premise, especially the major premise, or more generally, for a proposition. The corresponding Latin word would be *praetensio*. (C.S.P.)

Protection (economic) [Lat. *pro* + *tegere*, to cover]: Ger. *Schutz*, *Schutzzoll*; Fr. *protectionnisme*; Ital. *protezione*, *protezionismo*. The restriction of free competition: e.g. protection to child labour. Specifically, a system whereby international competition is restricted by the imposition of a high tariff on the importation of commodities.

Protection as a system was advocated by the Mercantilists and opposed by the Physiocrats. In the early part of this century it was condemned by nearly all economists; but it was advocated again about 1840 by Carey.

Almost all nations impose taxes at the frontier as a means of raising revenue. Up to a certain point an increase in the tax rate means an increase in the receipts; but beyond this maximum, the fall in imports more than balances the increased tax or duty on each article imported. It will thus happen that if a certain revenue, less than the possible maximum, is required, there are *two* tax rates either of which will give it. The man who chooses the lower is a free-trader; the man who chooses the higher is a protectionist. (A.T.H.)

Protective (and Aggressive) Resemblance: Ger. *Schutz(färbung, &c.)*; Fr. *ressemblance protectrice*; Ital. *rassomiglianza protettiva*. A resemblance to some part of the environment which is of no interest to an enemy, for the purpose of defence: hence also called 'procryptic.' Mutatis mutandis, *aggressive resemblance* is concealment from prey for the purpose of attack: hence 'anticryptic.' See MIMICRY, and RESEMBLANCE.

Concealment for attack or defence is exceedingly common in nature, and must have been observed by all naturalists in all times. Erasmus Darwin, in the *Zoonomia* (i. 509, 1794), says: 'The colours of many animals seem adapted to their purposes of concealing themselves, either to avoid danger or to spring on their prey.' During the last forty years the subject has been studied in much detail as a result of the stimulus provided by the theory of natural selection. The pioneer in this labour is A. R. Wallace, who used this subject as an illustration of the working of natural selection in his section of the joint Darwin-Wallace Essay read before the Linnean Society on July 1, 1858. He there suggests that among animals, and especially insects with varied appearances, those 'having colours best adapted to concealment . . . would inevitably survive the longest.' Since that time, in many other works, Wallace has developed the details of the subject, has abundantly illustrated it, and stimulated many other workers to add to our knowledge of it. We can distinguish between *general resemblance* (both protective and aggressive) and *special resemblance*. In the former an animal is invisible in its environment, like medusae in the sea, or desert forms on land, by a general colour harmony, the shape and form not contributing to the concealment. In the latter, the animal resembles some special part of its environment in shape as well as in colour. Familiar examples are yielded by the resemblance of numberless insects to leaves or twigs. In such cases the animal is not invisible, but is liable to be passed by as an object of no interest to its enemy or prey. Many animals are often concealed by resemblance to the same surroundings, and incidentally come to resemble each other. Such likenesses may be called *syncryptic*.

The cryptic colours of many animals are *di-*, *tri-*, or *polymorphic*, varying through different shades or combinations of green and brown, the two chief colours of the vegetable world,

which forms the commonest of all environments. Thus, when the different individuals of a species are in part green and in part brown, an enemy is compelled to search over a wider area and to occupy more time in obtaining food. In many animals the colours change appropriately according as the environment is changed in the course of a life-history. Thus many caterpillars are green upon the food-plant, but become brown at the end of larval life, when they descend to the earth. In other cases there are regular seasonal changes of colour following the seasonal changes of environment, such as the white winter covering of many birds and mammals.

Variable protective resemblance. In the highest and most elaborate form of cryptic resemblance the colours of an individual can at any time be rapidly modified into harmony with any one of the normal environments. This power is possessed by certain reptiles (such as the chameleon), fish, crustaceans, and cephalopods, and it is dependent upon the connection between the nervous system, on the one hand, with the eye, and on the other with the contractile pigmented cells by which the colour is caused. In many sedentary larvae and pupae of Lepidoptera the individuals possess the power of adjusting their colours to the environment once, or sometimes more often. This is probably accomplished by the action of light reflected from surrounding surfaces upon the terminations of the nerves in the skin, and not through the eyes. The central nervous system is probably involved in the adjustment.

Adventitious protective (and aggressive) resemblance: allocryptic resemblance. In these examples an animal is concealed by actually covering itself with some part of its environment. With certain crabs (e.g. *Stenorhynchus*) the covering of *Algae*, &c., is changed when the animal is removed to new surroundings, and it is probable that a similar change of clothing is effected in the natural condition. The coloured food in the alimentary canal of many animals produces a cryptic effect, seen through the transparent body-walls. In certain caterpillars the chlorophyll of the food-plant exists in a modified form (metachlorophyll) in the 'blood' (haemolymph) or 'hypodermic' (epidermic) cells.

This subject is frequently confused with biological MIMICRY (q.v.), in which one animal resembles another which is specially defended and unusually conspicuous.

Literature: generally the same as for MIMICRY (q.v., in biology). (E.B.P.)

Protestantism [Lat. *protestans*, from *pro-testari*, to bear witness]: Ger. *Protestantismus*; Fr. *protestantisme*; Ital. *protestantismo*. The distinctive principles of the Protestant branch of the Christian Church, embracing three fundamental doctrines: (1) the absolute authority of Scriptures as a rule of faith and practice; (2) justification by faith alone; (3) the universal priesthood of believers.

The name Protestant originated with the protest of a body of the Reformed Church against the action of the Diet of Spire, 1526. It soon became an appellation of the whole Reformed movement. In spite of differences of sect and creeds there is substantial agreement among Protestants upon the three distinctive doctrines.

Literature: GIESLER, Eccles. Hist., Lehrb. d. Kirchengeschichte, iii; GUERICKE, Handb. d. Kirchengeschichte (Leipzig, 1866), ii; DORNER, Hist. of Protestant Theol. (Eng. trans., 1871); SCHAFF, The Princ. of Protestantism (1845). (A.T.O.)

Protist [Gr. *πρωτος*, first]: Ger. *Protist*; Fr. *protiste*; Ital. *protista*. An organism consisting only of protoplasm, without any nucleus.

The name was proposed by Haeckel, but the majority of organisms regarded by him as protista are now known to have a nucleus, and it is not certain that any true protista exist; but some authorities claim that they do. From the evolutionary standpoint their existence is probable. See E. Haeckel, *Gen. Morphol.* (1866), and *Hist. of Creation* (Eng. trans., 4th ed., 1892). (C.S.M.)

Proton: see **RUDIMENT**, and **ANLAGE**.

Protoplasm [Gr. *πρωτος*, first, + *πλάσμα*, anything formed or moulded]: Ger. *Protoplasma*; Fr. *protoplasme*; Ital. *protoplasma*. The living substance of the cell, exclusive of the nucleus. See **LIVING MATTER**.

The term was introduced by v. Mohl, and rapidly gained currency. The conception was widely spread by Huxley's celebrated lecture, *The Physical Basis of Life*, which embodied the results of Max Schultze and Kühne. Protoplasm consists of two materials, probably both fluids—the reticulum, and the cell sap or hyaloplasma which fills the meshes of the reticulum. Two theories as to the actual structure are current: (1) according to Flemming, the reticulum consists of threads; (2) according to Bütschli, the reticulum corresponds to the partitions of a foam-like structure.

Literature: E. B. WILSON, *The Cell* (2nd ed.); O. HERTWIG, *Die Zelle*; HENNEGUY, *La Cellule*; DELAGE, *L'Hérédité*. See also under LIVING MATTER. (C.S.M.)

Prototype: see TYPE AND TYPOLOGY (in religious philosophy).

Protozoon [Gr. *πρῶτος*, first, + *ζῷον*, animal]: Ger. *Protozoon*, *einzelliges Tier*; Fr. *protozoaire*; Ital. *protozoo*. An animal constituted by a single cell, or a group of similar cells. The cells may be multinucleated, and the body of the cell may be very considerably differentiated. Cf. AMOEBA, AGAMOGENESIS, and CONJUGATION.

Literature: O. BÜTSCHLI, *Protozoa*, in Bronn's *Thierreich* (1880-2); E. R. LANKESTER, art. *Protozoa*, in *Encyc. Brit.* (9th ed.); A. SEDGWICK, *Textbook of Zool.* (1898); Y. DELAGE and HÉROUARD, *Zool. Concrète*, i (1896); CALKINS, *The Protozoa* (1901). (C.S.M.—E.S.G.)

Proudhon, Pierre Joseph. (1809-65.) Political writer and sociologist. Born and partly educated in a village near Besançon, he was forced, by lack of means, to become a type-setter. In 1837 he won admission to the Paris Academy, and the Academy of Besançon awarded him a three-year stipend of 1,500 francs annually. In 1849 he was committed to three years' imprisonment for attacking the president of the Republic. His literary activity continued unabated, and in 1858 he was again committed for three years. He escaped to Brussels, returning to Paris in 1860, after the general amnesty, where he died.

Prove: see PROOF.

Providence [Lat. *providentia*, from *providere*, to foresee]: Ger. *Vorsehung*; Fr. *providence*; Ital. *provvidenza*. The preordaining and regulative agency of God in the world as distinguished from his creative and sustaining activities.

Providence is an essential feature of the notion of the divine government, and implies not only power, but conscious care and solicitude. It presupposes a divine plan and provision, and involves personal attributes in the deity. In Christian belief a distinction is recognized between God's general providence and the special providence which has regard to the 'fall of a sparrow.' The Stoics recognized providence in a general sense, but denied special providence, which seemed to them to conflict with universal causation. (A.T.O.)

Provisional [Lat. *pro* + *videre*, to see]: Ger. *vorläufig*; Fr. *provisoire*; Ital. *provvisoriale*. Temporarily adopted: applied most

appropriately to any ratio resulting from inductive inquiry; for the value obtained will presumably be increased or diminished on further investigation. (C.S.P.)

Proximate [Lat. past participle of *proximare*, to approach, but it is used to translate *proximus*, next. The word occurs in Glandvill's *Vanity of Dogmatizing*, but in no English treatise on logic before Watts]. In philosophy, synonymous with IMMEDIATE (q.v., also for foreign equivalents), though not so strong.

Proximate cause and effect: an obscure term, like most of the terms of Aristotelianism, which acquired some practical importance owing to the courts holding that a man was responsible for the proximate effects of his actions, not for their remote effects. This ought to determine what should be meant by *proximate cause and effect*; namely, that that which a man ought to have foreseen might result from his action is its *proximate effect*. The idea of making the payment of considerable damages dependent upon a term of Aristotelian logic or metaphysics is most shocking to any student of those subjects, and well illustrates the value of PRAGMATISM (q.v.). Burgersdicius, who is one of the clearest of the Aristotelians, says: '*Proximate cause* is taken in two senses, to wit, *in suo genere* and absolutely. An absolutely proximate cause is one which constitutes its effect, not merely immediately, but by its mere existence; so that, if it exists, its effect (*causatum*, for Burgersdicius is not limiting his remarks to efficient causes) necessarily exists. The proximate cause *in suo genere* is that which immediately constitutes its effect, that is to say, without the intervention of anything else of the same order concurring to produce the effect.' Interpreting this in the light of pragmatism, the man should be held responsible for what might naturally be expected, or feared, as the result of his action; but not for effects depending upon subsequent occurrences which he could not anticipate. Burgersdicius continues: 'One thing may have many causes, proximate *in suo genere*, but only one absolutely proximate. . . . So the proximate material cause of man is his body; the efficient, his father; the formal, his rational soul; the final, *bene esse*.'

Proximate knowledge is direct knowledge of a thing, not knowledge through something else. Better called *direct knowledge*.

Proximate matter is matter in a state in which it is prepared for the reception of a

form. The proximate matter of a syllogism consists in its propositions, as distinct from the remote matter, which consists in the terms.

Proximate object of a directive (as we now say, normative) science is a certain one of the objects of practice, as distinguished from the object of doctrine. In speculative sciences there is only one object, the object of doctrine. In practical sciences there is besides an object of practice, which is that upon which it is designed to produce an effect. In a normative science, such as logic, there are two objects of practice—the *proximate*, which is the operation or action which is regulated, such as reasoning, and the remote, which is that in which that action takes place, such as a mind or a science conducted by many minds.

Proximate witness, testimony. There is hardly any such thing in English law. It is the witness who testifies, not to his own experience, but to facts which he knows by the immediate testimony of others. (C.S.P.)

Proximate (or Second) Cause: see CREATION.

Prudence [Lat. *prudentia*]: Ger. *Klugheit*; Fr. *prudence*; Ital. *prudenza*. Foresight or prevision of the consequences of our actions, and the guidance of conduct by such foresight.

This was regarded by Socrates as the indispensable condition and the absolute guarantee of virtue: 'virtue is knowledge.' It was also emphasized by certain members of the Cyrenaic school, and by the Epicureans. Butler tended to co-ordinate prudence with virtue, making the former the sphere of SELF-LOVE (q. v.), the latter that of CONSCIENCE (q. v.). The earlier hedonists, like Paley and Bentham, affirmed the coincidence in the experience of the individual, either present or future, of prudence and virtue, of egoism and altruism. The evolutionists hold that a tendency towards such a coincidence is to be recognized (cf. Spencer, *Data of Ethics*, chap. xiv); Leslie Stephen, however, regards this effort as no less hopeless than the attempt to square the circle or to discover perpetual motion (*Sci. of Eth.*, chap. x. § 35).

Sidgwick regards prudence as an equally intuitive principle with benevolence and justice: 'I hold with Butler that "reasonable self-love and conscience are the two chief or superior principles in the nature of man," each of which we are under a "manifest obligation" to obey' (*Meth. of Eth.*, pref. to 2nd ed., cf. Bk. III. chap. xiii).

(J.S.)

Pseud- or Pseudo- (in compounds) [Gr. *ψευδος*, a lie]: Ger. *pseudo-*, *falsch*; Fr. *pseudo-*; Ital. *pseudo-*, *spurio*. False, spurious, feigned.

Examples are: PSEUDAESTHESIA (q. v.); pseudochromæsthesia, the imaginary perception of colours in connection with sounds (see SYNAESTHESIA); pseudamnesia, an illusion or mistake of memory in which a person seems to remember that which he never experienced; pseudopsia, false vision, hallucination; instances under MIMICRY (q. v., in biology). (J.J.)

Pseudaesthesia [Gr. *ψευδής*, false, + *αἴσθησις*, sensation]: Ger. *Pseudästhesie*; Fr. *pseudes-thésie*; Ital. *pseudestesia*. Illusion of sensation.

Applied especially to the cases in which irritation of the nerve at the point of amputation of a limb (e.g. stump of the arm) produces the sensation normal to the end-organ of the limb which has been removed (e.g. felt as if in the hand). (J.M.B.)

Psyche [Gr. *ψυχή*, breath, life, soul, from *ψύχειν*, to blow]: Ger. *Psyche*; Fr. *psyché*; Ital. *psiche*. (1) The Greeks conceived man as having a 'double,' a second, shadowy counterpart or likeness of the bodily existence, the *ψυχή*. This was not contrasted with the body in the way in which the psychical is now contrasted with the corporeal. It was rather conceived as a 'breath,' a thinner more subtle body, which formed the animating principle in life, left the body at death through the mouth or through a wound, and after separation from the body had an existence too unsubstantial to be called life.

Such was the Homeric conception. A more definite existence and influence were implied in the cultus of the souls of the dead which was maintained by families; and the worship of the gods of the underworld, especially the cultus of Demeter in the Eleusinian mysteries, directed men's attention towards the 'other world.'

(2) In the worship of Dionysus, which was introduced from Thrace and subsequently modified by contact with Apollo-worship, the 'psyche' becomes the primary superior half of man's nature. Exiled from some previous dwelling-place into the body, its life in this bodily state is a penalty rather than a privilege. It escapes temporarily in ecstasy (*ἔκστασις*) or frenzy induced by the sacred music or by fasting, and at such times becomes united to the god and inspired (*ἐνθεός*) by him. The true home of the psyche is not in the lower world, but beyond the stars.

Neither in this phase nor in the preceding is the psyche distinctly mental or spiritual, but in this phase its value is greatly enhanced, and the dualistic separation of later philosophy is anticipated.

(3) In the early philosophy of the Milesians and Atomists attention was so occupied with the cosmos that the psyche was conceived almost entirely as of like substance or *phûsis* with the world at large. Its character as a moving, animating principle led to its identification with the moving principle or element of the cosmos when such an element was distinguished. So Anaximenes regarded the psyche as air, Heraclitus and Parmenides as fire, Leucippus as fiery mobile atoms, Diogenes as the warm air or exhalation from the blood, Anaxagoras as participating in the *Nous* (q. v.).

(4) The Pythagoreans, on the other hand, centred attention much more upon the psyche, and shared the views named under (2) above. The world of the psyche was regarded as higher and purer than the world of the body. Philolaus further sought to affiliate the psychology to the cosmology by conceiving the psyche as a 'harmony' of the bodily element, but it is difficult to reconcile this with the great emphasis placed upon the transmigration, and consequently upon the persistence and permanence, of the psyche.

(5) It was Plato who gave full philosophical valuation and expression of the religious and ethical views of (2). The soul (psyche) is in his view self-moving, immortal, akin to the gods, and if not completely identical with the ideas or *νοῖα* which form the world of true being, as contrasted with this visible world of generation and corruption, it is yet participant in the idea of life. It has seen the world of absolute being, truth, beauty, and goodness, and under the stimulus of beautiful forms recalls the visions of its pre-existent state. Life in the body is in truth an inferior existence, and the philosopher longs to fly away.

The psyche is also given a semi-psychological analysis, with a controlling or directing and a motor element. This latter is subdivided on an ethical principle into an appetitive and a 'spirited' (*θυμοειδές*) part, corresponding to what we should call the bodily appetites on the one hand and the finer, nobler instincts on the other.

(6) Aristotle, in his treatise *Concerning the Psyche*, approaches the problem once more from the biological and metaphysical stand-

points. The psyche is the organizing form or ENTELECHY (q. v.) which gives unity to the bodily elements. It is the active principle. Three grades of such organizing activity are distinguished as the vegetative, the animal, and the rational soul, and these are not separable from the body. In the rational soul one part, the active *Nous* (q. v.), like the psyche of (2), (4), and (5), comes 'from without,' and outlasts the bodily existence; but the psyche is not immortal, and some later members of the school denied the separate existence of the nous.

(7) Interest in the Stoic school centred not in the psyche, but in the *PNEUMA* (q. v.). This served at first as a medium between soul and body, at once material and psychical. It thus enabled the Stoic to state the whole life in corporeal terms, and yet to provide for the animating and mental activities. This naturalistic tendency was also conspicuous in the physicians of the time, who related the psyche more closely to the bodily functions, and, as against the view of Aristotle and the Stoics, located the psyche within the brain, where, indeed, Plato had located the thinking function, while assigning the *θυμός* or nobler emotions to the heart, and the bodily appetites to the liver.

(8) In the Jewish-Alexandrine, Pauline, and Neo-Platonist psychology, the psyche is in general treated as the animating principle in close relation to the body, whereas the pneuma (as representing the divine breath breathed into man), the nous, and the Logos (q. v.) stand for higher entities. They are the more universal, the more divine, the ethically purer. By this more explicit separation of the intellectual and ethical activities from the physiological the conception of the mental or psychical (in the modern sense) was at length reached.

Psychiatry [Gr. *ψυχή*, soul, + *ιατρεία*, a healing]: Ger. *Psychiatrie*; Fr. *psychiatrie*; Ital. *psichiatria*. The study and treatment of mental diseases. Psychiatrist is a synonym of alienist, and means a specialist in mental

diseases. See ABNORMAL PSYCHOLOGY, PSYCHOPATHOLOGY, PSYCHOLOGICAL MEDICINE, and PSYCHOSIS. (J.J.)

Psychic or Mental (1) and (2) **Psychological**: Ger. (1) *psychisch* und (2) *psychologisch*; Fr. (1) *psychique ou mental*, et (2) *psychologique*; Ital. (1) *psichico* e (2) *psicologico*. It is recommended that these terms mark a distinction between conscious process as it is apprehended (1) by itself and (2) by another.

For instances of its application, see **MEDIACY** AND **IMMEDIACY**, and **ANALYSIS** (a case in which the distinction is already realized in the German terminology). (J.M.B., G.F.S.)

Psychic (or Mental) Blindness, Deafness, Dumbness, and Paralysis: see **BLINDNESS** (psychic), **DEAFNESS** (psychic), **DUMBNESS** (psychic), and **PARALYSIS**.

Psychic Effect of Drugs: Ger. *psychische Wirkungen der Arzneimittel*; Fr. *effets psychiques des poisons*; Ital. *azione dei medicamenti sulle facoltà mentali*.

The fact that mental processes may be affected by the action of drugs is a common possession of mankind in all stages of civilization. Among primitive peoples the preparation of drugs that produce some form of intoxication is a widespread practice, and often acquires a ceremonial significance. The Orient has contributed several forms of psychic poisons, and recent chemical and pharmaceutical research has added others. The use of such drugs by the physician is insignificant compared to the extent of their abuse for the purpose of obtaining some form of mental indulgence. Alcohol and opium are the most important of such substances. The profound alteration of physical and mental vigour produced by over-indulgence of these poisons has made the regulation of their use a serious problem of modern society, and has aroused the ardent interest of all who have a concern for the moral welfare of mankind.

Information in regard to the effect of drugs upon psychic functions is derived from casual observation, from the recorded experiences of physicians in administering them for specific ends, and from experiments designed to determine by the application of psychological tests the precise influence of specific doses of given drugs upon the sensory, motor, and intellectual groups of functions. The descriptions of altered mental conditions and of the subjective experiences of persons under the influence of mental poisons also forms an instructive source of information.

In the present imperfect knowledge of the physiological substrata of specific mental processes, it is impossible to classify the action of drugs according to their effects upon the chemical constituents and functional activities of the several nervous centres. The most extensive investigations consider the effect upon the senses, upon movements, upon the general acquisitional powers, upon memory and association, upon co-ordination of delicate actions, upon logical alertness, upon emotional tone, upon the play of the imagination, upon general intellectual status. But it is not possible to arrange the available material according to any strict classification; one must be content with general descriptions which illustrate or emphasize some limited groups of typical effects. An important difficulty inherent in the study of this topic is the great fluctuation of individual susceptibility to different toxic substances, the dependence of the effect upon the dose, upon the manner of assimilating it, upon climate, race, social condition, general bodily tone, state of the digestion, &c. The cause of individual susceptibility and immunity is here, as in other connections, an unsolved problem.

The list of substances which have a more or less distinctly recognized effect upon mental processes includes alcohol, opium, hashish, morphine, chloral, chloroform, ether, cocaine, mescal, kola, tea, coffee, tobacco, the various hypnotics such as sulphonal, paraldehyde, the bromides, nitrate of amyl, and many other less familiar drugs and preparations (maté, kawa, lecheguana, anamirte, guarana, betel, &c.). It will be profitable to confine attention to the better known of these, and to consider first the results of specific experiments on normal individuals.

Kraepelin, and others through his instigation, measured the times of reaction to simple stimuli, the time required for simple sensory distinctions, and for indicating such distinctions by appropriate movements, the accuracy of estimating brief intervals of time, the quickness and nature of associations, the speed and accuracy of adding, the power of committing to memory, the muscular energy as indicated by the dynamometer, &c.; first under normal conditions, and then at intervals under the influence of given doses of alcohol, ether, chloroform, tea, morphine, bromide, &c. Of their conclusions the following are capable of brief statement. Alcohol in small doses (15 grammes) at first (for about 45 minutes) quickens and then slackens motor processes,

and from the start retards sensory and intellectual powers; in larger doses the quickening period of motor processes is shortened, and the retardation of all processes is extended over a longer period, but is not greater in degree. The action of ether and chloroform is quite similar, and consists in an acute quickening of motor powers, and retardation of sensory and intellectual powers; in light doses both effects disappear after about fifteen minutes; in stronger doses they may last half an hour, and the motor acceleration diminishes or disappears. Nitrate of amyl presents similar results. Chloral (1 gramme) shows a gradually increasing retardation or blunting of all the mental processes tested, which reaches a maximum after an hour or so, and is still perceptible after two hours. Morphine (0.1 gramme) presents a marked motor retardation, reaching a maximum in $1\frac{1}{4}$ hours, together with an equally marked quickening of sensory and intellectual processes, which reaches a maximum in three-quarters of an hour. Trional presents a retardation in such processes as adding and committing numbers to memory, lengthens the time of adaptive or choice reactions, increases errors and omissions in reading letters and words passing across the field of vision, and slackens the speed of writing, but has no effect upon the associative processes, or the rapidity of repeating a given series of words or numbers, or upon the ergographic efficiency; i. e. trional affects the powers of acquisition, disposes them to error, and impedes the execution of co-ordinated movements. Bromide of sodium does not influence the automatic associations involved in adding, nor the innervation and execution of movements, but increases the difficulty of learning series of numbers, while lessening that of learning nonsense syllables; if, however, the learning goes on under conditions of distraction, the action of bromide is to facilitate such acquisition, i. e. to lessen the effect of the distraction, thus agreeing with the clinical use of bromide to dissipate subjectively distressing feelings of anxiety. The psychic effect of tea depends upon the caffeine which it contains, and this brings about an increase in muscular efficiency, traceable to its direct effect upon the muscular tissue (although in Kraepelin's earlier results a diminution of motor power appeared), and also a facilitation of familiar associative processes, i. e. a gradual and distinct sensory and intellectual stimulation. The effect of alcohol on the practical efficiency of compositors' daily

work has also been strikingly demonstrated. Fragmentary as such conclusions may be, they serve to indicate the trend of current investigation.

Clinical observation contributes information regarding the mental effects of frequent and habitual indulgence in drugs and of overdoses. The profound alterations due to alcoholic excess are described under ALCOHOLISM (q. v.). Like alcohol, opium, morphine, and chloral develop a craving for the poison, and thus produce a habit and the symptoms of a chronic poisoning. These present a great variety of abnormal mental phenomena, which, as in alcohol or opium, constitute the characteristic intoxication. Certain drugs produce no true intoxication, but only special and localized symptoms, while still others induce a more or less profound sleep and insensibility. Thus curare and Calabar bean (*Physostigma venenosum*), the 'ordeal-bean' of West Africa, produce motor paralysis through their action upon the spinal cord or directly upon the muscles, but leave sensibility and mental action unaffected; quinine produces a ringing in the ears, and santonine induces a yellowish tinge in the visual field; strychnine increases reflex excitability, bromides allay it; cocaine produces a local anaesthesia; chloroform, ether, nitrous oxide gas produce sleep and general anaesthesia, while many preparations such as sulphonal and trional are administered as hypnotics. Excessive doses of almost any of these substances are truly poisonous, and may lead to fatal results. Referring to the medical treatises for the specific action of the large list of toxic substances, attention may be directed to the more intellectual changes which certain of these drugs induce.

Dreams, or dream-like play of the imagination, delirium and raving, illusions and hallucinations, changes of the personality may be induced by opium, hashish, mescal, &c. De Quincy's account, with due allowance for its literary and personal flavour, illustrates the variety of intellectual changes which opium indulgence may bring on; the formulation of the imagination, the increased vividness of recollection, the undermining of will energy, the stimulation of associative processes, the exaggeration of space and time relations, and the like. In an account of the action of hashish (*Cannabis indica*), by Clarke, the experience of a student with his first dose of the drug is recorded; he was shortly affected with acute megalomania; his personal attractiveness, his physical powers, the magnificence

of his possessions and surroundings were greatly impressed upon him, and led to a forcible expression of his superiority to the rest of mankind. Upon this ensued a splitting of the personality, in which consciousness No. 1 was a notable physician who proceeded to carry out remedial measures upon the person of consciousness No. 2. After a sleep the normal condition was re-established, but a vivid recollection of the extravagances of the hashish vision remained. In general it is stated that the hashish visions are magnificent and commanding, and are thus opposed to those of alcohol, which are often minute and terrifying and turbulent. The intoxication of mescal has been described as 'chiefly a saturnalia of the specific senses, and, above all, an orgy of vision. It reveals an optical fairyland, where all the senses now and again join the play, but the mind itself remains a self-possessed spectator.' Dazzling visions of marvellous colour-effects streaming with indescribable brilliancy and play of colour from the most common objects are described, combined with no other disturbance than a sense of weakness and a difficulty in respiration. Depression and excitement, volubility and incoherency, wild gesticulation, reflective ecstasy, an exuberant sentimentality, a voluptuous euphonia, an exaggerated sense of self-satisfaction and ambition, a distortion of orientation both literal and intellectual, and indeed almost any of the insane disturbances of psychic states and of emotional fluctuation may appear as the result of drug stimulation. The nature of such effects cannot be explained nor anticipated, owing largely to the important individual reaction to toxic stimulation and to the inevitably imperfect correlation of mental symptoms with physiological substrata in individual cases.

The study of the psychic effect of drugs yields one of the most significant forms of evidence of the interrelation between mental and bodily conditions; it contributes equally to the conception of abnormal mental activities; it offers a means of psychological analysis by varying certain factors of a psychological complex, and leaving the others unaffected. When the specific action of drugs on nervous elements shall have been ascertained, it promises to enrich the working conception of brain functions, while from a practical point of view it offers the physician the means of altering the mental condition and of allaying pain, but at the same time presents the problem of dealing with the drug

habits so readily established in susceptible individuals.

Med.; also the works given under DELIRIUM. The classical psychological description is in DE QUINCY, Confessions of an Opium Eater. (J.J.)

Psychical Research: used also in the other languages. As a technical expression, psychical research owes its origin to the foundation of the English 'Society for Psychical Research' in 1882. The object of the society was, and is, to make an organized and systematic attempt to investigate various sorts of debatable phenomena which are *prima facie* inexplicable on any generally recognized hypothesis, and which may be regarded as having some bearing on the question of the independent existence and activity of mind apart from body. (Hereafter in this article the society is called the 'S. P. R.')

Some of the principal departments of investigation undertaken by the society are:—

(1) An examination of the nature and extent of any influence which may be exerted by one mind upon another, otherwise than through the recognized sensory channels (TELEPATHY, q. v.).

(2) The study of HYPNOSIS (q. v.) and hypnotism; and an inquiry into the alleged phenomena of clairvoyance. Under this head we may include various forms of automatism, which have engaged the attention of the society, especially crystal vision, automatic writing, and the finding of water by the divining rod.

(3) A careful investigation of any reports, resting on testimony sufficiently strong and not too remote, of apparitions coinciding with some external event—as, for instance, a death—or giving information previously unknown to the percipient (veridical hallucinations), or being seen by two or more persons simultaneously (collective hallucinations), or at different times independently.

(4) An inquiry into various alleged phenomena apparently inexplicable by known laws

of nature, and commonly referred by spiritualists (cf. SPIRITISM) to the agency of extra-human intelligences.

(5) An inquiry into the evidence for premonitions and previsions, for which see *Proceedings S. P. R.*, v, xi.

The aim of the society is to approach these various problems without prejudice or prepossession of any kind, and in the same spirit of exact and unimpassioned inquiry which has enabled science to solve so many problems, once not less obscure nor less hotly debated. The founders of the society have always fully recognized the exceptional difficulties which surround this branch of research; but they nevertheless believe that by patient and systematic effort some results of permanent value may be attained. A similar society was founded in the United States of America in 1884, and incorporated in 1890 with the British society. Societies with somewhat similar aims have been established in Germany and elsewhere, and much assistance has been received from individual workers in various countries. Psychical research has taken an important place among questions discussed at International Psychological Congresses.

The different branches of inquiry described under the four heads above are not of course independent of one another; and, in particular, facts elicited by investigations under heads (2), (3), and (4) form an important part of the evidence bearing upon the subject dealt with under the first head—the influence of mind on mind otherwise than through the recognized sensory channels, or telepathy. But closely connected though many of the subjects considered are, they cover a very wide range of phenomena; and the effort to treat the evidence offered for them in a scientific manner has necessarily led to the adoption of very various methods in different cases.

(1) As regards the first head, the experimental method assumes the most important place; and in applying it, the important thing in the first instance was to establish the fact of telepathy. But the establishment of the fact, that is, the negation of the ordinary channels of communication between mind and mind, is clearly a matter of extreme difficulty, if not impossibility, in any one case—not only on account of the danger of unobserved sensory indications, but on account of the very imperfectly known limits of the human faculties acting through the ordinary channels. The difficulty is increased by the fact that no means have yet been discovered for producing

the phenomena of telepathy at will. If, in addition, the honesty of all concerned cannot be assumed—and of course, strictly speaking, it never can be—the problem becomes still harder. As regards probity, indeed, the only course seems to be to encourage as many varied experiments by various persons as possible, so that the widespread attribution of intentional deception which would be necessary to explain them all may ultimately become absurd.

The necessity of guarding against unconscious indications in experiments in thought transference or telepathy has led to a good deal of attention being paid to the possibilities of such means of communication as ‘muscle reading’ and unconscious whispering. Muscle reading, or the interpretation of slight movements and gestures, is the explanation of those public performances in so-called thought reading in which there is contact between the person ‘willing’ and the performer; and similar interpretations, often doubtless unconscious, are the most probable explanation of the ‘willing game’ in private. The proved possibilities of muscle reading render worthless as evidence of telepathy almost all thought-transference experiments in which there is contact between the ‘agent,’ or person trying to transfer his thought, and the ‘percipient,’ or person trying to read it. Any whispering—even unconscious—by the agent of the idea to be transferred is more easily guarded against.

Notwithstanding the difficulties, a considerable mass of evidence for telepathy has been accumulated by different observers, and it is in this subject that the largest amount of important work has been done by the society. For a discussion of the evidence for telepathy and thought transference see TELEPATHY.

(2) Under the second head—hypnotism or mesmerism, &c.—interesting work was done by the late Edmund Gurney on certain psychological aspects of hypnotism, and particularly on the relation between more or less disconnected states of consciousness in the same individual (see *Proceedings S. P. R.*, ii, iii, iv, and v; see also the work of J. Milne Bramwell, published in *Proceedings S. P. R.*, xii). Much attention has, of course, been given of late years, in France and elsewhere, to the psychological aspect of hypnotism without reference to the problems of psychical research. The light thrown by hypnotism on the working of the mind is, however, of great importance in relation to psychical research, because of the opportunities hypnotism affords

for the experimental investigation of sensory hallucinations, automatic writing, and other forms of subconscious activities. The hypnotic state also seems favourable to the telepathic process, and some of the most successful experiments in telepathy have been conducted with hypnotized percipients.

Clairvoyance, which we have included under this head, is a term which has been used in several meanings. The two most important are: (1) the perception of things passing at a distance, and known to some living person, but not to any one in direct relation with the percipient; this may be regarded as a form of telepathy. (2) The perception of things unknown to any living person, e.g. a number taken at random from a bag and unseen by any one. For clairvoyance in this second sense there is not at present much evidence (see experiments by Richet, *Proceedings S. P. R.*, v, vi); nor have the S. P. R. obtained much experimental evidence for the first kind of clairvoyance (see, however, some experiments by A. Backman, *ibid.*, vii). For a collection of spontaneous cases see papers by Mrs. H. Sidgwick, *ibid.*

Crystal gazing, which is a method of inducing visual hallucinations more or less at will—in most cases with but a slight disturbance, if any, of the normal consciousness—is a subject to which the S. P. R. has given a good deal of attention. Interesting observations and experiments on it will be found in the *Proceedings S. P. R.*, v, viii, and xii. Curious cases occur of the recrudescence through crystal visions of forgotten impressions, and it seems in some cases to be a way of bringing telepathically received impressions to the surface. Some persons who can see visions in crystals can similarly induce hallucination of voices by holding a shell to the ear.

The use of the divining rod for finding water is apparently an instance of automatic and unconscious muscular action resulting from an impression subconsciously received. Whence the impression comes, whether directly through the senses, or by subconscious inference, or by means of some unrecognized sense, is obscure. But there is strong evidence that underground water actually is found by 'dowsers,' where experts have failed to discover it by other means. The evidence has been exhaustively dealt with by W. F. Barrett in the *Proceedings S. P. R.*, xii and xv.

(3) Under the third head enumerated above, a large amount of investigation has been

carried out by the S. P. R. into the subject of what are popularly called ghosts. Spontaneous visual and auditory hallucinations—the apparent seeing and hearing of things not forming part of the physical world—are not infrequently experienced by healthy persons; but in most cases there is, of course, no reason to attribute to these apparitions or voices any more importance than to the ordinary deliberately sought crystal visions. In a certain proportion of cases, however, the hallucination is 'veridical' or truth-telling. It coincides, that is, with some external event unknown to the percipient in a way that suggests a causal connection between the two. The most familiar instance is the apparition of a person at the time of his death at a distance. In such cases, after sufficiently establishing the fact of the coincidence, the question we have to ask is whether the coincidences occur more frequently than they would do by the operation of chance alone. The method of investigation becomes therefore statistical. A first attempt to deal with the evidence statistically was made by Gurney in *Phantasms of the Living*—a work in which the evidence up to that time collected for coincidental hallucinations was very fully treated—and for this purpose he made a considerable collection of apparitions coincidental and casual, in order to compare the two classes with each other. It was felt, however, even at the time, that a larger collection was required, and a committee, under the presidency of Henry Sidgwick, appointed at the Paris International Congress of Experimental Psychology in 1889, collected, with the help of friends, answers from 17,000 persons to the inquiry whether they had ever had a sensory hallucination. About 10 per cent. of these answered in the affirmative, and their experiences were carefully inquired into and analysed. The results (published in *Proceedings S. P. R.*, x, as the 'Report on the Census of Hallucinations'), besides bringing out much interesting matter of other kinds about the spontaneous hallucinations of healthy persons, showed among these 17,000 persons the alleged occurrence of 381 apparitions of persons believed by the percipients at the time to be alive, of which 80 were reported to have occurred within 12 hours of the death of the person seen. Even after making very large allowance for errors of various sorts, described fully in the report, the proportion is far beyond the 1 in 19,000 which, as shown in the report, could be accounted for as due to chance.

Apparitions coinciding with a death lend themselves especially to statistical methods of investigation, because the probability of their occurrence by chance can be exactly calculated. It will be observed, however, that statistical considerations play a large part in most departments of psychical research, even where the investigation is experimental. In experiments in thought transference, for instance, the results are as yet so little under control that the percipient as a rule has more often a wrong than a right impression of the idea the agent endeavours to transfer, so that our judgment as to the value of the results depends partly on an estimate of the number of successes that would probably be attained by chance.

Under the head of 'ghosts' the experimental method has been applied in two departments. First, a few persons have succeeded in telepathically causing a percipient at a distance to see an apparition of themselves or others. There is much need of further experiment of this very important kind. Particulars of some will be found in *Phantasms of the Living*, in *Apparitions and Thought Transference* by F. Podmore, and in the 'Report on the Census of Hallucinations' already referred to. But see also *Proceedings S. P. R.*, xiv. 114.

The experimental method has also been applied in the case of houses alleged to be haunted. It is obvious that apparitions seen in a house by one person, or even by different persons at different times, but presenting no marked characteristics unknown to the percipients, do not *prima facie* differ from ordinary subjective hallucinations. If, however, *B* saw in a house an apparition markedly resembling one seen by *A*, but of which *B* had not previously heard the particulars, there might be some ground for assuming a local cause for that apparition. Various attempts have been made under the auspices of the S. P. R. to discover similar apparitions seen independently in so-called haunted houses—the previous stories being kept secret from the would-be percipients—but so far these experiments have been almost without result.

Under head (4)—'spiritualistic phenomena'—widely differing phenomena are included. We have first the physical phenomena of spiritualistic séances—the alleged movement of objects and other mechanical effects, produced in the presence of certain persons called 'mediums' or 'sensitives,' without ordinary physical agency. The S. P. R. has published investiga-

tions, conducted before its own foundation by persons of repute, supporting the reality of such phenomena. It has also done useful work in exposing fraud and in demonstrating possibilities of mal-observation. A paper on this latter point by Hodgson and the late S. J. Davey (in *Proceedings S. P. R.*, iv) will be found interesting. But there has of late been little opportunity of investigating these phenomena, from a positive point of view; with 'sensitives' against whom there is no well-founded suspicion of fraud.

With these physical phenomena may be classed the alleged marvels which occurred in connection with Madame Blavatsky and the Theosophical Society, for although post-mortem agency was not claimed for them, they were largely similar in character to the phenomena of the séance room. They were carefully inquired into by the S. P. R., on whose behalf Hodgson visited India in 1884-5. His investigations, of which the report was published in *Proceedings S. P. R.*, iii, aided by the confession of some of Madame Blavatsky's accomplices, clearly showed that the marvels were due to trickery.

But what have proved the most fruitful subjects of investigation under this head are the communications received from 'sensitives' in the trance state, and usually claiming to come from deceased persons. Like automatic writing, such trance utterances, even when there is no conscious fraud connected with them, do not as a rule exhibit knowledge or intelligence beyond the sensitive's own. But there are exceptional cases in which the knowledge shown by a person speaking or writing in trance can hardly be supposed to have been acquired by normal means, and where we seem to require at least the hypothesis of telepathy, and sometimes telepathy between the sensitive and persons at a distance in no direct connection with him or her. Some of the communications are found by some writers difficult to explain without assuming post-mortem agency, and some investigators have convinced themselves of the reality of this. The most important publications by the S. P. R. of late years have been detailed accounts of prolonged investigations by Hodgson, W. James, Oliver Lodge, Newbold, Leaf, Myers, and others, with such a trance-speaking sensitive—a Mrs. Piper. Other inquiries, both with this lady and another, are in progress, and it is in this direction that most advance seems at present likely to be made in psychical research.

Literature: Proc. Soc. Psych. Res., i-xv (1882-1901; a 'General Index' of all the vols. is about to be published); Proc. Amer. Soc. Psych. Res., Pts. I-IV (1884-9); EDMUND GURNEY, FREDERIC W. H. MYERS, and FRANK PODMORE, *Phantasms of the Living* (1886); FRANK PODMORE, *Apparitions and Thought Transference* (1894), and *Studies in Psych. Res.* (1897); R. OSGOOD MASON, *Telepathy and the Subliminal Self* (1897); G. B. ERMACORA, *La Telepatia* (1898); ANDREW LANG, *The Making of Religion* (1898); TH. FLOURNOY, *Des Indes à la planète Mars: Étude sur un cas de Somnambulisme avec Glossolalie* (1900); Dr. A. LEHMANN, *Aberglaube u. Zauberei* (Ger. trans., 1898); F. W. H. MYERS, *Human Personality and its Survival of Bodily Death* (1902). See also under TELEPATHY. (E.M.S.)

Psycho- [Gr. ψυχή, the mind or soul]: Ger. *Psycho-*; Fr. *psycho-*; Ital. *psico-*. Used in combination to indicate what is in some degree psychic or mental. (J.J.)

Psychodynamics: theory of mental process considered as undergoing change and development.

Psychoneurosis: PSYCHOSIS (q. v.), with NEUROSIS (q. v.).

Psychoparesis: PARESIS (q. v.) having psychic cause or symptoms.

Psychophysiology: PHYSIOLOGICAL PSYCHOLOGY (q. v.), or PSYCHOPHYSICS (q. v.). A general and inexact term.

Psychostatics: theory of conscious states considered as elements or contents fit for composition or analysis.

See also the topics immediately following; and cf. PSYCHIC AND PSYCHOLOGICAL. (J.M.B.)

Psychodynamics: see PSYCHO-

Psychogenesis [Gr. ψυχή, mind, + γένεσις, birth]: Ger. *Psychogenesis*; Fr. *psychogénèse*; Ital. *psicogenesi*. The origin and development of mind, and the science of it.

The term implies some form of development under natural laws, and so excludes the theories which deny this; as, for example, the 'special creation theory'—in so far as it denies real development or evolution—is not called psychogenetic. The problem of psychogenesis is twofold: (1) that of the beginnings and development of the individual mind; and (2) that of the beginnings and evolution of mind in the series of animal forms and in the history of man. See EVOLUTION, DEVELOPMENT, and (mental and social), with the literature cited there. (J.M.B.)

Psychogenic [Gr. ψυχή, soul, + γένος, birth]:

Ger. *psychogenetisch*; Fr. *psychogénique*; Ital. *psicogenico*. Of mental origin; affected by mental influences. Cf. GENESIC.

The paralyses and anaesthesias of hysteria, the inhibitions and hyperaesthesias of hypnotic states, the pains and fears of neurasthenia, the ameliorations following appeals to faith or prayer are instances of psychogenic action. The terms subjective, imaginary, &c., are in one way or another inexact or misleading. Psychogenic is a technical term for the mental dependence proper to such symptoms. Psychogenic symptoms have in part an objective basis, but they are particularly amenable to mental influence. (J.J.)

Psychological Automatism: see AUTOMATISM (psychic).

Psychologism [Gr. ψυχή, soul, + λόγος, science]: Ger. *Psychologismus*; Fr. *psychologisme*; Ital. *psicologismo*. (1) The theory that 'the soul can think without any real object, or with an object furnished by itself . . . that man is both intelligent and intelligible in himself, suffices for his own intelligence, without any dependence on any objective reality' (Brownson, *Works*, ii. 482). Cf. ONTOLOGISM.

(2) The doctrine of Fries and Beneke (see the histories of Falckenberg and Windelband), which translates the critical examination of reason (of Kant) into terms of empirical psychology. (J.D.)

Psychologist's Fallacy: Ger. *Psychologenfehler*; Fr. *sophisme des psychologues*; Ital. *sofisma psicologico*. The fallacy, to which the psychologist is peculiarly liable, of reading into the mind he is examining what is true of his own; especially of reading into lower minds what is true of higher. 'The great snare of the psychologist is the confusion of his own standpoint with that of the mental fact about which he is making his report. I shall hereafter call this the "psychologist's fallacy" par excellence' (James, *Princ. of Psychol.*, i. 196; see also ii, Index, 'Fallacy'). (J.M.B.)

Psychology [Gr. ψυχή, the soul, + λόγος, discourse]: Ger. *Psychologie*; Fr. *psychologie*; Ital. *psicologia*. The science which treats of actual psychical processes, their objects as such, and the conditions of their occurrence.

This definition requires some explanation. In the first place, we have to ask: What is a psychical process?—and in the second: What are the conditions of its occurrence of which psychology must take account?

(1) A psychical process is a conscious

process; and an actual psychical process is a process as it takes place in the life-history of some individual consciousness at a particular time and in connection with some particular bodily organism. It is especially to be noted that psychology does not deal with abstractions as its distinctive subject-matter. Logic, when it treats of judgment, has in view only the abstract form of connection between subject and predicate, not the concrete process of judging as it takes place in an individual mind. But it is just this concrete process with which psychology is concerned.

Similarly, thought in the abstract, as the general relation between cognitive consciousness and what is cognized, does not belong to the distinctive subject-matter of psychology. What the psychologist is distinctively concerned with is the concrete operation of thinking.

Such terms as attending, questioning, doubting, hoping, fearing, desiring, being interested, &c., stand for psychical processes which involve the distinction and relation of subject and object. We cannot attend without attending to something, question without questioning something, hope without hoping something, &c. Now, the primary and distinctive interest of psychology is in the subjective side of this relation—in the process of attending, not in what is attended to, in the process of desiring, not in what is desired. The distinction between the subjective process and its object is in part of a formal nature, consisting of a difference in time-relation. The time-relations of the presented object itself are different from those of its appearance to consciousness. When we think of the future or past as such, our thinking is not future nor past, but present. When we observe a building, its parts and features are successively presented; but they are presented not as being successive, but as coexisting. When we attend to the order of presentation, we are attending to psychical process as such. When we are attending to the presented order, we are attending to the object—in this case to the building. But beside this formal difference of time-relations, the subjective process has also positive qualities of its own, which belong to nothing else. The questioning attitude, for instance, is no qualification of the object: it is a peculiar way in which we are conscious of the object. The object itself is thought of as determinate: it is only we who are undetermined in regard to it. Plainly, desiring, longing, and voluntary choice are subjective

processes having their own positive nature as distinct from the nature of their object.

It has been said that the distinctive interest of psychology is in the subjective side of the subject-object relation. But this does not mean that the psychologist disregards the objective side. This is impossible. It is impossible to think of attention without reference to something attended to, or of a specific case of attention without reference to something specific which is attended to.

Apart from a certain reservation to be noticed later on, the essential point is that psychology only considers objects in their relation to subjective process. It is not concerned with their being and nature, so far as this being and nature is independent of their being actually cognized, attended to, willed, desired, &c., by an individual consciousness. The individual consciousness which knows, attends, wills, desires, &c., is directly interested in the independent being and nature of the objects themselves, and not in the fact that they are presented to it or in the features which belong to them only in virtue of their presentation; but it is just the fact of presentation and all that is connected with it which constitutes the special field of psychological inquiry. The object of cognition interests the psychologist only in so far as somebody cognizes it, or comes to cognize it, or attempts to cognize it, or forgets it, or remembers it, or fails to remember it, and so on. The object of volition interests the psychologist only in so far as somebody wills it, or comes to will it, or ceases to will it, &c. His interest in the object of cognition or will is inseparably connected with and conditioned by his interest in the processes of knowing and willing.

Thus he has no direct concern with the constitution and laws of the physical world. But it is his special business to exhibit the process through which such a world comes to be presented to the individual consciousness. He has no direct concern with spatial relations as the geometer has. But it is part of his task to show how the young child gradually becomes aware of such relations. He is not called upon to define the real distinction between right and wrong, or to determine the answer to any properly ethical question; but it belongs to his business as a psychologist to show how the individual comes to distinguish between what is morally right and what is morally wrong.

It must not be supposed that psychical process as such necessarily involves the dis-

inction of subject and object. In principle it is possible to conceive a sentient being which should merely undergo changes of state without anything which could be called cognition. Such a being would have varied feelings without any distinction or recognition of their nature or of anything else. It would not be a conscious subject, but merely a feeling-thing. And even when the relation of subject and object exists, it does not follow that the whole content of the psychical life must enter into this relation. Part of it may have only such being as would belong to the feeling-states of the pre-subjective thing. It may well be that this mode of psychical existence belongs to the SUBCONSCIOUS (q. v.) as such.

This has an important bearing on the peculiar position of sensations in psychology. Sensations are both objects and psychical states. But they are not *subjective* states in the sense in which we are using the term subjective. Their psychical nature is such as might belong to them as states of a pre-subjective feeling-thing. In so far as they do enter into the subject-object relation, they fall to the side of the object rather than to that of the subject. But the fact that such objects are also psychical states in the sense explained invests them with a peculiar interest for the psychologist. He is not merely concerned with the process and conditions of their presentation as objects to a subject; he is also concerned with their own independent being and nature. Hence he carefully distinguishes their varieties, classifies them, investigates their qualitative affinities and relations, and inquires into the conditions of their production. If he investigated spatial relations in this way, he would cease to be a psychologist and become a geometrician. But all that can be known about sensations, it is the business of the psychologist to know. And the reason is that sensations, besides being objects, are also psychical, though not subjective, states.

(2) Psychology considers not only psychical processes, but also the conditions of their occurrence, which are only in part themselves psychical processes. Cf. CAUSE AND CONDITION. Thus it has to take account of the apparatus of sensation and movement. It is also compelled at every step to recognize the existence of mental dispositions inherited and acquired. Our actual conscious experience at any moment is determined by conditions which result from previous conscious experience. I

recognize a man to-day because I met him yesterday, although I may not have thought of him in the interval. This can only be because my experience of yesterday has left behind an after-effect, which persists through the interval and determines my present consciousness. This is an acquired disposition. Again, what are called in ordinary language love and hatred are acquired dispositions of a complex character rather than actual psychical processes. Love involves such actual conscious states as being glad at a person's prosperity, grieved at his misfortune, rejoiced to meet him, sorry to part from him, and so on. But these conscious states are merely partial manifestations of the sentiment of love, varying according to the special occasion. The sentiment itself is the permanent condition of these varying phases of emotion. Similarly, the difference between the musical faculty of a Mozart and that of a man who can hardly learn to tell one note from another is a difference in inherited disposition. There are two ways in which dispositions may be regarded by the psychologist. He primarily knows them by their effects on conscious process. They are, from this point of view, merely 'permanent possibilities' of consciousness. But he also has another clue in the correlation of mental states and occurrences with nervous states and occurrences. Dispositions have their physiological concomitants in permanent modifications of nervous tissue. Whatever doubts may be thrown on the principle of psychophysical parallelism, so far as regards actual conscious process, they seem to have no practical force in the case of dispositions acquired or inherited.

Other definitions. Wundt's definition agrees with ours. According to him, psychology 'investigates the entire content of experience in its relation to the subject' (*Grundriss d. Psychol.*, 3). Similarly Külpe: 'Psychology is the science of the facts of experience in their dependency upon experiencing individuals.' But he immediately adds that the individual referred to is the corporeal individual. Now, it may or may not be true that psychology cannot make any real progress except in the way of connecting psychical processes with bodily processes as their determining condition. But this view is by no means so well ascertained or so universally admitted as to justify its inclusion in the definition of the science. Some writers, e.g. Th. Lipps and J. Ward, attempt to give a systematic account of the mental life without

reference to bodily processes at all. A similar objection applies to Avenarius' view: according to him the problem of psychology is 'to consider experiences from the point of view of their dependence on the individual.' But he identifies the individual with the neural arrangements and processes immediately correlated with the occurrence of 'experiences.' A mode of definition, once common, but now little used, is by reference to the peculiar way in which psychical processes are supposed to be known. Thus Beneke: 'The subject-matter of psychology is whatever we apprehend by inner perception and sensation.' This is open to the criticism that inner sensation is not an intelligible conception, and that inner perception can only be distinguished from outer by the nature of its objects—these being psychical states as such. A sense organ is as necessary a condition of the perception of hearing as of the perception of sound.

(G.F.S.—J.M.B.)

Historical. Psychology as a systematic inquiry into psychical processes and their conditions may be said to have begun with Aristotle. His contribution to the subject is of real and abiding importance. In the first place, he is keenly aware of the intimate connection of body and mind. For him, conscious process is a phase of vital process. Soul ($\psi\upsilon\chi\eta$) is simply the principle of life, including vegetative and spontaneous movement, as well as sensation, memory, conation, and conceptual thinking. It must not, however, be supposed that he regarded life as a mere function of matter in the modern sense. The living body and its life are mutually dependent, and therefore relatively independent. You cannot have life without a body which lives; but, on the other hand, you cannot have a living body without a vital principle, which is more than mere bodily process. The body and its life together constitute one individual substance which cannot exist without both of them. In the second place, we owe to Aristotle the systematic distinction of stages or levels of mental process, so ordered that each higher stage presupposes the existence of the lower, but not conversely. Thus spontaneous locomotion presupposes vegetative process. But vegetative process does not presuppose spontaneous locomotion, and can exist without it, as in plants. Retentiveness and reproduction presuppose sensation. But sensation can exist without being retained or reproduced. Conceptual thinking presupposes mental imagery ($\phi\alpha\tau\alpha\sigma\iota\alpha$), containing revivals of pre-

vious sensation. But mental imagery can exist without conceptual thinking. This point of view may be regarded as containing the first suggestion of the genetic method in psychology. For Aristotle holds that in the ascending scale of animal life lower stages actually exist before higher, being followed and supplemented by these in progressive order, until in the fully developed human being they all combine in systematic unity. Finally, we owe to the Greek thinker many important discussions of special psychological topics. Among these we may refer to his elaborate and penetrating account of sense-perception and of its physical and physiological conditions; his enumeration of the different principles of association—similarity, contiguity, and contrast—and his explanation of dreams. As compared with modern psychology, Aristotle's procedure exhibits the characteristic shortcomings of Greek science. Its main tendency is towards mere classification, and hence it stops short with certain general conceptions, such as those of sensation, retentiveness, imaging, reasoning, &c. There is no systematic effort to analyse these processes so as to exhibit the factors which are at work in them and the laws and forms of their interaction. Thus, though Aristotle clearly recognizes the principle of association, he makes no extended use of it as a general clue to the labyrinth of psychical life. It is due to this habit of dealing with large and more or less vague generalities that psychological questions rarely assume for Aristotle such a shape as obviously demands for their solution minute, varied, and systematic observation of particular facts, to say nothing of experiment.

Yet Aristotle certainly made an excellent start, and it is perhaps not going too far to say that he did more for psychology than any other single man. In the interval between his work and the birth of modern science, it cannot be said that any signal advance was made in psychological principles or method.

We may regard Descartes, Hobbes, and Spinoza as representatives of modern psychology in its earliest period. Hobbes and Spinoza are convinced of the concomitance and covariation of bodily process and mental, and they freely use this principle as a key to psychological problems. Both, and especially Spinoza, give prominence to association as enabling them to reduce the complexity of mental life to relatively simple constituents, and to show how these come to be combined. Yet neither of them is a pure associationist. They are

saved from pure associationism by the essential part which the conception of conation (conatus) plays in their systems. Thus neither lose sight of the teleological unity of mental life, though this is more prominent in Spinoza. Descartes began a line of inquiry which now belongs to physiological PSYCHOLOGY (q. v., physiological).

The main interest of Locke was not psychological. But in an incidental way he made valuable contributions to the subject, and his thorough-going attempt to exhibit all our knowledge as due to combination and relation of the relatively simple data of sense-apprehension and reflection exercised a powerful influence on subsequent psychologists. He himself did not give or attempt to give any precise account of the laws and forms of the process by which his simple data are elaborated. He invented the term 'association of ideas,' but made little use of the principle so named. Berkeley partly supplies this defect by his account of the perception of external things, and our knowledge of the material world in general, as due to association of relatively simple sensory data. In this respect his theory of vision is important as a starting-point for modern genetic accounts of the perception of spatial relations. Hartley and Hume, and later the two Mills, bent on explaining all mental products as the result of the interaction of assignable factors according to laws capable of definite formulation, make use of the principle of association as the one key to all problems (see ASSOCIATIONISM). Hartley combines this with a thorough-going application of the principle of psychophysical parallelism and a most interesting theory of neural vibrations as the correlates of psychical processes and dispositions. In Germany, Herbart, with a similar ideal of scientific explanation, introduces other forms of interaction besides that of associative combination, in particular psychical arrest or inhibition. He also introduces the conception of psychical systems or 'masses' which act and are acted on as wholes. Further, he refers the fading away of presentations from consciousness to arrest, so that their disappearance is a transformation into unconscious tendencies, which rise again into consciousness when arresting conditions are removed. Thus he is enabled to make an extensive and systematic use of unconscious factors in explaining the course of mental life. Finally, we owe to him the first thorough-going attempt to trace the origin

and development of our apprehension of spatial and temporal relations.

We now come to what is termed the 'new' psychology. The work of such men as Hartley, James Mill, Bain, Condillac, Herbart, and Beneke had gradually given more definite and specific shape to psychological questions, so that more precise, detailed, and extensive use of empirical material became both needful and possible for their solution. In the main these writers confined themselves to the facts of every-day life collected from examination of the contents and processes of their own minds and from observation of other men. But their industry brought psychology to a point at which it could utilize manifold new sources of information. Access to these has mainly been opened out to it by the progress of science in general. The modern development of the physiology and pathology of the nervous system and the organs of sense has been of great importance in this respect. Compare, for instance, Hartley's theory of vibration with the physiological psychology of Wundt. Biology, too, has made a most important contribution. The movement of thought, which virtually commenced with Darwin, has brought into effective operation that genetic method in psychology of which we find preliminary hints in Aristotle. As examples of this line of inquiry, we may cite Darwin's own book on the *Expression of the Emotion* and parts of his *Descent of Man*; Spencer's general account of psychical evolution in the ascending scale of animal life, which forms perhaps the most valuable part of his *Principles of Psychology*; and the detailed researches of Romanes, L. I. Morgan, Dahl, Wasmann, Bethe, Mills, and others.

Another field for genetic inquiry has been opened up in connection with anthropological investigations. We are already beginning to study and compare the manifestations of mind in uncivilized and barbaric peoples (*Völkerpsychologie*). Sociology is also beginning to receive attention. It is becoming generally recognized that the development of the individual mind in human beings is essentially dependent on social relations; and the study of the conditions of social development both helps psychology and is helped by it. The work of such men as Tarde (*Lois de l'Imitation*, &c.), Baldwin (*Social Interpretations*), and Durkheim (*Le Suicide*, &c.), exemplifies this line of research. Another application of genetic method, which has not been specially suggested or facilitated

ab extra, consists in the study of the mental development of children, as embodied in such works as those of Preyer, Baldwin, Miss Shinn, Sully, and many others.

What is, however, generally regarded as the characteristic and distinctive feature of the 'new' psychology is the use of experimental methods analogous to those of physics and physiology. It is worth pointing out that one of the earliest and most successful of psychological experiments is due to a physicist—embodied in Wheatstone's invention of the stereoscope. As the pioneers of the general movement, we may mention Weber, Fechner, Helmholtz, and Wundt. At present, as we know, psychological laboratories are found throughout Europe and America. Perhaps some of the votaries of this method exaggerate its relative importance; but there can be no doubt that the results already obtained by means of it are of very great value. These directions and movements of research, except the genetic, are all well represented in the *Principles of Psychology* of W. James.

If, however, we were called on to assign the most important advantage the 'new' psychology has over the old, we should have no hesitation in saying that it does not consist in the introduction of any one new method or new kind of material. It lies rather in the convergence of manifold different lines of inquiry, capable of yielding each other help, guidance, and verification. Among these, the old way of procedure by collecting, sifting, and systematizing the facts of mental life as observable in ordinary every-day experience still retains, and always must retain, its place. No one has found it possible to write a systematic psychology without it. (G.F.S.)

See the other topics PSYCHOLOGY; also GENETIC, CHILD, RACE, SOCIAL, INDIVIDUAL, VARIATIONAL, COMPARATIVE PSYCHOLOGY, PSYCHOPHYSICS; and cf. ANTHROPOLOGY, BIOLOGICAL SCIENCES, MORAL SCIENCES, SCIENCE, ETHICS, SOCIOLOGY, PSYCHICAL RESEARCH, and PSYCHIC AND PSYCHOLOGICAL.

Literature: SIEBECK, HARMS, DESOIR, each entitled *Gesch. d. Psychol.*; the *Histories of Philosophy*, passim; arts. *Psychology* in the *Encyclopedias* (*Encyc. Brit.* especially, by Ward); VILLA, *Psicol. Contemp.* (1898; Eng. and Ger. trans., 1901-2); BALDWIN, *Psychol., Past and Present*, *Psychol. Rev.*, ii; see also the other topics PSYCHOLOGY, and BIBLIOG. G, 1, b. Of recent comprehensive works, besides those already referred to, the *Psychol. Descrip. and Explan.* of LADD, the

Analytic Psychol. of STOUT, and the *Handb. of Psychol.* of BALDWIN, are mainly introspective; so also the treatises of BRENTANO, HÖFFDING, LIPPS, PAULHAN, and FOUILLÉE; the *Physiol. Psychol.* of WUNDT, the *Physiol. Psychol.* of LADD, the *Psychol. physiol.* of SERGI, the *Grundzüge d. exper. Psychol.* of KÜLPE, and the incomplete *Psychologie* of EBBINGHAUS, together with the laboratory works, *Course in Exper. Psychol.* of SANFORD, and *Laboratory Manual* of TITCHENER, are physiological and experimental. The genetic point of view is prominent in the *Lehrb. d. Psychol.* of JODL and the *Manual of Psychol.* of STOUT. The general works of VOLKMANN, DEWEY, REHMKE, HÖFLER, and MÜNSTERBERG represent epistemological points of view. A *Bibliothèque intern. de Psychologie expérimentale* of fifty small volumes is appearing, edited by Toulouse (vols. i-iii, 1900-1). Most of the general works contain bibliographies. (J.M.B., G.F.S.)

Psychology (biblical): see BIBLICAL PSYCHOLOGY.

Psychology (classification of topics in). The arrangement of the headings of psychological science on logical principles and for convenience of reference (as, for example, in the construction of bibliographical lists).

The following scheme is taken by permission from the *Psychological Review*, viii, 1 (Jan., 1901). It is used in the *Psychological Index*, vii, for 1900 (March, 1901). We quote from the introductory remarks of the editors of the *Psychological Review* (loc. cit.). (J.M.B.)

The responsible editors of this *Review* drew up for the purposes of the *Psychological Index* the classification of psychological material which has been used heretofore in that publication. The co-operation effected with the German and French reviews emphasized the need of a common scheme, and Professor Warren represented the *Review* in a conference held in Paris during the recent International Congress (1900). The agreements reached, together with certain alterations subsequently suggested, are now embodied in the following scheme. It is thought that this scheme—having thus the authority of an international committee, and embodying the opinions of experienced bibliographers of psychology—may have value for the wider use of public and private libraries, and we recommend it to all those who are interested in psychological classification. That it avoids all difficulties and inconsistencies, we do not

PSYCHOLOGY

pretend to say; it embodies compromises and considerations of utility.

'In the division headings two alternative schemes are presented: the "graded numerals" and the "decimal system." The *Index* continues to use the former; but others who wish to adopt the classification may prefer to use the decimal system.'

SCHEME OF CLASSIFICATION.

I. GENERAL	0.
1. Textbooks and Systematic Treatises	0.1
2. General Problems, Methods, Terms, and Apparatus	0.2-0.5

Psychology (empirical, rational): Ger. *empirische, rationale Psychologie*; Fr. *psychologie empirique, rationnelle*; Ital. *psicologia empirica, razionale*. Empirical psychology is psychology from which problems of metaphysics and epistemology are excluded; that is, PSYCHOLOGY as defined under that topic, and pursued by inductive and experimental methods. Rational psychology is the department of philosophy which deals with the nature of the mental principle in its relation to other forms of being, having such subordinate problems as the relation of MIND AND BODY (q.v.), the validity of knowledge (see EPISTEMOLOGY, 2), &c.

The distinction is rapidly going out of use, since the matter of rational psychology is being taken up by philosophy and epistemology, and the term psychology left to the other meaning. In theology, however, psychology of the 'rational' sort—often called pneumatology—is treated as a branch of theological ANTHROPOLOGY (q.v.; the theory of man in relation to God), of which somatology (theory of the body) is the other branch (cf. BIBLICAL PSYCHOLOGY). (J.M.B.)

Psychology (experimental): Ger. *experimentelle Psychologie*; Fr. *psychologie expérimentale*; Ital. *psicologia sperimentale*. Experimental psychology may be defined as that PSYCHOLOGY (q.v.) or branch of psychology which employs experimental methods and appliances in its investigations.

The phrase seems to have been first used by Wundt (*Beitr. z. Physiol. d. Sinneswahrn.*, 1862), who, in the introductory paragraphs of the *Physiologische Psychologie* (1874 and 1893), practically identifies experimental with physiological psychology. 'If we lay stress on peculiarity of method,' he says, 'we may call our science experimental psychology, as contradistinguished from the older doctrine of mind, of which the sole foundation was introspection.'

There is great difference of opinion in detail as to the meaning and application of the term 'experimental.' Some psychologists

restrict the efficacy of the experimental method to the simple mental processes; others declare that the whole of mind is accessible to experimental investigation. Some make experiment the check and control of introspection; others would replace introspection by experiment. Some assert that no observation is experimental whose results cannot be quantitatively expressed; others deny the possibility of quantitative work in psychology. Controversies upon such questions are natural in a young science, and more especially in a science whose subject-matter touches general human interests so closely. Their resolution must be left to time. (E.B.T.)

In France—and the usage is becoming more general—experimental psychology is used simply for psychology separated from metaphysics and treated by positive methods; it is an experimental science in the sense of being empirical and inductive. In this sense the chair of *Psychologie expérimentale* in the Sorbonne is named. (L.M.—J.M.B.)

A more restricted usage is also current in English, and in some degree in German, which limits experimental psychology to the method of experimenting which does not involve the organic physiological processes; this latter sphere of experiment, i.e. through the internal organs and processes, being called physiological psychology. This is substantially the same distinction as that between 'external' and 'internal' psychophysics mentioned under PSYCHOLOGY (physiological). (J.M.B.)

An early piece of psychological experimentation is Weber's investigation into touch and common feeling (1846: see HAPTICS); but scattered psychological experiments may be found in the works of such men as Bonnet, Tetens, Wheatstone. Weber's example has been followed by Fechner, A. W. Volkmann, Helmholtz, and Wundt in Germany, and by many others, more recently, in other countries. Several journals—the *Philos. Stud.* (1881 ff.), the *Zeitsch. f. Psychol.* (1889 ff.), the *Amer. J. of Psychol.* (1887 ff.), the *Psychol. Rev.* (1894 ff.), and the *Année Psychol.* (1895 ff.), in particular—devote much of their space to experimental psychology; and of the older journals, *Mind* and the *Rev. philos.* have published many experimental papers. Cf. LABORATORY AND APPARATUS, and the other topics PSYCHOLOGY. (E.B.T.)

See the other topics PSYCHOLOGY, PSYCHOPHYSICS, and REACTION TIME. Cf. also the experimental topics ATTENTION, MEMORY, MOVEMENT, OPTICAL ILLUSIONS, SENSATION, and the various special sensation headings. (E.B.T.-J.M.B.)

Psychology (physiological): *Ger. physiologische Psychologie*; *Fr. psychologie physiologique*; *Ital. psicologia fisiologica, or psicofisiologia*. The new psychology took shape from the confluence of two streams of work, the psychophysical and the physiological. Weber was early among the experimentalists; Fechner is called the father of psychophysics. Over against these men, on the physiological side, stands Lotze, with the *Medicinische Psychologie* (1852). Wundt combines the 'external psychophysics' of Fechner with the 'mental physiology' (internal psychophysics) of Lotze. His *Physiologische Psychologie* (four editions, 1874) defines the problem of physiological psychology as follows: 'It has, first, to investigate those vital processes which, standing midway between external and internal experience, require the simultaneous application of both methods of observation, the external and the internal; and secondly, from the point of view which it has gained in the investigation of these processes, to survey the whole realm of vital phenomena, and so, if possible, mediate a comprehensive theory of human existence.' Wundt makes no distinction between physiological and experimental psychology.

Rudiments of a physiological psychology can be found far back in the history of philosophy. Hobbes, in particular, is prominent in this regard among English philosophers. The sub-title of Lotze's work is *Physiologie der Seele*, and it was translated into French as *Principes de psychologie physiologique* [yet the

name is to be found earlier, in Chardel's *Essai de psychologie physiologique*, 1837—TH.Z.]. Carpenter speaks of mental physiology (1867), Maudsley of the physiology of mind (1874). Wundt used the phrase in 1874, as a matter of course. Ladd (*Elements of Physiol. Psychol.*, 1888) defines it as 'psychology approached and studied from the "physiological" side or point of view.' Ziehen (*Introd. to Physiol. Psychol.*, 1892) gives the following scheme:

- (1) Speculative psychology.
- (2) Empirical psychology.
 - (a) Autonomic (psychical process without concomitant cerebral).
 - (b) Physiological (psychical process with concomitant cerebral; integral part being metric physiological psychology, or psychophysics).

This classification has not, however, found any general acceptance. The fact is (cf. PSYCHOLOGY, the new) that the stream of thought running through Flourens (1842), Broca (1863), Fritsch and Hitzig (1870), Ferrier (1873), Munk, Goltz, Luciani, Tamburini, Horsley, Flechsig (*Gehirn u. Seele*, 1894), Exner (*Entwurf zu einer physiol. Erklärung d. psych. Prozesse*, 1894)—the physiological stream proper—has joined with the psychophysical stream to constitute modern psychology at large. Hence while individual authors may, for pedagogical purposes, classify and distinguish the new psychology, experimental psychology, physiological psychology, psychophysics, psychophysiology, &c., there is really no sharp line of demarcation to be drawn. It is significant that Sergi's work, published in 1879 in Italian as 'Elements of Psychology,' should appear in the French edition of 1888 as a 'Physiological Psychology.' Ebbinghaus' psychology might equally well be entitled either experimental or physiological psychology. (E.B.T.)

In France the tradition comes down from Descartes and Malebranche, through a series of medical authorities of the first rank—Cabanis, Esquirol, Maury, &c. The Société médico-psychologique preserved this tradition, and its influence was marked upon the work of Taine. More recently the pathological school—Charcot, Beaunis, Gley—have brought this movement into union with the two other great streams mentioned above, notably through their work in aphasia, hypnotism, disorders of personality, &c. (L.M.)

For a more restricted definition of physiological psychology—in the sense of the 'external psychophysics' of Fechner, mentioned

above—see **PSYCHOLOGY** (experimental). A note on the history of instruction in laboratory psychology is given under **LABORATORY AND APPARATUS**, I. Apart from work done under other names, especially in medical schools, possibly the earliest courses in physiological psychology proper, with demonstrations of brain anatomy and physiology, were those of James (about 1880) at Harvard, and McCosh, Osborn, and Scott at Princeton (1883). Cf. the other topics **PSYCHOLOGY**.

Literature: the works cited above; **BIBLIOG. G, 1, d**; see also **PSYCHOLOGY** (experimental). (J.M.B.)

Psychology (rational): see **PSYCHOLOGY** (empirical, &c.).

Psychology (the new): Ger. *die moderne Psychologie*; Fr. *la psychologie nouvelle*; Ital. *la nuova psicologia*. Modern psychology, in its experimental and physiological aspects; scientific as opposed to philosophical psychology. So we speak of the new physiology of Ludwig; the new pathology of Virchow; the new chemistry of Liebig.

The dividing line between the old and the new psychology may perhaps be found in the psychology of Herbart, who overthrew the psychology of faculties, while he still held fast to a metaphysical basis for psychology. Most of the prominent living psychologists have been strongly influenced by the 'new' psychology, even if they are not primarily experimentalists. So Brentano, Lipps, Jodl, Bain, Höfding, Ladd, James, Baldwin, Sully, Ward, Stout, Stanley Hall, Ribot, Paulhan, Fouillée, Rehmke, Ardigò, Sergi, Morselli, &c. (E.B.T.)

It is probable that the movement was prepared for by the British associationists and empirical thinkers, of whom J. S. Mill and Spencer may be especially mentioned (cf. Ribot, *Psychol. angl. contemp.*). With this movement note should also be made of the French school of mental pathologists (Charcot, Pierre Janet), whose methods and results are vitally incorporated in the body of the 'new' psychology. Cf. the other topics **PSYCHOLOGY**. (L.M.—J.M.B.)

Psychometry [Gr. *ψυχή*, soul, + *μέτρον*, a measure]: Ger. *Psychometrie*; Fr. *psychométrie*; Ital. *psicometria*. This term has been used as synonymous with experimental psychology or exact psychology. If retained at all, it is best confined to the department concerned with the measurement of the time of psychophysical and mental processes. See **REACTION TIME**. (J.M.C.C.)

It has been taken over by a form of new mysticism, and had better be abandoned by scientific psychology. The term *Psychometrie* was used by Wolff (*Psychol. Emp.*, § 522) for the mathematical treatment of psychological processes. (J.M.B., H.C.W.)

Psychomotor: Ger. *psychomotorisch*; Fr. *psychomoteur*; Ital. *psicomotore (-torio)*. Applied to action considered as following upon a mental state. See **IDEO-MOTOR**, and **SENSORI-MOTOR**; and cf. **DYNAMOGENESIS**. (J.M.B.)

Psychoneurosis: see **PSYCHO-**.

Psychonomic Forces. **FORCES** (q.v., figurative meanings) (1) which condition mental development, or (2) which, being of the psychological order, enter into and determine social change. The theory of these forces constitutes **PSYCHONOMICS** (q.v., also for derivation and equivalents). (J.M.B.)

Psychonomics [Gr. *ψυχή*, mind, + *νόμος*, law]: Ger. *Psychonomik*; Fr. *psychonomique*; Ital. *psiconomia* (these equivalents are suggested). Suggested to designate (1) that branch of science which investigates the relation of the individual mind to its (especially social) environment, after analogy with **BIONOMICS** (q.v.) and **SOCIONOMICS** (q.v.); and (2) that branch of **SOCIOLOGY** (q.v.) which deals with the psychological factors and laws involved in social organization and development.

This branch of inquiry treats, from the objective or sociological point of view, the data with which **SOCIAL PSYCHOLOGY** (q.v.) deals from the subjective or psychic point of view. (J.M.B., F.H.G.)

Psychoparesis: see **PSYCHO-**.

Psychopathology [Gr. *ψυχή*, soul, + *πάθος*, disease]: Ger. *Psychopathologie*; Fr. *psychopathologie*; Ital. *psicopatologia*. The general study of diseased mental conditions; a synonym of psychiatry and abnormal psychology, but rather more comprehensive than either, because it emphasizes the general scientific study of all forms of mental aberration. Its more precise synonym is mental **PATHOLOGY** (q.v.). See **PSYCHOSIS** (2).

As compared with abnormal psychology it emphasizes the pathological, while the latter term emphasizes the psychological point of view; nor does it as prominently as the latter term consider minor mental deviations. As a type of a treatise with this title see Emminghaus' *Allgemeine Psychopathologie*. The term psychopathist is occasionally met with as synonymous with psychiatrist. Psychopath is occasionally used, as synonymous with neuropath or neurotic, to indicate an

individual of abnormal mental make-up, but not necessarily insane. The use of psychopathology for psychotherapeutics or mind-cure is not correct. (J.J.)

Psychophysical Apparatus: see LABORATORY AND APPARATUS.

Psychophysical (Measurement) Methods: Ger. *psychophysische Massmethoden*; Fr. *méthodes psychophysiques*; Ital. *metodi psicofisici*. Methods for studying the relation between stimuli and sensations and the accuracy of perception; used more especially in the case of the measurement of intensity.

The methods are divided by Wundt into gradation methods and error methods. The gradation methods are the method of least noticeable difference and the method of mean gradation. The former, originally used by Weber, determines for different stimuli the difference in intensity or size that can just be noticed. The latter, introduced into psychology by Plateau, finds a stimulus apparently midway between two others. The error methods are the method of average error and the method of right and wrong cases. By the former, first used by Fechner and Volkman, one stimulus is adjusted until it appears to be the same as another, and the average error in a series of trials is calculated. By the latter, suggested by Vierordt, two stimuli are presented differing by a small amount, and the observer decides which appears to be the greater. All the methods give a constant error and a variable error. In order to separate these errors and to secure reliable results, various precautions must be regarded, which are discussed at length in the extensive literature relating to the subject. Cf. ERRORS OF OBSERVATION, FECHNER'S LAW, WEBER'S LAW, and PROBABILITY. Discussion and references to the literature will be found in Fechner's *Elemente der Psychophysik* (1860) and subsequent works, and in Wundt's *Physiologische Psychologie*. (J.M^cK.C.)

Literature: WEBER, *Annotationes de Pulsu, Resorptione, Auditu et Tactu* (1834); *Der Tastsinn u. das Gemeingefühl*, in Wagner's *Handb. d. Physiol.*, III. ii (1846); and *Annotationes Anatomicae et Physiologicae* (Lipsiae, 1851); FECHNER, *Zend-Avesta* (1851); *Elemente d. Psychophysik* (1860); *In Sachen d. Psychophysik* (Leipzig, 1877); and *Revision d. Hauptpunkte d. Psychophysik* (1882); WUNDT, *Grundzüge d. physiol. Psychol.* (4th ed., 1893); *Ueber die Methode d. Minimaländerungen*, *Philos. Stud.* (Leipzig, 1883); G. E. MÜLLER, *Grundlegung d. Psychophysik*

(1879); RIBOT, *German Psychol. of To-day* (Eng. trans., 1886); JASTROW, *A Critique of Psychophysical Methods*, *Amer. J. of Psychol.* (1888), i. 271; FULLERTON and CATTELL, *On the Perception of Small Differences* (1892); KÜLPE, *Outlines of Psychol.* (1895); EBBINGHAUS, *Grundzüge d. Psychol.* (1897-); VILLA, *Psicol. Contemp.*, chap. iv. (J.M^cK.C.—J.M.B.)

Psychophysics [Gr. *ψυχή*, soul, + *φυσικός*, physical]: Ger. *Psychophysik*; Fr. *psychophysique*; Ital. *psicofisica*. The term has been used as synonymous with experimental and physiological psychology. Better usage, however, confines it to that department treating the relations of physical stimuli to sensations, more especially their relations of intensity. Cf. FECHNER'S LAW, and WEBER'S LAW; and see PSYCHOPHYSICAL METHODS (also for literature).

The adjective 'psychophysical' is used in a somewhat wider sense, to designate the relation between mind and body. (J.M^cK.C.)

Psychophysiology: see PSYCHO-

Psychosis [Gr. *ψύχωσις*, a giving of life or soul, animating]: Ger. *Psychose*; Fr. *psychose*; Ital. *psicosi*. (1) Used with regard to normal processes, psychosis is equivalent to the mental or psychical element in a psychophysical process, just as neurosis refers to that aspect of the process which belongs to the nervous system. The term simply designates this factor without implying any theory of relation of the mental to the physical (see Huxley, *Automatism*, 1874, and elsewhere).

(2) Used as equivalent to the total state of consciousness existing at any one moment (see Stout, *Manual of Psychol.*, 71). In Ladd (*Psychol., Descrip. and Explan.*, 661) the term is a general designation for all concrete psychic facts. (J.J.—J.M.B.)

(3) Used pathologically (and in this sense the usage is rapidly gaining ground both in foreign and in English literature), the term designates an abnormal mental condition, especially inasmuch as it is correlated with a specific disease-process (a 'disease-entity,' if the term be allowed) with characteristic origin, course, and symptoms. The typical forms of insanity which can be scientifically differentiated would rank as psychoses in this sense.

It may be useful to illustrate the nature of a disease as a pathological process of definite etiology, typical manifestations, characteristic course and termination. Thus typhoid fever is a disease produced by an infection of the intestinal tract by a specific bacillus, proceeding as a swelling, necrosis, and healing of the affected parts, with a consequent auto-intoxi-

cation due to the abnormal parasitic presence or symbiosis. So, too, diabetes, although no definite cause of it is known, is a disease, because it presents recognizable criteria (non-elaboration of the sugar in the blood, and its elimination with the urine), and presents a fairly definite course and complex of symptoms. Hemiplegia, however, although a definite symptom-complex, is not a disease, but a residual, due to the transitory or permanent interruption of the cerebral efferent pathway. The disease-process leading to it is usually a vascular disorder, either at the point of damage, as in hemorrhage or thrombosis, or in the heart or aorta, as in embolism.

A further distinguishable type of pathological abnormality is represented by the disorders produced by abnormal development; these may be due to conditions of the environment, or may be irregularities of the balance of function of special organs (such as cretinism and myxoedema due to disease of the thyroid gland), and yet in other instances we have no factor to account for the abnormality except that of heredity. The fundamental purpose of pathology (i. e. the study of abnormal life, not merely morbid anatomy and bacteriology) is a recognition of actual disease-processes and of the natural relation of symptoms.

The introduction into psychiatry of the principle of pathology, that the study of the natural development and causal relation of symptoms should replace the speculative analysis of single features (e. g. 'delusions on special topics,' hallucinations, or more complex groups of symptoms, like excitement, depression, &c.), was mainly due to Kahlbaum, and has been notably furthered by Kraepelin and his followers. For this purpose the effort to determine definite disease-processes in psychiatry is undoubtedly the most fruitful and helpful method, although it is not so easy to pursue as in the disorders of the non-psychic mechanisms. It seems possible to distinguish the following types:

(a) Aberrations in growth and fundamental development (a) not of the character of a real disease-process, but referable to poor heredity (Anlagen) and unfortunate external conditions of growth, or (b) due to actual disease-processes, affecting the brain directly or indirectly (traumatism at birth, meningitis, encephalitis, &c.).

(b) Disease-processes of an etiologically vague character, called constitutional, but of remarkably well-defined symptomatological

and clinical nature: epilepsy, hysteria, constitutional neurasthenia, manic-depressive insanity (mania and melancholia), and paranoia.

(c) Disease-processes on the basis of an intoxication (alcoholism, cocaineism, morphinism), or exhaustion, or auto-intoxication (myxoedematous insanity and general paralysis), and yet others which depend on unknown consequences of developmental and involutional irregularities, especially in the sexual sphere: as perhaps the processes of deterioration, dementia praecox, and certain forms of paranoic condition, and, in the period of involution, of melancholia, &c.

(d) As residuals may be classed the terminal dementias, certain paranoic conditions, recovery without insight into the morbidity of abandoned delusions, &c., comparable to the formation of scars and defective readjustment after the active disease-process has disappeared.

At first sight this general biological outline may appear unimportant to the psychologist; but disregard of such principles is bound to lead to serious misconceptions in the valuation of the current nomenclature of mental diseases in the psychiatric literature and in the actual problems of psychopathology. A short discussion of this point seems warranted by the recent introduction of psychophysical and psychological methods into psychiatry and the resulting reaction upon normal psychology. We must distinguish the following groups of concepts:

(i) The elementary abnormal symptoms: disorders of sensation (including hallucinations), of memory, of the stream of thought, of elaboration of impressions (orientation), of attention (indifference or distractibility), of self-direction, of various states of consciousness, activity (inhibition, retardation, or facilitation), &c.

(ii) The symptom-complexes, i. e. sufficiently frequent combinations of symptoms to form definitely recognized groups or pictures, such as the symptom-complexes of exaltation (as in mania), depression (as in melancholia), delusional states with only little or no formal disorder (paranoia), or confusion, and delirium. Most of the descriptions of mental diseases published are mainly descriptions of symptom-complexes, many of which cannot make any pretensions to be recognized as disease-entities. For sketches of these symptom-complexes see MANIA, MELANCHOLIA, MORAL INSANITY, and PARANOIA.

(iii) Pathological anatomy furnishes complexes of manifestations which are frequently called 'pathology,' but are not necessarily more characteristic of the disease-process than the symptom-complexes which can be ascertained before death, although in the present state of biology its data appeal to many medical minds more than the less permanent and tangible ante-mortem symptom-complexes, which are all the more apt to be used loosely, because they are so similar to what we experience in normal life, and do not, at first sight, require many critical checks against fallacies of common sense.

(iv) The fundamental aim of a scientific study of mental diseases is, however, to study the special symptoms and symptom-complexes in the course of the disease, with a view to determine the disease-process or disease-principle underlying the whole complex of deviations from the normal. Considering the variability of the symptoms in individual attacks and in different persons, we depend for the definition of the disease-principle on the conditions of origin (etiology), the general course of the disease and its termination, and the fundamental features which are present in every case of a disease-entity, and lie at the bottom of the various forms of manifestations in the psychic, 'physiological,' and anatomical spheres.

The study of fundamental symptoms demands two series of psychophysical studies:

(a) A knowledge of individual variations (VARIATIONAL PSYCHOLOGY, q. v.) adapted to the needs of mental pathology.

(b) A knowledge of new modifications of reactions introduced by any definite disease-process in analogy with the study of the psychophysical reaction to poisons, to exhaustion, to the strain of powerful emotions, &c. Only in this way shall we learn to know the symptomatic *equivalents* of a certain disease-process.

For the purposes of psychopathology it is not sufficient to speak of a 'case of mania or melancholia,' but it is necessary to give definite data as to the disease-type in order that the results may be of comparative value. Our present ignorance of the disease-process in numerous instances met in practice does not alter the stringency of this requirement. Its recognition dictates the policy of beginning more serious work with the known *fundamental* deviations, and then proceeding to the study of the symptom-complexes, and especially of the elementary symptoms, so far as they

can be traced in their evolution. Ordinary clinical psychopathology offers many a warning. That Clouston calls about 50 per cent. of all admissions to his hospital cases of mania, while Garnier so describes only 6 per cent. of the Paris admissions, or Forel 8 per cent., is an illustration of the fallacies of psychiatric nomenclature. A demonstration of the insufficiency of a symptomatic nomenclature is seen in general PARALYSIS (q. v.), where the most varying symptoms may superficially dominate the picture, or katatonia, where the repeated shifting of symptom-complexes would force us to accept the presence of three or four or more successive 'diseases.' We cannot insist enough on the principle followed by modern psychiatry: that it is not an attempt to unite mental disorders into such pictures as will above all appear plausible from the point of view of systematic psychology, but rather the collection and digestion of facts with a view to a broad pathology of human life, reserving for itself the right of working out a system of psychology planned according to its own requirements.

Literature: the best historical statement of this problem is KAHLBAUM, *Die Gruppierung der psychischen Krankheiten und die Eintheilung der Seelenstörungen* (1863). The best modern presentation of psychiatry, and one which does justice to the above-mentioned principles, is KRAEPELIN, *Psychiatrie* (1899). An excellent exposition is by AUGUST HOCH, *The Study of Psychiatry*, Amer. J. of Insan., Oct. 1900. (A.M.)

Psychostatics: see PSYCHO-

Psychotherapeutics or Psychotherapy [Gr. *ψυχή*, soul, + *θεραπεύειν*, to heal]: Ger. *Psychotherapie*; Fr. *psychothérapie*; Ital. *psicoterapeutica*. The treatment of disease mainly or wholly by direct and indirect appeal to or utilization of the influence of mental conditions upon bodily states.

The term serves a useful function as the equivalent of the legitimate factor in the scientific treatment of disease, which utilizes and directs, examines and interprets such mental influences. There are many more or less extreme systems which depend upon similar principles, but present them under unwarranted and fantastic theories, or combined with irrelevant notions and practices. Some of these are noticed under FAITH CURE and MIND CURE (q. v.).

The recognition of the mutual influence of mind and body is one of the fundamental tenets of modern psychology. That bodily

states condition mental processes is abundantly proven by the existence of mental diseases traceable to degenerations of specialized parts of the central nervous system, by the action of drugs, by the mental results of fatigue and ill health and of bodily injuries, by an endless series of every-day observations, and by the systematic experiments of the laboratory. That mental processes tend to have motor expression, and that concentrated attention or consciousness may interfere with the normal functioning of bodily processes, are evidenced in every-day matters by blushing, by the effect of embarrassment (upon speech), of fear (upon movement), of panic, of stage fright, of anxiety or nervousness (upon heart-beat or respiration), as in the moments preceding an appearance before the public. Witness the difficulty of swallowing a pill when too consciously intentioned. In extreme cases even death has been produced by fear or anticipation. Psychotherapeutics properly includes a recognition and utilization for purposes of treatment of all these factors.

One may recognize (1) a general psychotherapeutic effect, and (2) special psychotherapeutic treatment; in both of which the methods may be in various degrees direct or indirect. (1) Any general influences which affect the success of medical treatment, such as the inducement of confidence in the physician on the part of the patient, the assuaging of unreasonable fears, the general tranquillization of the patient by sympathy and encouragement or, it may be, by stern counsel and masterful direction, and by a congenial and care-free environment, are thus psychotherapeutic influences. Indeed, in this sense it seems proper to enumerate diversions and recreations, interesting occupations and changes of scene, congenial companionship, and any of the good events of life, as indirect, but at times important, psychotherapeutic aids. (2) But the associations of the term are in the main more specific. They refer, apart from definite systems and processes, to appeals to the imagination, to the impressive effects of mystic processes and elaborate procedures, to appeals to faith, to the efficacy of prayer, and, in short, to the production, in a manner suitable for each individual, of an attitude of hopefulness and confidence of recovery, which undeniably contributes to a convalescent tone of the nervous system. The patient who imagines that the placing of a thermometer in his mouth is a therapeutic procedure is distinctly benefited by this belief; the

whirr and buzz of an electric machine, the imposing action of magnets, act on the same principle as sugar pills which are believed to be potent medicines, or as the conviction of faith in response to prayer. Such forms of action are classified as suggestion (cf. HYPNOSIS and SUGGESTION), and Suggestive Therapeutics becomes a proper term for systems which proceed upon this principle. Hypnotic suggestion is the most important of such systems, and is practised by not a few specialists in all countries; it is used in connection with ordinary medical practice by many more.

While the statistics of alleviation by this method are not uniform, there is sufficient evidence of the success of the method in a very considerable number of cases, as well as of its applicability in cases where other forms of procedure are less likely to succeed. Its most pronounced success is in the treatment of functional nervous disorders, of insomnia and hypochondria, of neuralgia, neurasthenia, pseudo-paralysis, perverse habits, such as the use of drugs (morphine, opium, chloral), motor troubles, such as choreic spasms, stuttering, occupation neuroses, and the like. The mere hypnotization is often of benefit, especially in cases of insomnia; and the anaesthesia thus produced has been utilized for surgical operations, both minor and severe. In addition, hypnotic suggestion has been helpful in a much wider range of diseases, in alleviating pain, in overcoming secondary impediments, and by contributing to a wholesome and tranquil mental tone. The claims sometimes urged that hypnotic suggestion is capable of removing organic disabilities cannot be substantiated (see HYPNOSIS, and HYPNOTISM, and literature there cited). The process involved in such treatment is an appeal to functions ordinarily beyond the reach of direct voluntary influences. The increased suggestibility of the hypnotic state offers a means of making an appeal to the deeper subconscious functions (see AUTOMATISM, and UNCONSCIOUS STATE). That similar effects can be produced by other appeals is altogether probable; and faith-cures and cures by relics and shrines, by prayer and 'divine healing,' present varieties of the same fundamental process. There are indications that psychotherapeutic methods, scientifically interpreted, will be generally and judiciously utilized in modern medicine, and not left for quacks and extremists to administer according to the precepts of irrational and dogmatic systems.

Literature: SCHRENK-NOTZING, art. Psychotherapie, in *Real-Encyc. d. ges. Heilkunde* (1898); ZIEHEN, art. Psychotherapie, in *Eulenburg's Lebrb. d. Allg. Therapie*, (1898), iii. 637-96; BERNHEIM, *Suggestive Therapeutics* (Eng. trans., 1889); TUKE, *Illustrations of the Influence of the Mind on the Body* (1884); TUCKEY, *Psychotherapeutics* (1889); REGIS, *Origin and Progress of Mental Medicine, Alien. and Neur.*, xv. 4; GODDARD, *Faith-Cures, J. of Psychiatry*, x. 3 (1899); JASTROW, *Fact and Fable in Psychol.* (1900), 29-38, 171-80. See also references in *DESSOIR*, *Bibliog. des Hypnotismus* (1888), and *Supplément* (1890). (J.J., J.M.B.)

Ptolemaic Theory: Ger. *Ptolemäisches Weltsystem*; Fr. *système de Ptolémée*; Ital. *teoria Tolemaica*. The theory of the system of the world set forth by Ptolemy in his *Syntaxis*.

Its fundamental propositions are: (1) The earth is a globe. (2) This globe is at rest in the centre of the world, the latter being represented by the celestial sphere. (3) The heaven or world makes a diurnal revolution around an axis which passes through the centre of the earth. (S.N.)

Puberty [Lat. *pubertas*, age of maturity]: Ger. *Pubertät, Mannbarkeit, Geschlechtsreife*; Fr. *puberté*; Ital. *pubertà*. Age at which the generative organs become capable of function. At this time the sexual organs practically complete their development, and male and female characters are assumed—form of body, voice, beard, mental quality, &c.

In the human race it is commonly stated to be between the ages of fourteen and sixteen years in men, thirteen and fifteen years in women, although varying with race, climate, social position, &c. It is accompanied by important and subtle mental and emotional changes and ushers in the period of ADOLESCENCE (q. v.).

Literature: the literature of ADOLESCENCE (q. v.), especially MARRO; H. EMMINGHAUS, *Die psychischen Störungen des Kindesalters* 1897), 179 f. (C.F.H.—J.J.)

Public [Lat. *publicus*]: Ger. (1) *Gemeinwesen, Publicum*, (2) *öffentlich*; Fr. *public*; Ital. *pubblico*. (1) All or part of the people of a given community taken collectively; e.g. the 'reading public,' the 'voting public.' (F.H.G.—J.M.B.)

The conception of a public arose in Greece, as afterwards in Rome (and probably at an earlier time in Egypt and Babylonia), when it became necessary to take account in civic affairs of men not descended from tribes that founded the city, and therefore not belonging

to patrician clans. The term is one of many that mark the transition from ethnic to civic organization—to civilization. In the English language, public has, from the earliest times, denoted *all* the people, without distinction of rank, relationship, or estate. Thus T. Elyot (*The Governour*, i. 1) makes publicke of equal extension with *populus*, in 'whiche worde is conteyned all the inhabitants of a realme or citie, of what estate or condition soeuer they be.' (F.H.G.)

(2) Pertaining to the people, e.g. open to (public news, press, &c.), administered by (public affairs, public institutions), suited or intended for (public acts), belonging to (public welfare), in the service of (public officer), the public (in sense 1). (J.M.B.)

Public and Private (in social psychology). That mental process or product which implicates more than one individual is, in so far, public; that which does not is private.

It is recommended that these terms have these meanings, replacing such loosely used terms as 'social' and 'individual.' Social psychology is the psychology of the individual and of society so far as they are public. It is an urgent problem to trace the public element in mental development.

Publicity is, therefore, that coefficient or signature attaching to a mental process or product which stamps it as having in it elements in the given sense public. And it is evident that, like so many other terms, it has two meanings, according as the psychic or the psychological point of view is taken (cf. PSYCHIC AND PSYCHOLOGICAL). Psychic or mental publicity involves the recognition, by the individual himself, of the implication of others in his mental state; he is conscious of its public reference (e.g. in shame or vanity). Thus Butler (*Sermons*, v) speaks of pity as a 'public affection.' Psychological publicity, on the contrary, may not involve such consciousness, but may coexist with psychic or mental privacy; such is, e.g., in the opinion of many psychologists, the consciousness of self. In other words, the psychologically public may be psychically IMMEDIATE (q. v.). Cf. Baldwin, *Social and Eth. Interpret.*, Index, 'Publicity,' 'Private.' (J.M.B., F.H.G.)

Public Law [Lat. *publicum ius*]: Ger. *Staatsrecht*; Fr. *droit public*; Ital. *diritto pubblico*. That part of law which looks mainly to public interests and relations.

In the pursuit of the remedies which it affords, the state is generally the actor. It comprehends the heads of Constitutional

law, Administrative (including Revenue) law, Criminal law, and Criminal procedure. Holland would also (*Jurisprudence*, xvi. 314) include the law and procedure applicable to the state, considered in its quasi-private personality, e.g. as an owner of property not employed for any public use. International law, so far as it is accepted in any state, is part of its municipal law, and is most properly assigned to its public law; though many jurists oppose this view on the ground that the state can owe no legal duty to another state, which can be the proper subject of a legal rule. See Pollock, *Jurisprudence*, iv. 96. Ecclesiastical law, where there is an established Church, is also a part of public law. See Markby, *Elements of Law*, § 305; and Bluntschli, *Dict. du droit public*. Cf. PRIVATE LAW. (S.E.B.)

Publicity: see PUBLIC and PRIVATE.

Pull Sensation: Ger. *Zugempfindung* (K.G.); Fr. *sensation de traction*; Ital. *sensazione di stiramento*. The sensation obtained when the skin is pulled upwards from the muscle; the reverse stimulus to that of PRESSURE SENSATION (q.v.). The term is recommended.

Run a string through a piece of court-plaster (or a postage stamp), and, the end being held by a knot under the plaster when the latter is stuck upon the skin, pull on the string. The sensation may be secured also by pulling upon a hair, though it is then difficult to isolate it as a distinct quality. The term 'traction' is sometimes used for pull; cf. Sanford, *Course in Exp. Psychol.*, 30.

Literature: HALL and MOTORA, *Amer. J. Psychol.* i. (1887) 93; BLOCH, *Arch. de Physiol.*, 5^e sér., iii. (1891) 322. (J.M.B.)

Pulse [Lat. *pulsus*, a beating]: Ger. *Puls*, *Pulsschläge*; Fr. *pouls*; Ital. *polso*. Rhythmical wave of tension through the arteries, arising from contraction of the heart.

In cases of great vascular dilatation the pulse may be transmitted through the capillaries to certain veins, or it may be present in the larger veins. See VASO-MOTOR SYSTEM. (C.F.H.)

Apparatus for recording the pulse beat, both as to rapidity and as to force, are in use. (J.M.B.)

Punishment [Lat. *punire*, to punish]: Ger. *Strafe*, *Bestrafung*; Fr. *châtiment*, *punition*, *peine*; Ital. *punizione*, *pena*. (1) The infliction of pain or other penalty upon a person for the violation of a regulation or command.

(2) In law: the infliction of pain or other

penalty upon a person for the violation of the laws or customs of a community of which he is a member. Cf. SANCTION.

Punishment takes various forms. It may consist in a mere rebuke or admonition. It may consist in a deferred sentence, which does not come into effect if the offender desists from committing further offences for a certain definite period. It may consist in taking securities for an offender's good behaviour in the future, from himself or from his friends. Sometimes punishment takes an economic form, in the shape of a fine or in the confiscation of his property. Sometimes it takes the form of depriving the offender of his liberty by committing him to a prison or to a reformatory institution. Sometimes the offender is subjected to corporal punishment, such as mutilation, flogging, and putting to death. The nature of the punishment inflicted on an offender depends to a great extent on the stage of civilization which the community in which he lives has reached. Among uncivilized and partially civilized races corporal punishment in all its forms is the most common method of dealing with offenders. As civilization advances, corporal punishment is supplemented and modified by economic punishments, such as fining and confiscation. In modern civilized communities corporal punishment is relegated to a very subordinate position in the penal code. Such punishments as branding and mutilation have altogether disappeared, and in some continental codes flogging and capital punishment have disappeared as well. The most common forms of punishment among civilized societies at the present day are admonition, securities for good behaviour, the deferred sentence, fining, and imprisonment. Corporal punishment, whether it takes the form of whipping, flogging, or the penalty of death, is only resorted to in a small number of cases; and although attempts are made from time to time to extend it, these attempts are as a whole unsuccessful. Penal codes are the growth of centuries, and are not based upon theories of punishment; yet the stamp of various theories may be found upon them. Nevertheless, it is correct to say that they are on the whole dominated by the retributive theory of punishment. According to this theory the supreme object of punishment is to impose a penalty on the offender which will correspond as nearly as possible to the character of the offence. If the offence is serious, the penalty will be correspondingly severe; if the offence is trivial, the punish-

PUNISHMENT

ment will be correspondingly light. According to this theory the principal end of criminal justice is to secure the person of the offender, to try him in accordance with the recognized rules of evidence for a certain specific offence, and, if convicted, to sentence him to the penalty attached by code or custom to such an offence. In countries where the penal law is codified, the code usually lays down a maximum and a minimum, which the judge is bound to observe. In countries such as England, where the penal law has not been codified, the judge has a wider discretion, but as a matter of fact his sentences are largely dominated by the customs of the bench, which almost supply the place of positive law.

The retributive theory of punishment, as it is embodied in penal codes and customs, has been considerably modified in its operation since the end of the 18th century. The philosophy of the 18th century was superficial in many respects, but it gave birth to the great humanitarian movement, which has, under various names, continued to gather in volume and strength. Under the influence of this movement the ferocious punishments inflicted on offenders in the name of retributive justice were largely mitigated. It was pointed out that the wholesale flogging, mutilating, and gibbeting which went on in the name of law were in most cases altogether out of proportion to the offences committed. These punishments were not acts of retribution, but acts of atrocious barbarity perpetrated in the name of justice. According to the dominant ideas of the 18th century, man is a free and rational creature; crime is an error of the will, and the offender must be dealt with by a kind of punishment adapted to the rational nature of man. Corporal punishment according to this view was suitable for brutes and not for men. The unspeakable squalor of prison life as it existed in the 18th century was an offence against the dignity of human life. The herding of all ages and both sexes in grim and gloomy establishments reeking with moral and material pollution came to be regarded as a degradation which no human being should be called upon to undergo. If a man had sinned against the laws of his country, it was considered as sufficient retribution to deprive him of his liberty, and when under detention to appeal to him as a rational creature and show him the error of his ways.

The results of the humanitarian movement on penal law have been beneficent in a variety

of directions. Punishment as a whole has been immensely diminished. Reformatory institutions have to a large extent taken the place of prisons for the young. In prisons the sexes have been separated; industry has been systematically introduced; the health of the prisoner has been better attended to; moral and spiritual influences have been brought to bear upon him when under detention; incitements to good conduct and industry have been devised, and in many countries the tendency of the judges has been to shorten the duration of detention. In cases of comparatively slight offences, imprisonment has been less and less resorted to, and such penalties as admonition, sureties, fining, and probation of first offenders have taken its place.

While the humanitarian movement has done much to mitigate the severities of the retributive principle, it has one defect in common with this theory. Both look at the offence rather than the offender, at the crime rather than the criminal. It is assumed that all offenders are alike, that all of them have the same mental constitution, that the acts of all of them are determined by the same conditions. If this assumption were correct, there would be some reason for measuring punishment by the nature of the offence. But when we look at the facts, we find that it is not correct to assume that all offenders are constituted alike or are subjected to the same external conditions. If we go through the corridors of a penal establishment and make a personal examination of the prison population, we shall find the widest divergences in the mental and physical characteristics of the inmates as well as in the external circumstances of their lives. We shall find a considerable percentage of them inferior to the average population in bodily or mental constitution, or perhaps in both. We shall find a high percentage who have been born and bred in the most miserable social and material circumstances. We shall find the young and the old, the vigorous and the enfeebled, the girl and the boy, the man and the woman, all shut up in the same establishment, and all subjected to almost exactly the same kind of punishment. This method of punishment would be unobjectionable if the theory of retribution is correct, for, according to this theory, you are to punish the offender in a way which will correspond with the gravity of the offence. It would also be unobjectionable if it were true that all offenders are alike, for in such a case, where two people have com-

mitted the same offence, it is only fair that they should receive the same amount of punishment. But a vast accumulation of facts go to show that the internal and external conditions of offenders differ enormously, and that the principle of similarity of punishment is inequitable and ineffective when applied to them. A proof of its inefficiency is to be found in the fact that in most civilized communities the number of offenders against the criminal law is increasing faster than the growth of population, and in the further fact that in a large percentage of cases the punishment inflicted has no effect in preventing the liberated offender from continuing a career of crime.

These facts have led to the rise of new theories of penal law and punishment. These new theories are based upon new views as to the conditions which produce the criminal population. It is the contention of Lombroso and his followers that the offender is abnormally constituted both in body and mind, and that his offence is merely the inevitable outcome of his abnormal constitution. These constitutional defects are partly atavistic and partly pathological; they consist in certain physical and mental peculiarities which can easily be discerned by a careful examination of the individual offender. Where the peculiarities are few in number or are not deeply seated, you have the 'occasional criminal,' who has no deep-rooted disposition to crime. His moral sense is weak, and he easily falls a victim to the stress of adverse external influences. Then, again, you have the 'criminal of passion'—persons of an irritable, jealous, revengeful temperament. These offenders are not deficient in moral sense, but they are at times swept off their feet by gusts of passionate impulse which hurry them into crime. In addition to these, there is a class of criminals who are either insane or are on the borderline between sanity and insanity—men of unstable equilibrium, suffering from nervous weakness or exhaustion. Some authorities consider that this class constitutes 10 per cent. of the prison population. Another class are the 'habitual criminals.' This is a large class, and is made up of vagrants, petty thieves, and professional criminals. They are chiefly offenders against property, and are partly the product of adverse social circumstances and partly of inherited mental defects. Finally, there is the class of 'born criminals.' Mentally, this class is without moral sense, brutal, precocious, thoughtless, and on a level with the savage in general mental characteristics.

They also resemble the savage in physical appearance—with a retreating forehead, projecting ears, a heavy lower jaw, a badly shaped skull and face, and other characteristics which point to atavism. These born criminals are considered to be practically incorrigible. The school of writers who classify offenders in the manner which has just been mentioned are called criminal anthropologists (cf. CRIMINAL). They take this name because they look upon crime as the outcome of the anthropological condition of the offender, that is to say, of his mental and physical constitution. Punishment they do not regard as an act of retribution, but as a means of social protection. The end of punishment is not retributive, but utilitarian—namely, the protection of society. This end is most effectually achieved by adapting the punishment as far as possible to the characteristics of the offender. Its general method is to exclude the offender from social life until he is presumed to be fit to re-enter it; and if he is never fit, as is supposed to be the case with the born criminal, he is permanently excluded from social life. In fact, the outcome of the teachings of the criminal anthropologists, in so far as imprisonment is concerned, is the indeterminate sentence. The offender is kept in detention till it is believed that he has ceased to be a danger to society.

It will be observed that the anthropological school attribute criminal conduct in the main to the individual conditions of the offender.

Another school of writers has arisen in recent years in France and Germany who maintain, in opposition to the anthropological school, that it is not so much the individual conditions as the social conditions of the offender which are the chief causes of crime. This school is known as the school of criminal sociology. Offences against the criminal law, according to the criminal sociologist, are a product of the wretched social circumstances, and more particularly of the wretched economic circumstances, of the delinquent. The existence of the born criminal is questioned; criminals are divided into two great classes—'occasional' and 'habitual' criminals.

The truth seems to lie between the two views. The criminal is partly a product of adverse individual conditions and partly a product of adverse social conditions, and as a rule a product of both sets of adverse circumstances acting in combination. The sociological school is in agreement with the anthropological as to the principles of punishment.

It considers that the supreme object of punishment is social protection, and maintains that punishment should be individualized and adapted to deal with the conditions which have produced the offence. It considers repression to be necessary, but it regards repression as of comparatively little value as a means of diminishing crime. Repression does not touch the conditions from which crime arises; in most cases it aggravates these conditions. Its value is therefore exceedingly small. According to the criminal sociologist, it is to an enlightened system of social politics, and not to schemes of punishment, that we must look for a diminution of crime. If crime is a product of the social and economic conditions of the community, the way to reduce it is to better these social and economic conditions. Punishment does not touch these conditions; it does not touch the sources of crime, and it is this fact which makes it of so little utility as a deterrent to the offender or as a permanent protection to society. (W.D.M.)

From the psychological point of view certain principles seem to be involved which lie at the root of the various theories of punishment. (1) The retributive theory is based upon the early sense of JUSTICE (q. v.), into which the motive of revenge enters, carrying with it the notion of guilt. Punishment is then a substitute for private vengeance; and as it is doubtful whether justice, as social recognition of equality of rights and obligations, could have arisen without this rude motive of revenge, so is it doubtful whether socially regulated punishment could have been constituted without the rude recognition of guilt which is correlated with vengeance. (2) The basis of the reformation theory of punishment is to be sought, no doubt in part, in the disciplinary value of pain in personal and social training. Pain is nature's penalty for the violation of law. Even in the training of animals punishments are involved, though to a less degree than are rewards. With children the discipline of pain holds its place, even before the excessive emphasis now often laid upon the 'softer way of love.'

In the consciousness of the child both these reasons for punishment seem to be normal and to be justified during his social growth. He responds to pain, and the restraint of fear is vital and effective. At the same time, we find him insisting upon the rude form of justice mediated by revenge and based upon guilt. He demands that his wayward play-fellow be punished for his deeds.

Objectively considered, the adjustment of punishments is a function of social welfare. This is seen in certain great outstanding sanctions, such as those attaching to the violation of marriage vows, where the difference in severity of penalty for man and woman seems to be wellnigh universal. Among the ancient Hebrews, says McCurdy (*History, Prophecy, and the Monuments*, iii. 89), 'the infidelity of the husband involved no separation from his wife, while that of the wife or betrothed maiden might be a capital offence according to the decree of the head of the family (Gen. xxxviii. 24).' Much the same is true among the most civilized peoples to-day; and it is easy to see why it is socially necessary that the woman's penalty should be severe, apart altogether from personal and physiological considerations which might in part justify such inequality. For the preservation of the family the first essential is the mother's nursing, care, and training of the children. Desultoriness in the woman's sexual relations destroys home life and domestic training, and social penalties for it must be severe enough to preserve the family. But desultoriness on the part of the man does not have the same effects, and consequently it is socially not so great a crime. In cases in which the distribution of labour in the family is reversed—if such there are—where, that is, the man is the mainstay of family life, the penalties might possibly be reversed so far as this consideration goes. And in a society so developed that the family, with its form of training, is not essential nor of extreme importance, nor so developed that sexual relationships are largely divorced from the production of children (sexual relations having no results)—in either of these cases this ground for the disparity of social penalties would be removed. In countries, indeed, where the illegitimate birth-rate is low, but where sexual licence is at the same time great, as in France (cf. MORAL STATISTICS), equality of man and woman in respect to marital infidelity tends to be established.

Theories of punishment, in short, have to deal not only with what may be called the normative—what ought to be—with retribution, reform, &c., but also with the demands of social utility—what has been and is fit to be—in a society which develops in this or that way (cf. SOCIAL EVOLUTION). We cannot make deductions from fixed ethical principles, nor can our sense of 'humanity'

be our only guide. The case cited shows that social right and wrong have degrees, and that the particular form of convention or law is often determined genetically, on the basis of utility. This particular case, indeed, shows how an ethical principle may have different social applications (here as between man and woman), and how there may be exceptions or tolerations inside of a general formulation. It is often said that law must deal with crime, not with the criminal; must generalize action and attach its penalty to such and such an offence, no matter who commits it; yet from the case cited, we see that such generalizations may in their application be only partial. As a matter of fact the judges and courts recognize this. (J.M.B.)

Punishment (in theology): Ger. *Bestrafung*, *Strafe*; Fr. *peine*, *punition*; Ital. *punizione*. Suffering inflicted as a penalty for wrongdoing; it is either disciplinary or retributive in its purpose.

Disciplinary punishment has for its aim the purification and reform of its subject, and is temporary in duration. Retributive punishment is the reward of the ungodly and finally impenitent, and has no definable limit of duration. Cf. RETRIBUTION, and REWARD AND PUNISHMENT.

Literature: EDWARDS, The Salvation of all

Men strictly examined; EDWARD BEECHER, The Doctrine of Scriptural Retribution; HUNTINGDON, Conditional Immortality. (A.T.O.)

Pupa [Lat. *pupa*, a doll, girl, fem. of *pupus*]: Ger. *Puppe*; Fr. *pupe*; Ital. *crisalide*. The second or quiescent stage in the metamorphic development of INSECTS (q.v.). See CHRYSALIS.

Literature: PACKARD, Entomology; LUBBOCK, The Origin and Metamorphosis of Insects (1874). (C.S.M.)

Pure (in philosophy) [Lat. *purus*, clean]: Ger. *rein*; Fr. *pur*; Ital. *puro*. Free from all admixture with extraneous, foreign, or irrelevant matter; expressing the intrinsic essence or end, and containing nothing else; containing no reference to application or use, as pure mathematics. As a technical term, it translates Kant's 'rein' as applied to reason, ego, concept, &c., denoting entire absence of any empirical element or factor arising from experience; equivalent to *a priori*.

Spatial determinations, like geometrical extension and figure, for example, belong to the pure form of perception, being distinguished from hardness, colour, &c., which belong to sensation. Kant probably borrowed this use of the term from Wolff (see his *Vern. Ged.*, § 282). He was followed in it by Fichte, Schelling, and Hegel. (J.D.)

In logic: unmixed, unmodified. The expression 'pure reason' goes back as far as Anaxagoras ('Αναξαγόρας εἴκοι μὲν ἕτερον λέγειν ψυχὴν τε καὶ νοῦν . . . χρῆται δ' ἀμφοῖν ὡς μὴ φύσει, πλὴν ἀρχὴν γε τὸν νοῦν τίθεται μάλιστα πάντων "μόνον γοῦν φησὶν αὐτὸν τῶν ὄντων ἀπλοῦν εἶναι καὶ ἀμυγῇ τε καὶ καθαρὸν"—Aristotle, 405 a 13). It is interesting to note Aristotle's understanding of the word here. The expression occurs in the injunctions of the dying Cyrus: *ὅταν ἄκρατος καὶ καθαρὸς ὁ νοῦς ἐκκριθῇ, τότε καὶ φρονιμώτατον εἶκος αὐτὸν εἶναι*. *Intellectus purus* is used by St. Augustine. This expression and *cognitio pura* were much used by Cartesians and Leibnitzians to signify freedom from admixture of sense-elements.

Pure act, *actus purus*, means pure form without matter, or energy without admixture of potency. It is a term of Aquinas and all other Latin peripatetics. The doctrine that God is form, *actus*, *ἐνέργεια*, is in Aristotle, *Met.*, Δ. vii; but the adjective does not occur there.

Pure apperception, a term which Kant explains at length in the third section of the first edition of the *Reduction of the Categories*.

It cannot be understood at all without reading Kant very attentively.

Pure concept: in Kant's doctrine, a concept imposed upon experience by the mind, not derived from it (*Krit. d. reinen Vernunft*, I. Aufl., 220).

Pure conversion, in logic, is an unusual equivalent of SIMPLE CONVERSION (q. v.).

Pure intuition: in Kant's doctrine, the pure form of sensuous intuitions, 'which can be known *a priori* before all actual perception.' But it is impossible to suppose that Kant meant here previous in time to all perception. Indeed, it is by no means clear that Kant held that pure intuition, in the state of pure intuition, could come into consciousness at all.

Pure judgment: see *Pure proposition*, below.

Pure knowledge: knowledge of which sensation is not an element.

Pure logic: a phrase often used, but to which no distinct conception can be attached. The following explanation by Hamilton (*Lects. on Logic*, App. I) is as good an explanation as can be given: 'The doctrine which expounds the laws by which our scientific procedure should be governed, in so far as these lie in the forms of thought, or in the conditions of the mind itself, which is the subject in which knowledge inheres—this science may be called *formal*, or *subjective*, or *abstract*, or *pure logic*. The science, again, which expounds the laws by which our scientific procedure should be governed, in so far as these lie in the contents, materials, or objects about which logic is conversant—this science may be called *material*, or *objective*, or *concrete*, or *applied logic*.' Perhaps we may say that *pure logic* is a logic deduced from hypotheses (which some will look upon as axioms) without any inquiry into the observational warrant for those hypotheses.

Pure power, *potentia pura*, is matter without form, *δύναμις* without energy or act.

Pure probation, or *proof*, is proof by deduction from hypotheses, or axioms, without any inquiry into the observational warrant for those premises. Such is the usual reasoning of geometry.

Pure proposition, *enunciation*, or *judgment*: a proposition *de inesse*, a proposition not affected by modality. The pure proposition, as something merely proposed or contemplated, might be considered as a sort of problematic proposition. But, in fact, it is generally identified with the assertory proposition.

Pure reason: in Kant's doctrine, the faculty of cognizing principles of knowledge quite *a priori* (*Krit. d. reinen Vernunft*, I. Aufl., II, also 305, where the matter is explained at length, and the whole transcendental dialectic relates to pure reason).

Pure representation: in Kant, a representation, or immediate object of knowledge, which involves no experiential element (*Krit. d. reinen Vernunft*, I. Aufl., 20, 50).

Pure syllogism: (1) properly, a syllogism both of whose premises are pure propositions.

(2) Applied by Kant to a syllogism in one of the direct moods, *Barbara*, *Celarent*, *Darii*, *Ferio*. Kant's doctrines of formal logic are very hasty, superficial, and inconsequent.

Pure synthesis: with Kant, the synthesis of a manifold not empirically given (*Krit. d. reinen Vernunft*, I. Aufl., 77).

Pure taste: taste directed to beauty exclusively, not to other pleasing elements, such as magnificence, lubricity, fun, &c. (C.S.P.)

Pure Experience: a translation of *reine Erfahrung* (cf. *PURE*). The two principal usages are: (1) Pure experience is a mere succession of sensations, feelings, or images. As this is never experienced in ordinary life, Wundt, for example, calls it 'a conceptual fiction.'

(2) In contrast to such a psychological analysis of experience into its elements Avenarius (*Krit. d. reinen Erfahrung*) denominates the world of the ordinary man the world of 'pure experience.' Reflection on this pure experience of every-day life leads to science and philosophy. (R.H.S.)

Purgatory [Med. Lat. *purgatorius*, a place of cleansing, from *purgare*, to cleanse]: Ger. *Fegefeuer*; Fr. *purgatoire*; Ital. *purgatorio*. A process of purification by suffering in an intermediate state after death, by means of which the departed soul is fitted for a higher state of existence.

Specifically, the state in which, according to Roman Catholic theology, the soul of the penitent who has died in the faith is purged by suffering from venial sins and from the temporal effects of mortal sins already forgiven.

Purgatory, in its general sense, is a feature of the doctrine of transmigration in Eastern and Western thought. As held specifically by the Roman Catholic Church, it is not in any sense an extension of probation, but is purely expiatory in its character. Only penitents are admitted into purgatory. The Romish Church teaches that the inmates of purgatory

may be aided by the Sacrament of the Mass and by the prayers and offerings of the faithful.

Literature: BERINGTON and KOSH, Faith of Catholics (3rd ed., 1846), iii. 140-207; LOWNET, Le Purgatoire d'après les Révélationes des Saints (1880); ALGER, Hist. of the Doctrine of the Future Life; MARSHALL, Doctrine of Purgatory. (A.T.O.)

Puritanism [Lat. *purus*, pure]: Ger. *Lehre der Puritaner*; Fr. *Puritanisme*; Ital. *Puritanismo*. A name applied to the politico-religious movement which led to the English revolution of 1644 and the establishment of the Commonwealth under Cromwell.

Puritanism originated in the 16th century as a religious movement in opposition to the lax morality of the time and the alleged Romish tendencies of the English episcopacy. It became political also in the 17th century, and was the chief agency in bringing about the overthrow of monarchy and the establishment of the Commonwealth. After the Restoration it ceased to be a political force of importance in England. English Puritanism is deeply indebted to Holland, from whose politico-religious struggle against Spain it derived its most important inspiration. Transplanted to America, Puritanism became the most important single factor in shaping the destinies of the new Commonwealth.

Literature: D. NEAL, Hist. of the Puritans (London, 1822); STOWELL, Hist. of the Puritans in England (London, 1878); L. BACON, Genesis of the New England Churches (N. Y., 1874); D. CAMPBELL, The Puritan in Holland, England, and America (N. Y., 1893); E. H. BYINGTON, The Puritan in England and New England (Boston, 1896). (A.T.O.)

Purity (in ethics) [Lat. *puritas*]: Ger. *Reinheit*; Fr. *pureté*; Ital. *purità*. Elevated habit of mind in all ethical relationships, especially in those involving what is sensuous.

The term is often restricted to sexual relationships (cf. CHASTITY). It is also often pressed into the service of prudery and moral scrupulosity and purism. It is interesting as having been used to illustrate Aristotle's virtue as a mean, and as being the subject of many proverbs—'To the pure all things are pure,' 'Honi soit qui mal y pense,' 'As a man thinketh in his heart, so is he.' (J.M.B.)

Purity (in psychology): Ger. *Reinheit*; Fr. *pureté*; Ital. *purezza*. (1) Of colour: the relative degree of saturation of a colour sensation; the distance of the 'colour' from the black-white axis of the colour pyramid.

(2) Of tone: the degree to which a tonal impression is free from overtones and concomitant noises.

(3) Of musical interval: the degree to which an interval approximates to the ratio of the 'just' as distinct from the 'tempered' scale; or, in general, the degree of accuracy of intonation. See Wundt, *Physiol. Psychol.* (4th ed.), i. 455; Stumpf and Meyer, *Zeitsch. f. Psychol.*, xviii. (1898) 321, for investigations into the sense discrimination of purity of intervals. (E.B.T.)

Purkinje's Images: Ger. *Purkinje'sche Bilder*, *Sanson'sche Bilder*; Fr. *images de Purkinje*; Ital. *immagini di Purkinje, di Sanson*. The three reflection images observable on the front of the cornea and front and back surfaces of the lens, whose changes of size and relative position demonstrate that the essential factor in accommodation is the changed convexity of the front surface of the lens; also called Sanson's images.

Literature: PURKINJE, De exam. phys. organi visus (1823); SANSON, Leçons sur les Maladies des Yeux (1837); SANFORD, Course in Exper. Psychol., expt. 108b; HELMHOLTZ, *Physiol. Optik*, 132; AUBERT, *Physiol. Optik*, 444. (E.B.T.)

Purkinje Phenomenon: Ger. *Purkinje'sches Phänomen*; Fr. *phénomène de Purkinje*; Ital. *fenomeno di Purkinje*. If the ordinary spectrum is darkened, the brightness values of its different parts, as seen by the normal (or by the dichromatic) eye after adaptation, change. The maximal brightness shifts from yellow to green; the long-wave end of the spectrum darkens, and the short-wave end lightens. This phenomenon, the relative brightening of blues in a faint light, was first observed by Purkinje (*Zur Physiol. d. Sinne*, 1825). (E.B.T.)

The change in relative brightness of its different parts persists when the spectrum has become so faint as to be quite colourless; and there is now no doubt that this supplementary vision of twilight (which is acquired only at the end of about twenty minutes) is due to the production in the rods of the so-called visual purple (or rod-pigment), which takes place in a faint light. This view was fully established by Parinaud, and has been since confirmed by various observers. For the argument see VISION. (C.L.F.)

Matters of theoretical importance are: (1) the coincidence of the colourless faint-light spectrum with the spectrum of total colour-blindness (Hering); (2) the non-existence of

the phenomenon in the fovea (v. Kries, *Zeitsch. f. Psychol.*, 1897, xv. 350; v. Kries and Nagel, *ibid.*, 1900, xxiii. 161). (E.B.T.)

The brightening (and whitening) of the blues in a state of approaching adaptation (when without doubt the visual yellow is the predominant substance in the rods) is what is commonly meant by the term *Purkinje phenomenon*; to distinguish from this the excessive brightening of what was green, which occurs after achromatic vision has set in (and when the rod-pigment is in the form of visual purple—the right colour for absorbing green light), it is desirable to have a different name; it may perhaps be called *the extended Purkinje phenomenon*.

For the two successive stages of the phenomenon, see an important paper by Tonn in the *Zeitsch. f. Psychol.*, viii. 280. He, however, at that time, followed König's view that blue-vision in general is mediated only by the visual yellow of the rods. (C.L.F.)

Purpose [Lat. *propositus*, from *pro*, before, + *ponere*, to place]: Ger. *Vorsatz*; Fr. *déssein*; Ital. *proposito*. A PROJECT (q. v.) which is adopted for execution but not yet executed.

A purpose is thus an END (q. v.) in the large sense (called 'remote' under that topic, except that its execution is deferred); it differs from intention in being limited to the elements actually present to the mind, i. e. in being a project. As related to plan, it is that for the realization of which the plan is adopted; that is, the plan is the means. See a similar distinction by Höfler (*Psychologie*, 518) between the German terms Plan and *Vorsatz*. (J.M.B., G.F.S.)

Puzzle Experiment and Blank Experiment: Ger. *Vexirversuch*, *Nullversuch*; Fr. *expérience de contrôle, attrape*; Ital. *esperimento dubbio, esperimento nullo*. In psychological researches, an experiment purposely inserted into a series, though not fulfilling the stated conditions.

Frequently used in the method of right and wrong cases and elsewhere as a control or check upon the regular experiments; for example, in a series where weights of 100 and 105 gr. are compared, some experiments may be given in which two weights of 100 gr. are compared; in testing discrimination of two points on the skin, if the points are to be maintained a fixed distance apart throughout the series, occasionally a single point only may be used. The effect of knowing that a puzzle experiment may occur is to diminish the subject's natural bias in favour

of certain of the possible answers; thus, in the first example, this knowledge checks the tendency to prefer the answers 'greater' and 'less' to 'equal'; in the last example there is less liability to judge the two points as two, in doubtful cases. In reaction-time research, a different stimulus from that agreed upon may be given in the course of the series, in order to arouse attention and prevent hasty or mechanical reaction; e. g. a word, in a series of single-letter stimuli.

The results of puzzle experiments are ordinarily not reckoned in the series. Hence the term blank experiment is sometimes used (cf. Külpe, *Outline of Psychol.*, Eng. trans.); the term puzzle experiment is preferred, as the equivalent of *Vexirversuch*, which is more commonly used by German writers than *Nullversuch*; objections urged against the term puzzle experiment apply with greater force to blank experiment. The latter term might be applied to experiments which fail to yield results through the fault of apparatus or subject (e. g. anticipation reactions).

Stud.* (1892), vii. 247; KÄMPFE, *ibid.* (1893), viii. 548 ff.; KÜLPE, *Grundriss d. Psychol.* (1893), 75 (Eng. trans., 72); TAWNEY, *Philos. Stud.* (1897), xiii. 163, and many discussions and researches with the method of right and wrong cases (cf. *PSYCHOPHYSICAL METHODS*). (H.C.W.)

Pyrrho. (cir. 365–cir. 275 B.C.) A Greek, the founder of PYRRHONISM (q. v.), the school of sceptical philosophy.

Pyrrhonism: Ger. *Pyrrhonismus*; Fr. *Pyrrhonisme*; Ital. *Pirronismo*. The doctrine of Pyrrho of Elis, which has been transmitted chiefly by his disciple Timon. More generally, radical SCEPTICISM (q. v.) in general.

Pyrrhonism, like the other post-Aristotelian SCHOOLS OF GREECE (q. v.), was primarily a theory of life rather than of knowledge. Like Stoicism and Epicureanism, it regarded repose of mind, imperturbability, as the goal—as the state of happiness (cf. also the ethical theory of Democritus, under PRE-SOCRATIC PHILOSOPHY, with whom Pyrrho may have been connected through Anaxarchus). This imperturbability or ataraxy of the Wise Man is the result of a suspense of judgment with regard to things, and this suspense in turn is due to the recognition that nothing can be known. This last doctrine was fortified

by arguments drawn in part from the relativism of Protagoras (see PRE-SOCRATIC PHILOSOPHY) and in part perhaps from Megarian dialectic. One perception or impression is *no more valid* (οὐ μᾶλλον) than another, and the same is true of opinions. The arguments or modes of producing this 'suspense' (ἐποχή) were called tropes, of which Aenesidemus formulated ten and Agrippa five. In the Middle Academy (see SCHOOLS OF GREECE) a less radical scepticism prevailed, called PROBABILISM (q. v.), after which the stricter Pyrrhonism was revived, with a less practical and more dialectical aim, by Aenesidemus (probably in the 1st century B.C.) and Agrippa. The chief sources are the writings of the physician Sextus Empiricus (about 200 A.D.), who represents a fourth attitude, *empirical* scepticism. See also SCEPTICISM.

Literature: V. BROCHARD, *Les Sceptiques grecs* (1877); N. MACCOLL, *The Greek Sceptics* (1869); ZELLER, *Stoics, Epicureans, and Sceptics* (1880); M. M. PATRICK, *Sextus Empiricus and Greek Scepticism* (contains

translations of Bk. I of Pyrrhonic Sketches, 1899). (J.H.T.)

Pythagoras. (cir. 582, date of death uncertain.) Was born on the island of Samos, and was very likely instructed by Pherecydes, the Syrian, and Anaximander. He spent many years in distant travels, and in early youth went to Egypt. Moved, when he was about forty years old, to Crotona, Lower Italy, where he founded a secret fraternity which aimed at political mastery, was impelled by mystical and ethical ideas, and was fortified by superior mathematical knowledge. It attained power in Crotona, if not in some other cities of Graecia Magna, but, before the death of Pythagoras at Metapontum, it was overthrown and dispersed. It still continued to exist as a secret philosophical sect and as a sort of mathematical guild, and for at least three centuries preserved a strict organization. See PRE-SOCRATIC PHILOSOPHY (Pythagoreans).

Pythagoreans (from PYTHAGORAS, q. v.): see PRE-SOCRATIC PHILOSOPHY (Pythagoreans).

Q

QUADRIVIUM — QUALITY

Quadrivium: see PHILOSOPHY, passim.

Quale: see QUALITY AND QUALE.

Quality (and **Quale**) [Lat. *qualitas*, from *qualis*, of such sort as: a word formed by Cicero (*Acad.*, I. vii. 25) to translate Gr. *ποιότης*, or *τὸ ποῖόν*—(C.S.P.)]: Ger. *Qualität*; Fr. *qualité*; Ital. *qualità*. Quality is used: A. Relatively, to denote that a given entity stands in certain relations to some other entity; B. Absolutely, as a class-name for certain kinds of entity (see REAL AND REALITY, III. 'Being').

A. (1) An entity may be said to be a quality of another when it bears to it any one of the relations usually expressed by PREDICATION (q. v.). In this sense it has no fixed correlative, and is contrasted only with 'relation'; all that can be truly asserted of any subject being an assertion either of its own qualities or of its relation to other subjects. Thus 'property,' 'predicate,' 'attribute' are roughly synonymous with it; the main differences being that (a) 'property' is also used of relations, not expressed by predication, which may hold of the subject in question; (β) 'predicate' has the correlative 'subject'; (γ) 'attribute' is usually confined to express relation to subjects which are regarded as substances.

(2) More commonly quality is restricted as follows:

(a) The subject of the quality may be merely one of its particulars or instances, i.e. exactly like it; in which case alone we use the expression 'This is the quality of that,' e.g. 'The quality of this relation is difference.'

(b) In the great majority of cases, quality is correlative to 'thing,' and denotes that of which an instance is part of the thing. In this sense it is contrasted not only with

relation, but also with quantity; one thing being said necessarily to differ from another either in quantity, quality, or relations, when by the quantity of a thing is meant either (if extensive) the number of instances of some quality or qualities, or perhaps (if intensive) the 'quantity' of some one instance of a quality. For the special cases of 'figure,' 'size,' and 'position,' see below, B.

(3) Quality appears to be used not only of the relation of a universal to that of which its instance forms a part, but also of the relation of that instance to the whole; e.g. we may say not only that two things have the same quality, but also that each contains a certain quantity of that quality or is composed of certain qualities. In this sense the relation of quality to thing would be that of an existent predicate to its subject.

B. (1) Quality is rarely used as a class-name for all entities which can stand in the relations defined under A (1); but this is the proper use of *quale*. *Qualia* are therefore universals, i.e. entities which must differ in kind from one another; and they are contrasted only with particulars, i.e. instances of universals, or entities which may differ from one another not only in kind, but also merely numerically. Particulars may be either instances of qualities (i.e. 'things,' in the sense in which a thing may be either simple or complex), or relations; but it must not be supposed that, e.g., difference, because it is called a relation, is not therefore a quale: it is a quale, and only particular instances of it, which alone can relate, are not qualia.

(2) Quality is used absolutely in senses corresponding to A (2) and (3), i.e. it is a class-name for particulars of universals or for

the universals themselves, whose particulars serve to distinguish from one another the composite existents usually called 'things.' The things most commonly spoken of are material things, and hence a quality usually means some one of the characteristics by which we distinguish these from one another. Of these characteristics there are two main classes: (a) those which occupy space, (b) those belonging to the space so occupied. Now it is plain that (b) cannot be reckoned as *parts* of material things, if by these be meant, as usual, what occupies space; and yet one of them, 'figure,' has almost universally been reckoned as a quality, and two others, 'size' and 'position,' are sometimes included among *primary* qualities.

The qualities, therefore, which have been divided into the two classes of *primary* and *secondary* have been grouped together, in spite of a difference of relation to material things; for all secondary qualities and one among the primary *occupy* space, whereas the other primary qualities express relations of what occupies space to different qualities of the space which it occupies. Thus 'figure' expresses the relation of a group of instances of one or more qualities to the quality of the volume which they occupy; 'size' or 'extension' is in part an expression of quantity, and would hardly have been reckoned as a quality, were it not that it also expresses the fact that the group of which it is predicated is correlated with a group having a different quality, namely, that which distinguishes spatial position from (e.g.) temporal position; and 'position' expresses relation to a particular part of space, involving quality only in the same sense as 'size.' These three are reckoned among qualities because they are *necessary* to define a causal unit, i.e. the effect a material system will have depends upon its configuration and the distance of its parts, and it must have some position; and they are reckoned among primary qualities because, in conjunction with one single quality occupying space (i.e. material substance), they are *sufficient* to define a complete causal system. Secondary qualities are, therefore, to be defined as those qualities localized in space, which are merely correlated with, and not necessary links in, the causal system of the material universe; and for this reason it is possible to hold the view, first associated with their name by Locke, that they are mere sensations, i.e. that their localization in space is purely erroneous.

History. Inquiry into the nature of quality begins with Plato, who clearly recognized the nature of universals, calling them εἶδη ('ideas'). He may thus be said to define *qualia*, the chief defects in his treatment being: (1) that he is inclined to attribute existence to them, (2) that he does not clearly recognize the nature of the particulars, which are to be contrasted with them. With regard to their relation to 'things,' he does not distinguish the types of predication, and is inclined to treat some relations as qualities of the things related. The terms ποιόν, ποιότης (of which the Latin equivalents *quale*, *qualitas* give us our words) were used by him in a sense roughly corresponding with A (2) and (3), B (2); but they were first elevated into technical terms by Aristotle, who makes ποιόν one of his categories. Aristotle recognizes the distinction of universals from particulars far less clearly than Plato, and hence is more involved in the modern confusion of A (2) with A (3). On the other hand, he makes a step towards the recognition of the difference between primary and secondary qualities, by reckoning position, size, and (possibly) figure as separate categories. This distinction was first clearly emphasized (though not as a doctrine of quality) by the atomistic philosophy of Democritus, adopted by the Epicureans; but the science of dynamics was not sufficiently advanced to demonstrate the unique connection of spatial determinations with material substance, and hence the Aristotelian view that causal relations must be expressed in terms involving secondary qualities was victorious in the ancient world—a view which is often loosely termed a 'qualitative' view of reality, as opposed to the 'quantitative' view of Democritus. This view was prevalent throughout the middle ages, leading, owing to the insufficiency for causal purposes of secondary qualities, to great abuses in the assumption of 'occult qualities.' The firm beginning given to the mathematical sciences at the Renaissance emphasized once for all the importance of the distinction between primary and secondary qualities, and led to the naming of them by Locke. But Locke's view—that the secondary were mere effects in us of things to which the primary really belonged—was, owing to Berkeley's criticism, quickly discredited except among certain materialists; nor has their relation in this respect and distinction from one another ever received an adequate treatment: in philosophy the 'qualitative' view of reality prevails. Quality, as one of

the four 'concepts of the understanding' from which Kant derives his four classes of categories, is equivalent to intensive quantity, 'quantity' standing for extensive; a usage which reflects the common treatment of extensive quantities as groups of particulars, each of which may be called a separate thing, whereas intensive quantities are treated as single predicates; but it has never established that confusion between quantity and quality which it implies. From Hegel proceeds a modern tendency to hold that the categories of quality, quantity, and relation are all self-contradictory, and to obscure the distinctions between them; but at the same time, consciously or unconsciously, a pre-eminence is assigned to quality, since some philosophers avow the view that relations are to be interpreted as qualities of the things related, and most imply that the most ultimate form in which all truths can be expressed is as predicates of several subjects, or, by preference, of one—mistakes which are chiefly due to the neglect of a thorough inquiry into the nature of predication and the consequent failure to perceive that even predicates are only related to their subjects, and that in several different ways. Cf. the following topics, and see LATIN AND SCHOLASTIC TERMINOLOGY (4).

Literature: LOCKE, *Essay on the Human Understanding*; SIGWART, *Logik*; BRADLEY, *Appearance and Reality*. (G.E.M.)

Quality (in grammar and logic). (1) Take a sentence in which a common noun or adjective is predicated of a proper noun, and imagine that there is something in the reality which corresponds to the form of the proposition. Then imagine that this form of fact consists in a relation of the objective subject, or substance, to one being, the same correlate for all cases where the same noun or adjective is predicated in the same sense, and that imaginary being, whether looked upon as real or merely as a convenience of thought, is a *quality*. Thus, if anything is beautiful, white, or incomprehensible, this consists in its possessing the quality of beauty, whiteness, or incomprehensibility.

(2) But in a more proper sense the term quality will not be applied when the adjective, like *incomprehensible*, is conceived as signifying a relation. Thus, whiteness will be, in this narrow sense, a quality only so long as objects are thought as being white independently of anything else; but when this is conceived as a relation to the eye, 'whiteness' is only a

quality in a looser sense. Locke defines quality as the power of producing an idea, which agrees with the above explanation tolerably.

Qualitas, having inevitably reached an excessively vague use, was in the Roman schools taken to designate almost any character or characters for which no other name was at hand. Thus arose a variety of special senses. Thus in grammar the difference between nouns which had a plural and those which had not was called a difference of quality; as was the difference between the personal pronouns and *qui, quis, &c.*

(3) In logic: the distinction between the affirmative and the negative PROPOSITION (q.v.) has been called the distinction of quality in propositions by all logicians, without interruption, from Apuleius, in the 2nd century of our era, to our own contemporaries.

Kant, in order to round out a triad, added a third quality, called LIMITATIVE (q.v., 1), that of 'Sortes est non homo,' with a distinction from 'Sortes non est homo.' This will not bear criticism; but Kant's authority and the force of tradition have caused it to survive. As long as the universe of characters is unlimited, it is obvious that any collection of objects have some predicate common and peculiar to them. This being the case, as ordinary syllogistic tacitly assumes it is, the distinction between affirmative and negative propositions is purely relative to the particular predicate. No doubt many logicians have assumed that negative propositions are distinguished from ordinary affirmative propositions in not implying the reality of the subject. But what, then, does 'Some patriarch does not die' mean? Besides, all admit that propositions *per se primo modo* do not imply the existence of the subject, although they be affirmative. At any rate, the resulting syllogistic, if consistent, is very objectionable. If, however, the universe of characters is limited, as it is in ordinary speech, where we say that logical inconsistency and mandarin oranges have nothing in common, then the system of formal logic required will be a simple case of the logic of RELATIVES (q.v.); but the distinction of affirmative and negative propositions will become material or absolute, the forms of simple categorical propositions then being:

Any *A* possesses every character of the group *β*.

Any *A* wants every character of the group *β*.

Any *A* possesses some character of the group β .

Any *A* possesses some character of the group β .

Some *A* possesses every character of the group β , &c.

(4) Quality, even in Aristotle, is especially employed to denote characters which constitute merits or demerits; and this word is remarkable for the number of specialized meanings that it bears. Since Kant it has been employed to designate the distinction of clear and obscure, or distinct and confused, &c. See the preceding topic.

Quality is distinguished as primary, secondary, secundo-primary, essential or substantial, accidental, manifest, occult, primitive, original, elementary, first, derived, real, intentional, imputed, passible, logical, propositional, active, alterant, affective, predicamental, &c. (G.S.P.)

Quality (mental or psychic): Ger. *psychische Qualität*; Fr. *qualité mentale*; Ital. *qualità mentale*. (1) Those attributes of mental contents which do not wholly consist in relations, and have a distinctive character which is not merely constituted by their being more or less than something else.

(2) See SUBSTANCE (4).

The quality of contents of consciousness as such is distinguished from such quantitative attributes as INTENSITY, EXTENSIVITY, and COMPLEXITY. See those terms. (G.F.S.—J.M.B.)

Quality and **Quantity** (aesthetic). Aesthetic value may be considered under two aspects, quantity and quality, according as it is referred to the magnitude and numerical relations of the aesthetic object or its elements, or, on the other hand, to the intrinsic nature of the object or elements.

Under quantity fall, e.g., limit, rhythm, numerical unity, multiplicity, magnitude (the great, vast, little, pretty), symmetry, proportion, &c.; under quality, the characteristic, significant, charming, unity of kind, contrast, harmony, &c., with various modifications such as the tragic and comic.

The logical terms quantity and quality were applied to the aesthetic judgment by Kant, but in the sense above noted the aesthetic usage was introduced by Herbart and Zimmermann and elaborated by Köstlin.

Literature: ZIMMERMANN, *Asthetik* (1865), 36ff.; KÖSTLIN, *Asthetik* (1869), 76ff. (J.H.T.)

Quantification of the Predicate: see QUANTITY (in logic).

Quantitative Hedonism: see HEDONISM, and ETHICAL THEORIES.

Quantity [Lat. *quantitas*, amount, from *quantus*, how much]: Ger. *Quantität*; Fr. *quantité*; Ital. *quantità*. (1) The experience and attribute of more or less. (J.M.B.)

(2) Notion of: the thought of the existence of parts within a whole considered in abstraction from the special nature of the parts or of the whole. (G.F.S.)

The fundamental conception of quantity is expressed in the so-called axiom, 'the whole is greater than the part.' In reality, this is a definition; for the whole is a whole just because it is greater than the part, or, in other words, includes the part. It is true, of course, that one whole may be greater than another. But this means the first may be conceived as included within the second; it means that the first might be conceivably substituted for a part of the second. Here it is necessary that the special nature of the whole or its parts should be more or less completely abstracted from. Let one whole be a group of three sheep and the other a group of five. It is obvious that this particular collection of three sheep cannot be contained in that particular collection of five. But if we abstract from the individual identity of the particular sheep, and consider them only in their general character as belonging to the class sheep, the substitution becomes possible. The group of three is smaller than that of five because it could be substituted for a part of the five group, without making any difference to it, considered abstractly not as a collection of just these sheep, but of any sheep whatever. The same holds good for a group of three sheep and another of five cows, if we abstract not only from individual identity, but also from the specific nature of sheep and cows, and consider them merely as animals. The final abstraction is reached, so far as discrete quantity or number is concerned, when we consider the components of a group merely as distinguishable objects of thought. Cf. NUMBER CONCEPT.

The same analysis applies in principle to continuous quantity. A continuous quantum contains parts which by their nature are not separately distinguishable, and therefore cannot be expressed by a number. But this makes no difference to the general concept of quantity. One line in space is greater than another when, on abstracting from difference in position, &c., we see that the second could be substituted for a part of the first without making any difference to it.

The greatest difficulty arises in the case of

QUANTITY

intensive quantity (cf. INTENSITY AND INTENSIVE MAGNITUDE). For here we seem to have a difference of more and less without any relation of whole and part. For instance, a sound of a given degree of loudness does appear to be composed of partial loudnesses, and it seems meaningless to speak of a lower degree of loudness as conceivably included within or substituted for part of a higher degree of loudness. We may, indeed, consider intensive quantity as immediate experience, falling under definition (1).

The notion of intensive magnitude may, however, be regarded as implicating parts, though none of them are separately distinguishable within the whole. In this it differs from a continuous extensive quantum. For in a continuous extensive quantum we can distinguish and count an indefinite number of parts. The continuity consists in the fact that however many parts we distinguish, there are still other parts undistinguished. For each assignable part is itself indefinite, divisible into other parts. In the intensive magnitude, on the contrary, there are no assignable parts at all. None the less, it may be maintained that though not separately distinguishable, they may be supposed to exist, and that the supposition is implied in speaking of an intensive quantum at all. The only admissible alternative seems to be the denial that what is called an intensity is a quantum at all—at least, if we consider it by itself, apart from comparison with other similar presentations.

From this point of view it may be held that what is called intensive quantity presupposes the serial arrangement of sensations according to their degrees of resemblance and difference. It is not the separate sensations but the interval between them in the series which is quantitative. Suppose that we are considering, instead of two sounds, two pairs of sounds. Symbolize the one pair by A and B , the other by α and β . We find that we are able to judge whether the difference in loudness between A and B is or is not the same with the difference in loudness between α and β . Thus we can form a series or scale of loudnesses passing from one to another by intervals which we judge to be equal. By counting these equal intervals we can assign a numerical value for the place of any sensation in the series, and this is what is meant by its intensive quantity. This view seems unable to avoid the fallacy of explaining in a circle. For the intrinsic intensity of each

sensation it substitutes degrees of resemblance. But what is a degree of resemblance if it is not an intensive quantity?

The psychological development of the cognition of quantity consists in the gradual abstraction from other characters of the object and the fixing of attention merely on the relation of whole and part as such. Every object of consciousness is or implies the unity of a manifold, and has therefore a quantitative aspect. Hence quantity is presented in every objective experience. But it is only by a long process that it comes to be separately contemplated. The abstraction is a mental experiment which justifies itself by its fruitfulness. In fixing attention exclusively on the quantitative aspects of objects the mind finds opened out before it a vast system of numerical and other relations having the character of necessary truths.

The justification of definition (1) is found in the fact of quantitative experience, which is not, however, brought into relation of whole and part with other experiences.

For Kant's doctrine of quantity as belonging to the ANTICIPATIONS OF EXPERIENCE, see that topic.

(G.F.S.—J.M.B.)

Quantity (aesthetic): see QUALITY (aesthetic).

Quantity (in logic and mathematics). (1) Any ACCIDENT (q. v.) whereby a substance has part outside of part. Cf. QUANTITY (2).

This is the old definition; and it is true to the old meaning of the word in representing quantity as much more concrete than the modern conception. Quantity (see Aristotle's *Praedicamenta*, vi) is either discrete or continuous. Continuous quantity is either magnitude or time. The old definition of mathematics as the science of quantity is misunderstood, if quantity is here taken in the modern sense; it was only meant that mathematics treated of accidents having number, magnitude, or duration. There was therefore a mathematics of music.

(2) In the general modern sense, quantity is a system of serial relationships.

Serial relationship differs from transitive relationship merely in the point of view, and (so closely connected are the two points of view) in hardly more than the mode of expression. Now, all transitive relation is traceable to inclusion. Hence, quantity might be defined as a system of inclusions looked upon as serial. It is very important to understand that quantity is a mere system of relative ordinal relations in a linear series.

Each complete determination of quantity in a given system is a 'value.'

Quantity is either counted or measured. Counted quantity may have a finite multitude of values. Of systems of quantity of denumeral multitude, the simplest is that of the integer numbers. The system of rational fractions is the only other familiarly used. These fractions can, in several ways, be arranged in their order of quantity by mere counting.

(3) Concepts, or terms, are, in logic, conceived to have *subjective parts*, being the narrower terms into which they are divisible, and *definitive parts*, which are the higher terms of which their definitions or descriptions are composed: these relationships constitute 'quantity.'

This double way of regarding a class-term as a whole of parts is remarked by Aristotle in several places (e.g. *Met.*, Δ. xxv. 1023 b 22). It was familiar to logicians of every age. Thus Scotus Erigena calls logic 'ars illa quae diuidit genera in species et species in genera resoluit.' John of Salisbury refers to the distinction as 'quod fere in omnium ore celebre est, aliud scilicet esse quod appellativa [i.e. adjectives and the like] *significant*, et aliud esse quod *nominant*. Nominantur singularia, sed universalia significantur.' For William of Auvergne, see Prantl, iii. 77. The writer has a long list of similar passages before him. But the Aristotelians had their minds upon the discrimination of different kinds of predication, and insisted that the differences of different genera are different, thus forbidding cross-divisions. Arnauld, however, in *l'Art de penser*, conceives all predicates, or all essential predicates, as alike, without distinguishing *genus* and *differentia*; and was so led to devote a short chapter (vi) to *l'étendue* and *la compréhension* before taking up the predicables. But his services in the matter have been grossly exaggerated, and it really seems to have been Kant who made these ideas pervade logic and who first expressly called them quantities. But the idea was old. Archbishop Thomson, W. D. Wilson, and C. S. Peirce endeavour to make out a third quantity of terms. The last calls his third quantity 'information,' and defines it as the 'sum of synthetical propositions in which the symbol is subject or predicate, antecedent or consequent. The word 'symbol' is here employed because this logician regards the quantities as belonging to propositions and to arguments, as well as to terms. A distinction of *extensive* and *comprehensive dis-*

tinctness is due to Scotus (*Opus Oxon.*, I. ii. 3): namely, the usual effect upon a term of an increase of information will be either to increase its breadth without diminishing its depth, or to increase its depth without diminishing its breadth. But the effect may be to show that the subjects to which the term was already known to be applicable include the entire breadth of another term which had not been known to be so included. In that case, the first term has gained in *extensive distinctness*. Or the effect may be to teach that the marks already known to be predicable of the term include the entire depth of another term not previously known to be so included, thus increasing the *comprehensive distinctness* of the former term. The passage of thought from a broader to a narrower concept without change of information, and consequently with increase of depth, is called *descent*; the reverse passage, *ascent*. For various purposes, we often imagine our information to be less than it is. When this has the effect of diminishing the breadth of a term without increasing its depth, the change is called *restriction*; just as when, by an increase of real information, a term gains breadth without losing depth, it is said to gain *EXTENSION* (q.v., in logic). This is, for example, a common effect of *induction*. In such case, the effect is called *GENERALIZATION* (q.v.). A decrease of supposed information may have the effect of diminishing the depth of a term without increasing its information. This is often called *abstraction*; but it is far better to call it *pre-scission*; for the word *abstraction* is wanted as the designation of an even far more important procedure, whereby a transitive element of thought is made substantive, as in the grammatical change of an adjective into an abstract noun. This may be called the principal engine of mathematical thought. When an increase of real information has the effect of increasing the depth of a term without diminishing the breadth, the proper word for the process is *amplification*. In ordinary language, we are inaccurately said to *specify*, instead of to *amplify*, when we add to information in this way. The logical operation of forming a hypothesis often has this effect, which may, in such case, be called *supposition*. Almost any increase of depth may be called *determination*.

(4) Syllogistic is sometimes regarded as the mathematics of a system of quantities consisting of but two values, *truth* and *falsity*.

(5) The quantity of a proposition is that respect in which a universal proposition is regarded as asserting more than the corresponding particular proposition: the recognized quantities are UNIVERSAL, PARTICULAR, SINGULAR (see those terms, in logic), and—opposed to these as 'definite'—Indefinite. *Quantitas* is used in this sense by Apuleius.

Quantification of the Predicate. The attachment of signs of propositional quantity to the predicates of simple propositions is called by this name. The *dictum de omni* defines the relation of subject and predicate, so that 'Any *A* is *B*' is to be understood as meaning 'To whatever *A* is applicable, *B* is applicable.' But this definition must be modified, in order to give any room for a quantification of the predicate. If then we are to take *all* and *some* in their proper distributive senses and not in collective senses, to say that 'Every man is every animal' would, as Aristotle remarks, be absurd, unless it were meant that there was but one man and one animal, and that that one man was identical with that one animal. This system has never been proposed. But Hamilton, with his followers, T. S. Baynes and Calderwood, take the marks of quantity in a collective sense. They thus have, as one of the propositional forms, 'Some man is not some animal,' which precisely denies 'Every man is every animal,' in the distributive sense, and is entitled to an equal standing in logic. It does not deny 'All man is all animal,' in the collective sense of these logicians. This system had some vogue in its day.

De Morgan's system of Propositions. This permits the retention of the *dictum de omni*, merely applying propositional quality to the subject. We thus get the following eight forms of proposition:

-) To whatever *A* is applicable, *B* is applicable.
- (.) To whatever *A* is inapplicable, *B* is applicable.
-)-(To whatever *A* is applicable, *B* is inapplicable.
- ((To whatever *A* is inapplicable, *B* is inapplicable; i.e. To whatever *B* is applicable, *A* is applicable.
- () To something to which *A* is applicable, *B* is applicable.
- .(To something to which *A* is applicable, *B* is inapplicable.
- .)-(To something to which *A* is inapplicable,

B is applicable; i.e. To something to which *B* is applicable, *A* is inapplicable.

)(To something to which *A* is inapplicable, *B* is inapplicable.

The above is substantially one of De Morgan's own forms of statement, called by him onymatic. There is no objection to this system; but it is an idle complication of forms which does not enable us to take account of any mode of inference that the old system does not cover. Still it does away with the figures of syllogism. But whatever the merits or demerits of the system, De Morgan developed it with logical elegance. (C.S.P.)

Quantity (in physics). A magnitude which admits of precise comparison or measurement. Usually limited to concepts expressed by algebraic symbols. Cf. the other topics QUANTITY, also VALUE (in mathematics). (S.N.)

Quantum [Lat.]. Determinate QUANTITY (q. v.).

Quicunque. A designation of the ATHANASIAN CREED (q. v.) from its introductory words *Quicunque vult*, Whosoever will. (A.T.O.)

Quiddity (**Quid, Quod, Quo, Quem**, in phrases) [Lat. *quidditas*, *quid*, what]: Ger. *Quiddität*; Fr. *quiddité*; Ital. *quiddità*. See LATIN AND SCHOLASTIC TERMINOLOGY (4, 5).
